It is not from any lack of ability as a figure draughtsman that Mr. G. WOOLLISCROFT RHEAD has prepared alphabets of Roman capitals as examples for lettering as well as for elementary freehand drawing. The lettering on the pedestal of the Trajan Column relates to the elevation by the Senate and people of the memorial of the Emperor's German and Dacian victories. Although there are seven lines, the whole alphabet as known to the Romans was not employed in the inscription. If judged by a modern test the letters H, J, K, U, W, Y, Z are omitted, but it is not a difficult operation to design those letters in a manner in keeping with the remainder. The Romans did not always adhere to uniform proportions; for some of the letters a square was employed as a basis, but in others the width is less than height. Better models for capitals of the class are not to be found. In addition three sets of "lower case" alphabets are given. The outlines are drawn with great boldness and decision. On that account they are well adapted for imitation by students of elementary freehand drawing. The collection is published by Mr. B. T. BATSFORD.

At the convention of the American Institute of Architects in 1890 papers were read on the Gardens of Italy, England, France and Japan. These papers have been edited for the Institute by Mr. GLENN BROWN, and are now published by Messrs. H. T. COATES & Co., of Philadelphia. The volume is not large, for there are only about 160 pages, but as on every page we have one or more illustrations, mainly from photographs, it will be evident that justice is done to the subject. The plates give what may be called bird's-eye views of the most important varieties of European gardens. The authors, Mr. HAMLIN, Mr. STURGIS and Mr. HOWARD, are American architects. In addition, the paper on Japanese landscape gardening is not only a revelation, but it will help to explain some of the decorative elements we see in Japanese work. The fences, gateways, bridges and harbours suggest that we might often take hints from the East. The only drawback is that we do not possess the bamboo which lends itself to so many purposes in Japan. For all lovers of the architectural garden the Institute manual will be reminiscent and advisory.

ALTHOUGH the population of Luxembourg is only about 21,000, the capital of the Grand Duchy is of some historic importance. It has many institutions of interest, such as galleries of antiquities and paintings, libraries, &c. The population is mixed, but the greater number are Germans. The authorities of the capital in all questions however remotely relating to art, look to Paris for guidance rather than to Munich or Berlin. The equestrian statue of WILLIAM II., the Grand Duke, which is the most important work of its class in Luxembourg, was modelled by M. MERCIÉ, the French sculptor. It is now proposed to carry out some alterations in the city, and to erect public monuments of various kinds. For that purpose the counsel of M. BOUVARD, the architectural director to the Paris Municipality, have been invoked. The old fortress, with its heptagon outworks, was constructed during the Spanish occupation, and enlarged by VAUBAN, but is no longer useful for defence. Accordingly the site, as well as the old ramparts, will be changed into promenades under the direction of two French specialists, MM. ANDRE. From what has been done it will be evident that the capital will soon have an outer boulevard which will be one of the most interesting in Europe. Lastly, M. SÉJOURNÉ, a French engineer, has been commissioned to design an arch of masonry over the valley of the Petrusse, having a span of no less than 250 feet.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair.

The PRESIDENT said his first duty was a sad one, as he had to announce to the meeting the passing away of a very great man, a member of their profession, Mr. F. C. Penrose, who died on Sunday afternoon. The funeral would take place on Thursday. Continuing, the President said it was naturally the desire of the Council to approach the Dean and Chapter of St. Paul's with the request that the body of the surveyor of the fabric should be laid in that building, but the Council were led to understand from Dr. Penrose, the son, that it was the wish of the family and also that of the late Mr. Penrose himself that he should be laid in the churchyard near which he lived in Wimbledon by the side of his wife, whose death preceded his by a few days. The Council therefore proposed to respect the wish of the family and not to approach the Dean of St. Paul's; but the Council hoped that in due course they might see a memorial to Mr. Penrose erected in that building on which for so many years he bestowed so much loving care. It was hardly necessary to say anything to the meeting in reference to the life of their past President; he was too well-known by the members. Mr. Penrose was born in 1817, and was therefore eighty-five years of age. Many of the members would remember that only a few weeks ago he stood in that room and gave them a paper on the volute in Greek architecture. Mr. Penrose seemed then as young and as earnest as he ever was, such was the zest and interest he put into the subject. The President added that it was not his intention to enter upon any details of the deceased's life's work; it would be better and more worthily done by a notice in the Institute Journal, but he reminded them what a wonderful and many-sided man the late Mr. Penrose was. Educated at Winchester and Cambridge, he gained a mathematical degree. The development of body as well as mind formed part of his early training, and he rowed in the University boat for two years. In the first years of his architectural practice he erected many buildings. Mr. Penrose was one of the architects selected to prepare a design for the alterations in the National Gallery. In addition he was a man of extraordinary scientific and intellectual ability, and produced one or two books which would live as long as interest was taken in ancient architecture. His "Principles of Athenian Architecture" was his chief work, and he pointed out the many minute refinements in Greek architecture which had not been discovered before his researches. He was also a great astronomer, and had published books on the subject. This science led him to propound theories as to the orientation of temples, and one of the last researches he entered upon with great interest was the orientation of the Druidical remains at Stonehenge, and he carried out a large number of most careful calculations with Sir Norman Lockyer. As a man they all knew and respected, they loved him very much. He had a power of intellect and simplicity of mind which won the constant admiration of all who came in contact with him. He acted as President of the Institute for two years, and performed his duties without flinching. For many years he attended the excursions of the Architectural Association, and sketched and worked with the younger students, many of whom could recall pleasant recollections of the great man on those occasions. In conclusion, the President moved a vote of condolence and sympathy with the family of the deceased.

Mr. BASIL CHAMPNEYS, B.A., read a paper on

The Planning of Collegiate Buildings.

He treated of such types of collegiate architecture as could be dealt with by one with such authority as practical experience might justify. Briefly touching upon the archaeological aspect of the subject, reference was made to the changes of custom which had served to modify the standard set up by the old builders, and to the different conditions now to be provided for. When the old buildings were erected, students entered on their University careers at a much earlier age than now; the standard of expense, too, was very much lower. Nowadays the University is considered the privilege of the more wealthy; formerly it was designed for all who had sufficient ambition or enterprise, and offered every facility to those who were prepared to face poverty and hardship in the pursuit of mental training. While the change in the age of the students revolutionised the arrangements of rooms, the increased size and scope of the colleges afforded occasion for larger and more comprehensive schemes of planning, and made effective grouping of the buildings possible. The great increase in size opened the way to the development of collegiate planning on an extensive scale, and suggested the type which nearly all existing colleges to some extent illustrate—the grouping of the buildings into one, two, or more quadrangles of rather low buildings (in the original colleges there were never more than two floors and an attic), from which the special and more important feature, the chapel, the hall and the library, stand out as salient features.

The lodgings of the president, warden, principal or master were usually included in the general grouping, and are seldom distinctive features in the older college buildings. In the present day the head of the college usually requires a more sumptuous abode, which must become an important item in contemporary college architecture; while the fact that many of the tutors and fellows are now married will also serve to complicate the future of collegiate grouping.

For the students' rooms the general arrangement was almost invariably as follows:—A staircase, entered from the quadrangle, led to rooms on either side, and as there were three floors, opened into six sets. This arrangement is usually adhered to in contemporary schemes, and, Mr. Champneys thought, with good reason. In the few cases in which a departure from the ancient type had been attempted, the result seemed to be unsatisfactory and destructive of collegiate character. As examples Mr. Butterfield's buildings at Keble were cited, where it would have been far more satisfactory had the ordinary rooms been planned upon the old-established system; the new buildings at New College erected by Sir Gilbert Scott about 1876, and a new group of buildings built by Mr. Bodley at King's College, Cambridge. In both the latter instances the fourth storey, which the author considered subversive of collegiate effect, had been, he believed, forced upon the architects largely, no doubt, from motives of economy. There was, however, no economy secured by this piling up of buildings. He had tested the comparative cost of buildings of two, three, or more storeys, and had found that a building of two storeys, floors of moderate height, was definitely more costly for the same accommodation than one of three, but four or more floors were not more economical than three.

The old system of college planning needed but few modifications to bring it up to date. A few practical requirements consequent on the change of custom have to be met. It is essential that living-room, bedroom and cupboard, or "scout's hole" or "gyp-room," should be independently accessible, though there is some advantage in having a door between the sitting-room and bedroom, as it allows the bedroom to some extent to benefit by the sitting-room fire, and enables the occupant to obtain more breathing space at night. The "scout's hole" or "gyp-room" need be little more than a mere cupboard; one of the most modern ideas is to provide for a group of rooms a kind of general "scout's hole" or pantry, with a sink and gas-stove, &c. These are the principal points in which a modern set of rooms differs from the ancient type, which, on the whole, has vindicated its claim to be applied to modern schemes as the best and most economical arrangement.

As an example of the most highly developed idea of a Mediaeval college, New College at Oxford was cited, which in its ancient form showed a complete design carried out at one time. In order to realise Wykeham's idea it is necessary to remove in imagination certain later additions which have obstructed the original intention. Chief of these is the addition of a storey to the main quadrangle. This raises the buildings to the same level as the gateway tower which originally surmounted them, and also decreases the predominance of the chapel and hall. William of Wykeham was a great Churchman, and his intention was to make the chapel the chief feature of his main quadrangle. The great height and scale still preserves its relative importance, but its predominance over the residential portion of the quadrangle is much hampered by the added storey. The marked predominance of the chapel over the adjoining buildings, the cloister and the tower, are somewhat exceptional features in college architecture, and serve to emphasise the ecclesiastical intention of the founder. The same idea is manifest in a college of modern foundation—Keble—which, as a memorial to a well-known Churchman, was founded with a somewhat similar view. Other colleges which bear the impress of a specially ecclesiastical ideal are Christ Church and Magdalen at Oxford and King's at Cambridge. In the more ordinary type of college the chapel hall and, in many cases, the library are salient features in the grouping, but their relative importance varies very considerably.

A new phase of collegiate life which involves certain modifications of the original type of building is the establishment of colleges for women both at Oxford and Cambridge. Life in these must necessarily be of a more domestic character than in colleges for men, and, if the style of architecture follows the requirement, the result will be something which may be called "domestic collegiate." Access to the several students' rooms can no longer be from staircases entered direct from the open air; the approaches must be properly enclosed and the passages warmed. In the building illustrated by the author—Newnham College at Cambridge—the deviation from the original type is greater, because the system of the college is that of subdivision into halls, each of which is on the whole complete in itself (a reversion, as it happens, to the original arrangement), the only features used equally by the entire college being the great hall and the library, the lecture-rooms and the laboratories. Moreover, the scheme as it now stands

has been developed piecemeal; has started from small beginnings and grown up step by step, each instalment of the group of buildings having been supposed at the time of its erection to be the last until the pressure of applicants suggested a further extension.

Another building referred to as deviating from the original type on account of a change of purpose was Mansfield College, which contains all the features of a college without residence for students. It consists of a chapel, a hall and common-rooms, with the requisite offices, bursar's and tutors' rooms, a few bedrooms, several lecture-rooms, a large library and a principal's residence. Plans of the building were exhibited to show how the various requirements had been met.

In conclusion, reference was made to the most modern type of collegiate arrangement, viz. that designed to meet the requirements of elaborate scientific training. To get an idea of the complicated planning involved in a very moderate portion of these requirements, the author advised his audience to read the papers on "The New Science Laboratories at University College, London," read before the Institute in March 1894.

Professor FAWCETT, M.A., who proposed a vote of thanks to Mr. Champneys, said the paper had naturally been of great interest to him, although he only knew intimately one side of the question. He did not know Oxford quite so well as he did Cambridge. The old system of college planning seemed to have been taken from the old manor-houses of early date. They were conventional buildings of the domestic character of the time. This arrangement seemed to have been universally accepted as the right one. With the introduction of colleges for women a totally different change was made in the planning, and instead of taking Mediæval manor-houses as an example, architects had been guided by the modern house, with all its luxury, and nearly all new colleges had been built on those lines.

Mr. W. D. CARÖE, M.A., seconded the vote. He said all who had seen Mr. Champneys's works both at Oxford and Cambridge must feel that he had carried out not only the ancient planning which had been described so well, but had also carried the charming feeling of that ancient architecture a step further than his predecessors.

The PRESIDENT briefly concluded the discussion, and the meeting terminated.

WHAT IS THE REAL VALUE OF GREEK WORK TO THE MODERN ARTIST?*

(Concluded from last week.)

IN Germany they have a very useful substantive "tectonics," by which is meant the philosophy of construction. "Tectonics" embrace the underlying principles of all constructive art, whether this be applied to the making of a teacup and a cabinet or a great architectural monument. An apprehension of these principles belongs, of course, to every competent architect and designer. There is no mystery about them. Just as in Molière's comedy, M. Jourdain has been talking prose all his life without knowing it, so the practising architect of our own day and country has been carrying out "tectonic" principles without, perhaps, ever hearing the somewhat outlandish adjective. It is well, however, occasionally to disentangle general principles from their practical application, and to study them apart as representing an abstract standard to which all practice has to conform. Greek art is most educational when it leads us back to these general principles that apply to all the varied operations of the arts, and it may repay us to consider for a few moments what "tectonics" imply, and how tectonic principles are illustrated in the work of the Greeks.

In the first place, then, the student of tectonics will apprehend the characteristics of different materials and the methods by which these materials are put together, and will discriminate the forms naturally produced by one substance and method of construction from those that are the outcome of other materials and processes. Consider how many solecisms in design, how many contradictions and inconsistencies would be saved if these fundamental facts about materials and processes were always clearly before the minds of constructive artists.

In the second place there will follow on the study here recommended a due apprehension of the principles of effective, as well as of sound and consistent design. There will be an understanding of the value in any complex composition of a base plinth or pedestal to give the structure or object a proper stand; of a cornice, cresting or other crowning feature to provide it with a finish above; of framings of various kinds to give value to particular portions; of mouldings and similar features which assist composition by connecting part with part and furnishing guiding lines to unify the effect of the complex whole. Here, again, it is a most salutary process not only for

the learner, but also for those already immersed in practical operations, to train the mind to get below the special form, say, of mouldings of the different Gothic periods or of Doric caps or Ionic cornices, down to the fundamental idea of moulding, a cap or a cornice in the abstract. The intention and significance of such details in themselves is something prior to the special shapes which they assume in this or that particular architectural period, and there are many students who could sketch the profiles of all the mouldings of the "styles" in half an hour, but who have never really argued for themselves, as a matter of principle, the artistic function of the moulding in its general idea as an aid to architectural composition.

In the third place, the principles of the placing and the selection of ornament are corollaries from the more general principles of tectonics. From an intimate knowledge of structure follows discernment of the fitting scheme for the distribution of ornament, the placing of which in its relation to the fabric is one of the most important matters for the designer to understand, while an apprehension of the different characteristics of materials leads to an instinctive judgment of what sort of ornamental treatment is suitable for each. A phrase just used suggests a word of comment. The phrase in question is "the principles of the placing and selection of ornament." It would seem more natural to reverse the order, and to say "the selection and the placing of ornament," for to most lay people and to many designers the ornament is a thing apart that has to be chosen for reasons of beauty or interest or symbolism, and applied later to the fabric in some convenient position where it will "go" or will "look well."

If, on the other hand, we regard ornament from the tectonic point of view, we find that it is the placing which is the important matter, and the actual character of the motives a quite secondary consideration. In other words, ornament as enrichment, as the diversifying of a surface with light and shade or colour, is prior to ornament considered as the display of leaves and flowers or beasts or human shapes. Ornament which grows, as all ornament should grow, out of structure or material is primarily enrichment, and not representation. Its representative character comes into consideration only after its place and general artistic effect are properly determined. What, now, do we learn from Greek architecture about these principles of ornament?

In the first place, we learn to keep distinct in our mind two things which in modern practice are often confused—ornament and the detailed treatment of features. By the detailed treatment is meant such things as the fluting of columns, the curving of the echinus, the profiling of mouldings. This is not ornament. The purpose of a detailed treatment of the kind for architectural members is to emphasise function and make clear the relation of parts. It makes the particular feature what Boetticher called an "art form"—that is a member of the structure which receives a special shape and finish with a view to making it expressive of its place in the organism of the whole. So the fluting, the tapering, the entasis, the necking of the Doric shaft are all intended to force on the spectator the impression of the work the column has to do and its relation to the rest of the fabric. It would be wearisome to attempt an analysis of the various forms used in Greek architecture, so as to show how in each case the general shape and the finish of details were not matters of chance or of fancy, but of deliberate artistic intent. By this, of course, is not meant that they followed any abstract formula, or were reasoned out in black and white as an engineer makes his calculations. The whole process of their creation and elaboration was an artistic one, just as the process of balancing pressure against pressure, an weight against support, in the French Gothic cathedral was one of tact and intuition, and not of formula and figuring.

This significant vesture, in which the architectural forms of the Greek temple were clothed, is something quite different from ornament. Ornament is abundant on very early buildings in Greece, but in the Doric temples of the severe archaic style it is sparingly introduced, while the tectonic details, especially those of the necking of the capital, are tolerably pronounced. The mouldings of the early Doric style, especially the undercut hawkbeak moulding, are carried pretty far in their profiling, but the carefully composed contour is no ornament. When at a later time the same moulding is carved into the egg-and-dart or the Lestrian cymatium, then there is ornament, but the profiling and the enrichment are, artistically considered, two quite different things.

On the Doric buildings of the normal type, represented, of course, centrally by the Parthenon, ornament takes its place as an important part of the effect of the whole. It is not so important that we can hold with Ruskin that the whole of the architecture of the building is a mere scaffolding for the support, a framing for the display of the carved enrichment, but we cannot properly consider the monument without taking account of the figures in the pediment, the storeyed metopes and the frieze. And it is one of the most instructive features of this central example of Greek work at its highest point in

* A paper read before the Architectural Association by Professor G. Baldwin Brown on Friday evening, February 6.

sign and execution, that the placing and the character of the ornament are just as much matters of logical principle as is the constructive skeleton. The principle on which the Greeks placed their ornament upon any complex structure, such as a building or piece of furniture, has been so often discussed that it ought, perhaps, to pass it over as something which, like the justice of Aristides, can be taken for granted. Gottfried Semper, whose work on "Style in the Technical and Tectonic" is the Bible of æsthetic principles, as they are understood by the artist rather than by the literary critic, was the first to point out the true relation of ornament to structure as illustrated in the work of the Greeks. There is a well-known errorism of Owen Jones in the letterpress to the "Grammar of Ornament" to the effect that we are not to construct ornament, but to ornament construction. The statement is grammatic, but as it stands misleading. To ornament construction, if it mean to lavish enrichment on the parts which usually form the skeleton or framework of the fabric, is contrary to sound principles, and is quite opposed to the practice of the Greeks. The phrase should be expanded to mean that ornament should always bear a due relation to construction. It is not a fact that construction is to be adorned, but construction provides the places where ornament may fittingly be played. The Greek practice was to choose for the location of ornament intermediate spaces, or points of rest as they have been called, in the construction, so that the beautiful and significant forms of the enrichment should be displayed where no actual work is being done by the members that form the structural framework of the whole. In this arrangement there is no conflict in our minds between the impression we receive from the structure and that which comes from the ornament. In any complex whole compacted of parts, one ought to be able to see at a glance what is the constructive action in each of the members that is really essential to the fabric. In the Greek façade this is particularly clear, for the contrast of the supporting members, the columns, with the responding horizontal of the architrave, takes the eye in a moment. It is the function they are seen to fulfil that gives them their interest for us, and the Greeks kept these parts simple and in order that attention should not be distracted from the constructive significance which in their case is all-important. The fluting and other details of the column are not, as we have seen, of the nature of ornament, but are intended to explain the position and function of the column in the structure. The sculptural enrichment of the Doric temple is practically confined to three positions—the frieze, the pediment and the acroteria, for the lions' heads along the cyma which act as gargoyles are exceptional features, partly tectonic and partly ornaments. In the Doric frieze the triglyphs are clearly structural features, short pillars repeating in their right grooves the fluting of the column shaft below, and promising thereby their function as supports for the third stage of the building, the cornice. The metopes, set back a little and the face of the triglyphs, are points of rest where no actual work is actually being carried on, and when the eye rests upon these there is nothing to distract attention from the ornament which is there displayed. The same may be said of the triangular field of the pediment, and as regards the acroteria, we have in the figures or ornaments exposed against the sky a crowning finish that sits lightly on the mass and is of all structural relation thereto. So far the distribution of the ornament in its relation to the structure.

If now we examine a little more narrowly the character of carved enrichment, we discern another artistic principle of great value. Not only should ornament be intelligently related to the framework of a structure, it should proclaim itself a part of the fabric in that it blossoms out from it at the right points, after the fashion of organic growth. From this point of view, interesting to note how recent ætiological discoveries seem to show that the sculpture on metopes and pediments is not to be regarded as so many pieces and groups in the round, independently made and set in niches or blank spaces on the building, but as reliefs on the surface of originally plain slabs of stone that backed the ornament or filled the intervals between the triglyphs. The best metopes from Selinus in Sicily, in the museum at Palermo, show this, because, though the relief is very high and figures in part detached from the ground, yet a portion of the original slab is left all round the figures as a sort of framing, and is from the tectonic point of view the most important part of the whole. One of the most archaic of all extant pedimental positions, found some years ago on the Athenian Acropolis, is actually in somewhat low relief on the back wall of the pediment. The frieze of the cella of the Parthenon, save the papyrus, at the western end, was evidently carved *in situ*, before the stone roof of the peristyle was put on, and worked upon the very stones of the wall. Not only this, the relief of which is, of course, very low, but also the metopes and the pediments, which, as we have just seen, are essentially reliefs and not groups in the round, represent a

diversifying of an otherwise plain surface of stonework with light and shade. The representative character of the ornament, the subject of the reliefs, is a secondary matter. The fact that these ornamented portions of buildings like the Parthenon have been abstracted from the fabric and set up in museums as specimens of representative sculpture obscures their true character. At Palermo the Selinus metopes are properly placed in the museum, set between the actual triglyphs and under the actual cornice of the temple, so that their decorative character is emphasised. The same plan is adopted in the British Museum in the case of some smaller monuments, but the Parthenon sculpture is not tectonically shown.

The architectural monument represents, of course, the most important application of tectonic principles, but these same principles apply equally to furniture, to vessels and utensils, and, indeed, to everything which is made up of parts. There is always in regard to these objects a suitable or an unsuitable general shape; a right and a wrong way of putting the parts together; an opportunity for making the structure look clear and firm and serviceable, or mixing the whole thing up in a meaningless tangle. There is always a fit place and an unfit place for the display of ornament, and a correct and a mistaken character for the ornament to take. Moreover, the decorative painter and carver, the designer of coins, medals and postage stamps, the embellisher of books, and, indeed, the decorative artist in every branch of his work would find the advantage of a thorough grounding in the principles here called by the convenient term "tectonic." A course in tectonics should form, I venture to think, a fundamental part of every scheme of artistic education, whether for architecture, for sculpture or for the various decorative and industrial arts. A student who has obtained a grip of these basic principles would gain enormously in directness of vision with regard to his general aims in his work, and would be saved from many tentative experiments and from not a few blunders.

The best work of the Greeks from this point of view is to be found in their stone buildings and their gold jewellery. The painted vase, which is often regarded as one of the most characteristic Hellenic products, is in some of its aspects the exception that proves the rule. In its general shape in relation to its use, in its structure and the fitting together of its parts, as well as in the surface texture and quality of the glaze, it is one of the best products of the kind in existence, and in these aspects cannot be too often studied. In beauty of simple lines the contours of Greek vases of the fine periods are unrivalled, and the proportions and finish of foot and lip and handles are a model to all craftsmen. In two respects, however, these famous vases invite criticism. They are not frankly ceramic. Fashioned as they are of clay, they are far too often found trying to masquerade as metal. The influence of the bronze vase oftentimes on the clay one was very great, and was destructive of the originally ceramic character of the latter. In certain curious features of the decoration, in the treatment of the black glaze, and, above all, in the thinness of the fabric and occasional wiriness of the handles, there is betrayed a distinct effort to imitate the nobler and costlier material. Again, the choice of the style of decoration is not a fortunate one. The vase painting, representing always some figure scene for the most part of mythological import, though interesting in itself, is not a suitable form of decoration for the rounded body of a vase. A surface that recedes from the eye in every direction is not fit for the delineation of the human figure, as the parts of this are necessarily put out of due relation, and some disappear altogether over the horizon. As a ceramic product—that is, a glazed fabric of opaque clay—the Greek vase, though perhaps better as a whole than the over-praised Italian majolica, is much inferior to many coarser, more freely treated products, such as Hispano-Moresque or Persian lustre ware, in which the genius of the materials is the predominant factor, and substance, shape, colour, ornamental motives, texture, are all conditioned thereby.

Greek goldwork, on the other hand, is unrivalled for its simplicity and purity of style. It stands exactly at the opposite pole to the fashionable jewellery of modern times. In the latter the precious stone is all in all, and the setting of so little artistic account in itself that it is changed at will to meet the vagaries of fashion. In the Hellenic work the precious stone is non-existent, any touch of colour desired being added by enamel pastes, and the artistic handling of the single material of ductile gold gives all its value to the product. Not only is the workmanship, as Castellani testifies, unapproachable by the modern craftsman, but the chasteness of the forms and the elegance and distinction of the ornament are beyond all praise.

The Greek coin is not a tectonic product, in that it is not put together of separate parts. As a model for style and treatment it is, however, in its own way supreme. Greek coins in their artistic aspects have never been sufficiently exploited as educational media. Whether as originals or in electrotype reproductions, they are too small to be seen properly by more than one or two persons at once. Furthermore, there is so much archaeological lore connected with them constituting an

abstract science of numismatics, that their purely artistic interest has been a little lost sight of. Some means of reproduction are needed that should exhibit the design enlarged in scale to at least 3 inches in diameter. A couple of hundred selected Greek coins exhibited in this scale would be found to furnish an almost inexhaustible series of artistic lessons in composition, in treatment of relief, in distribution of details, and in conventionalising of natural forms to suit the exigencies of space. The inventiveness of the Greek designer in his variations on some established type is inexhaustible. A single type like the horse on Corinthian coins, the figure riding on the dolphin on those of Tarentum, the female head on the obverse, the four-horse chariot on the reverse, of the pieces of Syracuse—all appear in scores or even hundreds of examples, no two of which are the same. The dies of Greek coins were continually being renewed, and it is the rarest thing to find among existing specimens of coins any two that have been struck from the same die. Every time a die was cut, the type, though remaining essentially the same, was varied in composition and details, and each modification seems happier than the last. The modern designer should regard these exquisite specimens of his art, not as archaeological curiosities, but as fresh and spirited creations animated by just the same qualities that he would himself wish to secure in his work, and, regarding them in this way, he will find in them not only technical guidance but also inspiration in the higher operations of design. For it is not only in composition and treatment that the Hellenic mint-master is so successful. He is just as distinguished for the felicity with which he conceives his expressive and suitable designs. The Greek coin differs from the painted vase and the engraved gem, forms of Hellenic art with which it may naturally be compared, in that it remained throughout a thing of use and never passed like vases and gems into the cabinet of the collector. Even in the antique world the vase and the gem had degenerated into the "objet d'art," the coin escaped this fate, and remained to the end an instrument of commerce bound up with the utilitarian needs of the community. Hence the device which marked the coin was never, like the device on engraved gem, merely fanciful; it was always of serious purport and expressed some historical, commercial or religious idea intimately associated with the State which issued it. The Greek designer was the master of an artistic shorthand by which he concentrated a world of significance into a single pregnant device. If we seek for a phrase in which to describe his operations, we may say that he excelled in "the artistic wording of an idea in terms of form," and the study of his work from this point of view could not fail to be helpful to the designer of to-day. It need hardly be said that the work of our own outstanding artists in design is characterised as much by felicity in conception as by taste and skill in the carrying out. It is not work of this higher order which is here contemplated, but rather the mass of everyday design that is not the best we can accomplish, but is turned out in great abundance to supply the incessant demands of the market. In conception the motives of this decoration are often terribly bald and plain-spoken—wholly wanting in that poetic allusiveness that characterises Greek and Mediæval design. The motives displayed on the ordinary modern trophy or casket to contain the illuminated address or burgess-ticket are depressingly prosaic and literal, and there is room here for some lessons in artistic shorthand, which a study of Greek numismatics would afford.

Time will not allow of any further illustrations from the varied and interesting artistic work of the Greeks, and what follows must take the character of a few words of summary. An ancient writer has preserved a record which touches with pathetic interest the later history of that Greek colony of Paestum or Poseidonia, where stands the great temple at which we have already glanced. It was in Central Italy and was an outlying representative of Hellenic civilisation, so that as time went on the native Lucanians of the surrounding territory pressed in upon it, and almost submerged in barbarism its once pure Hellenic culture. It is said that the representatives of the original colonising stock used still to gather together once a year at the festival of their patron deity; in solemn assembly they would pour the wine once more upon the unheeded altar, and with sighs and tears would profess one to the other that they were still Greeks.

We have not to lament that we were once Greeks and are in danger of being Greeks no longer, but are in the happier position that we can claim as our own the heritage of Hellenism in virtue of that free cosmopolitanism which permits us to choose from all the past such lessons and examples as we need.

And we need to take over from the Greeks that obligation to absolute thoroughness and certainty in all we do which, as artists, they so well recognised and fulfilled. Nothing we owe to the Greeks is of greater value than the very high standard they set both in artistic thought and in artistic execution. Whatever the Greek artist touched he gave to it beauty and significance, and there resulted what the Germans call a

"Beseelung"—a "giving of a soul" to all constructive form. These possess in consequence a distinction, a look of purpose and efficiency, that have secured for them a sort of artistic immortality. They are still with us, and will probably remain a possession of the human race to the end of time. Whether we actually continue to use these forms or not, they are abiding standards of form and finish the virtue of which standards will only increase with time. The tendency of modern days to haste and incompleteness of work will grow greater as the general hurry and strain of life increase, and repose and perfection of Greek work will become more and more precious in contrast.

On the actual use in modern work of these classical forms word may be said in conclusion.

It is not the business of the architect of to-day to ere Greek temples like the Madeleine at Paris, or, as at London and Edinburgh, to force the forms of the Erechtheum into the service of modern requirements. Our architectural classicism of the early part of the last century went too far in the attempt to transplant into the surroundings of modern life in North-western Europe the special forms of plan and elevation that suited the social and religious purposes and the climate of the Greeks. In Scotland much of the work of Hamilton and Playfair, such as the High School at Edinburgh or the Royal Institution that faces Princes Street at the bottom of the Mound, are too artificial in their classicism to suit the taste of the present day, which, after the battle of the styles, has settled down, as we have seen already, to a moderate and common-sense view of things.

Perhaps in our own country St. George's Hall at Liverpool goes as far in the resuscitation of the antique as modern taste will allow. It is a monumental structure designed for a state outward effect, and for actual uses fully in accord with the spirit of Attic culture. Hence the style has a natural suitability to the purpose of the building, while it is treated in so free and original a fashion that we have no sense that art is in bondage in it to archaeology. A more limited employment of classical forms for domestic as well as for monumental purposes we find in the neo-Classic town architecture of eighty or a hundred years ago, of which the work of Robert Adam, in Edinburgh and London, is a central example. The scheme of the buildings in question is not Classic, for the chief element of their architectural effect is the wall pierced with window openings, and this is not a form used in the antique world; but the details are largely drawn from the "repertory of ready-made details" referred to at the beginning of this paper. The question has been already posed, whether the continued use of these is only a matter of unreasoning habit or has for its justification some solid artistic grounds. Enough has been said already about the merit of these features in themselves, perfected by the form-giving genius of the Greeks. The objection to their continued use is based on the fact that though admirably fitted for their original purpose and surroundings, they are trite and conventional forms meaningless to the modern intelligence.

May it not be argued, however, that this very familiarity and conventional character of the forms in question is an architectural advantage? If the effects of architecture depend so largely on composition—that is, on the relations of proportion among the parts—the less attention the parts attract to themselves the better. The original features which the new art movement has introduced into notice challenge attention by their novelty and sometimes by their strangeness, and even by their uncouth aspect. Attention is in consequence distracted from the general effect, which depends on the harmony of relations, and is directed to the parts rather than to the whole. If these forms were good in themselves we might be content to wait till we became familiar with them, and they dropped by consequence into the background. As a fact, however, the creation of satisfactory tectonic forms is a very much more difficult matter than some people imagine, and a repertory of features that are to take the place of the forms matured by the Greek masters of old is not the work of a single day or generation.

Professor BERESFORD PITE, who proposed a vote of thanks to the author, said the paper had displayed a field of thought that few had time to explore, though they were all more or less acquainted with the subject. There was a great deal of matter in the paper which afforded ample ground for discussion, as seemed to bristle with questions, but probably the debating points raised would not add much in answer to the initial question—the real value of Greek work to the modern artist. The paper did not truly estimate, the speaker with diffidence ventured to suggest, the action of time upon Greek buildings. Their ruins seemed to be in every case pathetic and to seriously detract from artistic value. The greatest charm of Greek work was its finish. Practically, they could not get much real good from the study of monumental Greek architecture unless they had some monumental work to design, when the primary elements of impressiveness, the careful and experienced adjustments which the Greeks arrived at, would be of the greatest possible value.

Greek view was a narrow one. Its scope seemed limited to the column and the entablature, and in this there was little practical use to modern architects. Apart from monumental art there was very little that could be of use to them. The suggested application of tectonics to the Panathenaic frieze was difficult. The frieze was a representation of the narrow view the Greeks took; its motive would have been happier. Mediaeval architecture had been dubbed romantic, but it had altogether more value than Greek architecture could be by tectonics. There was less room for romance in a Gothic church than there was in a Greek temple, and this was to be amply seen in the French cathedrals of the thirteenth century. Gothic was necessarily sound construction coupled with the artistic expression of that spontaneity which was the secret of the mystery of nave and chancel. It was the art that held the secret of the beauty of the Gothic cathedral, the engineering skill that was the real charm of the Gothic art, and these were tectonics.

Mr. H. H. STATHAM, in seconding the vote of thanks, said he thought they would never be able to get away from the fact that they must do without them. It seemed to him that they must regard as the highest expression of ideas in artistic form, though the creation of man yet they were the most perfect expression the world had known, and until they did invent a better style than the Classic, the orders must remain as a practical part of architecture. They must not despise them, but the speaker thought architecture could not be without their influence.

Mr. ALEXANDER WOOD said he wished to advance the suggestion that if Greek art was limited in its scope, that was the direct purpose of the Greeks. Their art was selective, they were acquainted with other styles and methods, but they did not introduce them into their work. It was not want of knowledge which narrowed their view, but the aim of limitation was the perfection of their art.

ACETYLENE.*

BEFORE I begin this paper on acetylene I think it right to state that I am indebted very much to the Cantor Lectures on this subject, given by Professor Vivian Lewes, and the report of the Third Congress on Acetylene, held at Paris in 1900.

I propose to confine my remarks to the history and chemical composition of the very curious product of the electric furnace to which the name of carbide of calcium is given, and from which the gas acetylene is generated by the action of water.

Long ago as 1836 Edmund Davy, in Dublin, who was Professor of Chemistry to the Royal Dublin Society, discovered acetylene gas and demonstrated some of its more remarkable properties. He read a paper at the British Association the same year, and showed that when the metal potassium was heated a mixture of calcined tartar and charcoal in a large iron bottle a black substance was formed which was easily decomposed by water, and yielded a gas then called "burette gas"; subsequently, as we now know, it was named acetylene. In this paper Professor Davy pointed out the brilliancy with which this new gas burnt, and it was admirably adapted for artificial light purposes if it could be produced at a sufficiently cheap rate.

Twenty years later, in 1857, Züst and Boettiger made some experiments, but it was not until 1859-62 that Berthelot made out its true composition and method of formation.

He showed that acetylene was formed during the decomposition of many organic substances by heat, and that ethylene, benzene, alcohol and ether all yielded this gas when passed through heated tubes, and finally demonstrated the possibility of synthesising acetylene by passing the electric current through carbon points in an atmosphere of hydrogen.

Further development has been suggested, as Professor Berthelot states, which is interesting, viz. that alcohol and proboscis might be made from acetylene.

Acetylene was first called bicarburetted of hydrogen, afterwards "carburetted," but later acetylene has been adopted.

In analysis the gas is found to contain:—

Carbon	92.3	} Which answers to the formula C_2H_2 .
Hydrogen	7.7	

It has a density of 0.92. Water = 1.

The action of water on calcic carbide it has a strong and pungent odour, but when purified from sulphuretted and carburetted hydrogen has a somewhat ethereal smell which is unpleasant.

It is easily soluble in water which at ordinary temperatures

was read before the Society of Architects by Mr. John W. L. M.A., and Mr. F. Windham, A.M. Inst.C.E., on February 19.

and pressures takes up a little more than its volume of gas. According to Professor Lewes:—

Brine dissolves	0.05
Water	1.10
Alcohol	6.00
Paraffin	1.50
Acetone	31.0

It was thought that it would not be possible to use acetylene in ordinary gas-fittings as it forms compounds which explode with copper, but subsequent experiments have shown that except with pure copper and under circumstances which cannot occur in ordinary working, the gas-fittings, if of the best material and workmanship, may safely be used.

When mixed with air it is very explosive, and detonates under certain conditions with such violence that it cannot alone be used for gas-engines.

For further information I would beg to refer anyone who is interested in this question to the admirable Cantor Lectures I have above mentioned, which cover far more ground than can be attempted on the present occasion.

Carbide of Calcium.

It is well understood that for commercial purposes acetylene is best generated from carbide of calcium, though there are other carbides of the metals which give off gases more or less consisting of acetylene when decomposed by water.

The history of the manufacture of this substance is detailed at length both in Professor Lewes's lecture and in the Comptes Rendus of the Congress of Acetylene, to which I have referred.

It was first made for commercial purposes at Spray, in North Carolina, by Mr. Wilson, and soon after at Leeds and at the great works at Foyers; also many installations in Europe, in France, in the Pyrenees and the Rhone Valley in Germany, at Neuhausen, near Schaffhausen-on-the-Rhine, and in other places where water power is to be obtained.

The two processes used in making calcic carbide by electric power are the ingot and the tapping process.

In the ingot process the coke and lime, both of which must be very pure and especially free from sulphur and phosphorus, are carefully mixed and ground finely. The arc is struck in the crucible, and the powder is allowed to flow in and partially fill the crucible. An ingot is gradually built up from the bottom of the crucible, the carbon electrode being raised from time to time. The crucible is of metal. The essence of this method is that the coke and lime are only heated to the point of combination, and are not "boiled" after being formed.

In the tapping process a fixed crucible is used, lined with carbon. The electrode is nearly as big as the crucible, and a much higher current density is required. The materials do not require to be ground fine. The carbide is heated to fusion and is tapped at short intervals.

Calcic carbide, as formed in the electric furnace, is a crystalline semi-metallic looking substance, having a density of 2.2. It can be kept unaltered in dry air, but the smallest trace of moisture in the air leads to the evolution of acetylene and gives a distinct odour.

The purity of the carbide entirely depends on the purity of the materials used in its manufacture. Although great care is exercised, minute traces of sulphuretted and phosphoretted hydrogen are found. The first gives rise to a pungent odour, and the other compound would, if present in any large quantity, cause the gas to ignite when coming into the air.

There are also some other impurities in the carbide. Professor Lewes notices very small diamonds as having been observed, while portions of the crust seem to consist of a very hard combination of carbon, silicon and aluminium, commonly called carborundum, which is used in America as a substitute for emery powder, and for grinding wheels, &c.

Acetylene is used to enrich the oil gas used by the railway companies, and Professor Lewes states that fully 3,000 tons of carbide were so used in Prussia in one year by the railways. It has also been found to be useful in enriching a slightly modified form of water gas.

These mixtures are stated to be free from any danger when compressed for railway use, and will no doubt be largely used in the future.

In conclusion I would wish to quote the words of Professor Lewes, that "forty lectures would not be too many to illustrate this subject, and that in time cheapened carbide will enable this valuable hydrocarbon to take its place in the foremost ranks of our illuminants." JOHN W. WOODALL.

System of Generators.

The various systems, all of which work slightly above atmospheric pressure, 3 to 4 inches of water being about the best pressure to keep the burners free (though the Home Office regulations allow 100 inches of water pressure), may be divided into three classes:—

1. Those in which the calcium carbide and water are brought into intimate contact by a change of level of one or the other substances.

2. Those in which the water is allowed to fall or come in contact with the carbide drop by drop.

3. Those in which the water volume largely exceeds the volume of carbide which is allowed to fall into the water.

Class 1.—The machines under class 1 are so-called automatic, but they are mostly unsafe from the fact that high temperatures may be reached by the carbide, which causes disintegration of the resultant gas, producing benzene, ethylene and various other tarry deposits which tend to foul the pipes and apparatus. It is possible in such an apparatus, if the gas is in contact with air and the carbide is not properly cooled, to set fire to the gas.

Again, the lime absorbs water during the time it is hot and gives it out on cooling, so that the generation of gas goes on though nominally arrested. There have been accidents with this class of machines.

Class 2 are mostly machines combining a rising bell and a carbide-charging apparatus; these are largely in use and act fairly well, provided ample means are taken to keep the carbide cool during generation. They are controlled by a rising bell, which automatically shuts or opens the water supply by its rise or descent. They may be subject to undue heat under the following conditions:—

Supposing the generator is fitted to contain a fixed charge of carbide intended to work at a certain rate per hour (*i.e.* to light so many burners of a certain power), and the users, which is often the case, either use more or larger burners, the generation of the gas then goes on much quicker than the prescribed limit; the apparatus, suppose, is suddenly put out of use, the water supply is automatically shut off, and the carbide feeds on the small amount of water left. Hence three results may occur—either that a dangerous heat is set up, that the carbide may swell and prevent the little water present from getting to it, or that a disintegration of the acetylene takes place and foreign gases and tarry products result.

Class 3. These are undoubtedly the safest forms, provided that carbide is not in a powdered form, but is in fairly large lumps, and is fed in through an air and vapour-proof hopper.

Hitherto it has been the custom in automatic machines of this class to feed with powdered carbide, released or actuated in some way by a hopper, controlled by the action of a bell. But seeing that vapour to some extent is always produced by the falling of the powdered carbide into water, the tendency has been to form a conglomerate mass at the mouth of the hopper, consisting of pasty carbide, which prevents the free action of the apparatus. If, however, the carbide is fed in larger lumps, and through a vapour-proof hopper, the chances of success will be almost assured. Such a machine is now on trial and promises good results.

Comparative Cost.

The price of acetylene gas will always be governed by the price of carbide, assuming that 1 lb. of carbide will give off 5 cubic feet of gas which, when burnt in suitable generators at a low temperature, should give 240 candle-power, but, as a matter of practice, 220 candle-power should be a fair assumption.

Carbide fluctuates in price owing to "corners" made by the manufacturers, restrictions put on the carriage of it (except in bulk).

It may be taken including delivery, cost of non-returnable drums, &c., at about 3*d.* per lb. in quantities of 1 cwt. and thereabouts.

Some allowance must be made for the purifying material also.

Taking coal gas at 2*s.* 6*d.* per 1,000 to cost 1*d.* per 33 feet, then 33 feet should, under very favourable circumstances in the ordinary burners, give 70 candle-power, say 1½*d.* per 100 candle-power per hour.

One hundred and ten candle-power per hour with acetylene at 3*d.* per lb., 1½*d.* per hour.

In districts, and there are many of them in country places where coal gas is 6*s.* 8*d.* and 7*s.* 8*d.* per 1,000, acetylene will come well to the fore.

Installation.

The installation is simple; the pipes need be about quarter the area of those for ordinary gas, and there is less heat given into the rooms, as only about one-tenth part of the gas by volume gives off equal light to coal gas; the heat given off by a flame of equal intensity is about 1,000 C. for acetylene against 1,360 C. for coal gas.

Taking a room to be well lit up with 70 candle-power, ordinary gas in bat-wing burners would give off 20 cubic feet of carbon dioxide in addition to about 60 cubic feet of water vapour, and would remove about 26 cubic feet of oxygen.

With acetylene the produce is only	4 cubic feet CO ₂
	2 " Water vapour,
	5 " Oxygen.

The pipes and fittings used should not be of copper, copper and silver having properties of forming acetylides of the metal when in contact with the gas and water. Iron and compo suit well, and the mountings of a good brass alloy with an admixture of tin. The cocks should be well ground in and the joints

of the system throughout made with a spirituous mixture as red lead and gold size, shellac and spirit; ordinary red and oil is not suitable unless given a very long time to set. As the pressure being much more than double and sometimes four times that of ordinary coal gas, the weak parts soon discovered by the gas, and unset joints made with putty may be blown through before they have time to set.

The whole system should be well tested and allowed to stand with the pressure on double of that at which intended to work for some hours; ordinary gas-fitters are too careless, and qualified people should be engaged to fit up in every case, otherwise the apparatus may be blown

Purification.

Good results will be obtained by purification. Users make a simple form of mixture with lime and coke sprinkled lightly over trays. The coke may be previously steeped in chloride of lime or hydrochloric acid, and a spoonful of this mixture to a bucket of water put into the tank acts as a good purifier.

In winter it is well to have the bell working in a solution of salt (preferably chloride of calcium), as this mixture will not freeze in this climate under covered places where generators are likely to be kept; and again it is well to keep this mixture for everyday work, as much less gas is absorbed by the saline water, ordinary water being able to take up only one-tenth of its own volume, whereas a brine solution will only absorb one-fifth of its volume.

Portable Apparatus.

So far no mention has been made to portable apparatus which must assume large proportions in the colonies and climates where paraffin and coal gas are difficult to procure and convey. Carbide in wet or dry climates, if treated by a special preparation, can be made to resist the action of moisture for long periods, and some samples are produced here to-night. It may be divided into three sections:—

1. By which the carbide is coated with a glucose mixture which absorbs the lime when mixed with a preponderant amount of water.

2. Carbide intimately mixed in the plastic state with hydro-carbons.

3. Carbide coated with an elastic varnish, coupled with hydro-carbon capable of absorbing some of the impurities resulting in the generation of the gas, and capable of intercepting the flame.

No. 1. Taking No. 1, the proportion containing glucose which itself contains a certain proportion of water naturally absorbs some of the lighting qualities of the gas, and adds a considerable weight to the compound. The glucose covering is readily attacked by moisture in the air and has to be kept well secured air-tight cases.

No. 2 This mixture is not so subject to action by moisture as the heavy oils are incorporated in the mass, but weighs more; the amount of active carbide is far less as compared with the same weight of good active carbide, and consequently the gas production per lb. of material may be reduced to 25 per cent.

No. 3 is a process which treats the carbide without decreasing its efficiency in any way, either by contamination with nascent vapour or by dilution with extraneous oil. It amounts to a flexible film applied to the carbide under a temperature exceeding 212 deg. Fahr., at which no water is present; it adds very little to the weight, about 2 per cent. an amount that is practically not worth considering, so that raw carbide may lose as much as 10 per cent. to 15 per cent. of its gas efficiency if granulated or exposed during the ordinary process of turning off into small charges.

It will give off the full gas efficiency due to the carbide; it leaves the factory fresh from the furnace, the ingredients in the film helping to reduce the endothermic action of the generating process, thereby giving a purer gas, and at the same time absorbing many of the heavier vapours which tend to clog the burners.

The cost of this compound by weight therefore gives the best value for money.

I have alluded to prepared carbide only in connection with portable apparatus, the reason being that in small apparatus of this kind there is not gas room sufficient for the development due to raw carbide, hence some form of carbide is generally used treated in some way with a restraining medium.

Again, seeing that portable apparatus are far more exposed to exposure, it is almost necessary to have some means of protecting the charge.

F. WINDHAM, A.M.INST.C.

The Skipton Borough Council have instructed Mr. Butler Wilson & Oglesby, architects, of 12 East Parade, to prepare designs for the enlargement of the town hall, Council offices, Skipton, Yorks. The scheme comprises extensions to the hall, with a new supper-room, the entire modelling of the Council offices and the provision of new house for the magistrates.

EXPLORATION IN CRETE.

In a letter to the *Times*, Mr. George A. Macmillan refers to his appeal for further help in carrying on the work of the Cretan Exploration Fund:—I said that we wanted at least 500*l.* to complete the excavation of the palace at Knossos and to carry on other work at Palaiookastro, in which the Cretanagers of the fund are pledged to assist. I added that if we could raise another 1,500*l.* we could so far recoup Mr. Evans for the large personal outlay which, with a disinterested zeal which has perhaps carried him beyond the limits of prudence, he has incurred in connection with his wonderful discoveries. We have received up to now about 1,000*l.*, of which between 500*l.* and 600*l.* has come in since the publication of my letter. Towards this amount the Hellenic Society and Mr. Walter Morrison contributed 100*l.* each; the Cretan committee of the British Association and the Society of Aquarists 50*l.* each; while the rest is made up of smaller contributions, from 25*l.* to half a guinea. As many of your readers are aware, a room has been devoted at the winter exhibition of the Royal Academy to the display of drawings, casts and photographs illustrating the principal discoveries made by Mr. Evans and his fellow-workers. Special attention is given to his exhibit on the cover of the catalogue, and from what I have seen and heard it seems clear that no room in the Burlington House has drawn a more constant or more interested concourse of visitors. In the first instance Mr. Evans only arranged to lend his drawings and photographs for the month of January, but he has been urged, and has consented, to allow them to remain there until the exhibition is closed. It is no wonder that so much interest has been aroused, and no one can see what is there displayed without realising that a marvellous contribution Mr. Evans has made to our knowledge of ancient art and of the whole history of civilisation. The wonder is that when, on the strength of such results already achieved, so comparatively small a sum as 500*l.* is asked for to complete the work it should not be immediately forthcoming. It was suggested to me the other day that a procession of "unemployed Cretan excavators" parading Piccadilly with collecting-boxes might produce the money required, but I prefer to believe that once the necessity is known the remaining 700*l.* will be easily raised without resorting to such methods. Mr. Evans is now in Crete again this week, and it is likely enough that in the course of March news will come of further discoveries. I trust that his strenuous labours will be encouraged by the news that he need not be anxious about funds, but may be free to complete one of the most fruitful excavations of modern times without further encroachment upon his own resources, which have already been drawn upon too freely. I only add that subscriptions may be paid to the account of the Cretan Exploration Fund at Messrs. Roberts, Lubbock & Co., Lombard Street, or may be sent to myself at St. Martin's Lane, London, W.C.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual dinner of this Society (allied with the Royal Institute of British Architects) was held on the 12th inst. at the Queen's Hotel, Leeds. The president of the Society (Mr. Butler Wilson) occupied the chair. Mr. Bodington, in giving the toast of "The Royal Institute of British Architects," said the problem had been propounded whether architecture was a profession or an art. He replied that it was both, or at all events that the element of art was not neglected. Of all the arts surely architecture was the most universal and the most national—the most universal, because though music might disappear and painting might pass away, so long as men required houses to live in and buildings for public purposes, architecture must flourish. More-over, of all the arts architecture most accurately expressed public sentiment, and most expressed the ideals of the national spirit of the day. If the literature of Greece, of the Middle Ages, of Egypt or of India had totally disappeared, they could have learned much of the national characteristics and national ideas of these periods from the architectural monuments which they had left. When national life was simple and architecture was simple. To-day we lived in an age of complex ideals—we scarcely knew whether we were Hebraic or Greek in our sympathies. We tried to combine the devotion of the Middle Ages with the scepticism of the Renaissance, and the result was that our architecture, while it was learned, it was careful, while it was often inspired by genius, it was the incoherence and want of simplicity of the national spirit. Under these circumstances it was of particular interest and importance that there should be architects in England, and that whom architecture would tend to become merely whim and merely a matter of individual taste. To an institution which sort the whole profession of architecture, and more than the whole public owed a great debt of gratitude.

Mr. John Belcher, A.R.A., replying to the toast, said that the Institute might be said to be the representative body of British architects throughout the Empire. The more thoroughly architects co-operated with the Institute in maintaining the status and integrity of the profession the more effectually would its status be safeguarded and the beloved art advanced. There were, he continued, other things which conducted to health besides a proper system of drainage, and he thought the authorities should not only take precautions against contamination through the senses of smell, taste and feeling, but they should also be careful that nothing should be received through the eye or ear which was corrupt, coarse or vicious. That which was repulsive must affect the mind, and the mind reflected upon the body. "Leeds," continued Mr. Belcher, "possesses many admirable buildings which may be said to be healthy in all respects, but I am sorry to say that, like other cities, there are a great many buildings that cannot be so described. I cannot say that I would suggest that this question of aspect and design of buildings should be considered by the Sanitary Department, but it is very important from the point of view of health, and there is much to be said in favour of a Minister of Fine Art, under whom some general supervision might be wisely exercised over all that is to be presented to the public eye. In the meantime we must, as architects, remember our responsibilities. We must protect and lead the public taste, and we must resist as strongly as possible such insidious, enervating and unwholesome forces as are affected by what are known abroad as "les nouveaux," and we must endeavour to encourage pure, simple and manly methods which belong to a healthy British tradition."

Mr. Fred Kinder, in proposing "The Houses of Parliament," said that, in his capacity as a member of the parliamentary committee of the City Council, he had had occasion to listen to the conduct of the nation's affairs in the House of Lords, and he had been struck by the fact that they, at any rate, lived up to the Scriptural injunction that "the earth is the Lord's and the fulness thereof." As a business man, he had never been able to discover that they were of any particular use to him. When he visited the House of Commons he listened to gentlemen on both sides snarling very politely at each other. He had honestly and sincerely come to the conclusion that the man who remained at home, and spent his time attending to a street lamp being put up where it was needed, a drain being properly carried out, a hospital being built, or even Victoria Square being beautified, was doing far more good to his fellow-men than those who comprised the talking machines at Westminster. He supposed, however, that there must be some good in those institutions, but, though he proposed the toast, he frankly said that, constituted as they were at present, he saw very little good in them.

Mr. Rowland Barran, M.P., responded to the toast. He said that perhaps the members of the Society would take a more candid and critical view of the utility of the Houses of Parliament than had been taken by Mr. Kinder. Turning from that aspect of the subject, both the direct and indirect influence of Parliament on architecture was very great, and whilst there were many architectural achievements of which past Governments might with justice be proud, there were some buildings put up by our Governments which architects preferred to pass by in silence. At the present time there were many great works going on in London in the neighbourhood of Whitehall, and thanks were due to recent administrations which had made such wonderful clearances and which inspired great hopes as to the class of building to be erected there. Mr. Barran said that he was a careful and interested observer of architecture, from some of the most ancient examples in the East to the sky-scrapers in America, and no subject gave him greater pleasure. Many of Mr. Belcher's colleagues of the Royal Academy must envy the position of a man who worked in the methods and with the substances that architects dealt with. Water-colour painters knew that in 150 years at the outside their colours would begin to fade. Those who dealt with the more durable pigments of oil realised that within a limited number of centuries, at any rate, their works must to some extent fade also. But there was in architecture an art and a science which lasted almost as long as the solid fabric of the earth itself. There were to-day buildings which dated back beyond all written history. In that there seemed to be room for a natural envy. He did not mean it to be supposed by that that a building put up, say, in Leeds, under the building by-laws, and complying with all their specifications, was likely to last till eternity. God forbid that many of them should do anything of the kind. Architects, looking around Leeds, would be inclined to say that the city had buildings of great utility, great size, erected possibly at great expense, useful and suitable buildings, but buildings that were not architecture. The Government had one advantage over commercial towns in the provinces, in being able to centralise large suites of public buildings and offices, which gave the architect an opportunity of erecting something which

was in the highest sense architecture, which some of the buildings which had to be erected in industrial centres certainly were not. Architects felt somewhat keenly those limitations. "In a city like Leeds," Mr. Barran continued, "questions of utility must take the first place, and it is therefore a very difficult thing for an architect to erect any building which can correctly be described as belonging to a high class of architecture, or to claim any amount of beauty. We have in Leeds, however, a growing number of buildings which have some claim to art. I often think that in these smoke-begrimed cities, if we could pay rather less attention to the ornamentation of our buildings and more attention to the proportions, we should achieve more architectural success than we do at the present time." In conclusion Mr. Barran spoke of the influence of the Houses of Parliament upon architecture, and said that he hoped, whatever party might in the future be in power, the Government would keep in view that we required not only a successful and prosperous nation, but that we need a cultivated nation.

The Mayor of Harrogate gave the toast of the Society, and remarked that it was one of the oldest provincial societies in existence, having been founded in 1877. He was pleased to see they were also a prosperous body, as during the past year their income exceeded their expenditure by 96%, while their membership had increased from 118 in 1901 to 124 in 1902, and 137 in the present year.

The President of the Society, in responding, said the area covered by the Society extended from Teesdale in the north to Huddersfield in the south, from a considerable distance in the west to Flamborough in the east. They had instituted a system of education for the associates of their Society, and they had ventured to name it a school of architecture. Although at present it might exist only in name, they hoped in the near future to make it a reality. They hoped to make Leeds prominent as the Metropolis of the North so far as architecture was concerned. He regretted that the old universities, such as Oxford, which owed so much to architecture, offered no rewards to the architectural student, but he hoped the time was not far distant when a degree of architecture would be offered by these ancient seats of learning. In the meantime, it had been left to the newer universities, such as the Victoria University, to take the first step, and he hoped before long that at the Yorkshire College they would have a chair of architecture.

Mr. F. G. Bowman submitted "Our Guests," and Mr. W. J. Locke (secretary of the Royal Institute of British Architects), in responding, said that, speaking unofficially, Mr. Frampton's scheme for the rearrangement of Victoria Square seemed broad and delightful, and all he could say was that when one had an artist so sensitive and yet so broad as Mr. Frampton, it was as well to leave oneself absolutely in his hands and rely upon the dictates of his genius.

The toast was also acknowledged by Mr. J. E. Bedford, chairman of the Leeds school of art committee.

HISTORIC SOCIETY OF LANCASHIRE AND CHESHIRE.

THE third sessional meeting of this Society took place on the 12th inst., Mr. W. H. Lever presiding, to hear Mr. W. Fergusson Irvine read a paper on the old historic house near Bolton, "Hall i' th' Wood." Mr. Irvine sketched the history of the house known as the "Hall i' th' Wood" from its earliest known date at the end of the fifteenth century down to the present time. He pointed out how the part that is now the east side of the house was probably the original portion built by the Brownlow family about the year 1480, and how Lawrence Brownlow, in 1591, added the north-west wing in stone, thus departing from the tradition of his ancestors, who had built in the well-known black and white style with timber and plasterwork. The next addition, Mr. Irvine pointed out, had been made in the year 1648 by Alex. Morris, a famous parliamentary leader, from whom it passed by descent to the family of Starkie of Huntroyde, in whose possession it remained until the year 1899, when Mr. W. H. Lever bought it in a very dilapidated condition, and, having restored it in a very careful and discriminating way, presented it to the people of Bolton as a museum. The lecture was illustrated by numerous excellent lantern slides, showing the house from various points of view, and also illustrating some of the interesting Mediaeval furniture which Mr. Lever had purchased and presented, so that historical students could actually see what sort of rooms our ancestors occupied and used three or four hundred years ago. Mr. W. H. Lever, in proposing a vote of thanks to Mr. Irvine, spoke at some length, and paid a high tribute to his ability as an antiquarian. This was seconded by Mr. H. C. Gorst and heartily accorded.

The International Congress for the teaching of design will be held in the first week of August, 1904, at Berne.

GENERAL.

The King visited on Wednesday the model dwelling erected by the London County Council on a portion of the site of the Millbank Prison to accommodate tenants removed from their former residences under the Council's housing improvement schemes. The visit was of a semi-private character, but the King was received by the chairman of the Council, Sir William Collins, and the deputy-chairman of the Council, Sir William Collins, chairman of the housing committee, and other representatives. The King inspected some of the tenements.

The Prince and Princess of Wales will visit the site of the dedication of the nave of the cathedral, which is to be dedicated on July 15.

Mr. Richard Arthur Roberts has been appointed by the King to be secretary to the Royal Commission on Historical Manuscripts, in succession to the late Mr. Cartwright.

Messrs. W. & J. Faulkner have offered to present to the borough of Southwark an ornamental illuminated clock tower to be erected in St. George's Circus in place of the Obelisk standing in that position.

The Arrangements for the trial of the action which Treasury has instituted against the British Museum in order to decide the right of ownership in certain Celtic gold ornaments have been completed, and it is understood that the hearing will take place without delay.

The International Fire Prevention Congress will be opened on July 7 with a general meeting, followed by several meetings on July 8 and 9. The Congress office will be at 1 Waterloo Place, S.W., where particulars can be obtained from the hon. secretary.

The Bishop of London unveiled on Monday a mosaic in the principal hall of St. Paul's School, Hammersmith, which represents the Child-Christ enthroned, in the act of teaching the Temple, with figures of the Virgin Mary and St. Joseph on either side and doctors of law in the background. There is also a representation of the miraculous draught of fish. Below the mosaic, on either side of the organ, are figures of St. Paul and Dean Colet. The general scheme of decoration comprises figures of eminent men who have been connected with the school, such as Erasmus, Milton, Lord Campbell, William Lilly, the first high master. The mosaic is the work of Mr. T. R. Spence.

The London County Council have decided to acquire the freehold of a site on Brixton Hill under Part III. of the Housing of the Working Classes Act, 1890, at an estimated cost of 7,500%.

The Dean of St. Paul's has dedicated the memorial tablet to the late Lord Lytton, erected by subscription, in the choir of the cathedral. It consists of a bronze medallion enframed in green marble with an inscription. Mr. Alfred Gilbert, the sculptor, was the sculptor.

Cadets' Quarters are in course of erection at the Naval Academy, Annapolis, U.S., which will cost 3,000,000 dollars. The principal structure is 1,385 feet in length and 500 feet in width.

The Bridlington Town Council have decided to expend 30,000% on the construction of a sea-wall and promenade for visitors, and shelters to accommodate 3,000 people.

Mr. Henry Lovegrove will read a paper before the Institution of Surveyors on Monday next on "Regulations for the Protection from Fire."

The Duke of Argyll will preside at the annual meeting of the Coal Smoke Abatement Society, which will be held at Grosvenor House on Tuesday, the 24th. Among those who will address the meeting are Sir James Crichton Browne, Michael Foster, M.P., Sir W. B. Richmond, R.A., and Shirley Murphy, medical officer of health to the London County Council.

The Late Mr. H. H. Cronk, of the firm of Messrs. H. & E. Cronk, architects, of Tunbridge Wells, left a personalty of the value of 7,503%.

The Council of the Royal Society of Painter-Engravers have elected as Associates Mr. Hedley Fitts and Mr. J. Nordhagen.

The Grand Theatre at Luton, which stands on a former site and was constructed from the design of Messrs. C. S. & Son, has been sold for 11,500%.

At the meeting of the Northern Architectural Association which will be held on Wednesday next, the 25th, Mr. G. S. Aitken, F.S.A. Scot., of Edinburgh, will, in addition to Mr. R. P. S. Twizell, A.R.I.B.A., being unavoidably prevented from lecturing on this date, read a paper on "Architecture and the Age."

Messrs. Spurrell & Murray are the architects of a new Congregational church which is being erected at Worthing.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 15,000*l.* Premiums of 60*l.*, 25*l.* and 15*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

CASTLEFORD, YORKS.—March 31.—Designs are invited for a free library. Premiums 15*l.* and 10*l.* respectively. Mr. H. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

A NEW and entirely up-to-date theatre to seat 1,488 is about to be erected in the High Street, Colchester, to be known as the Grand, for Mr. H. Slocombe. Operations are to commence as soon as possible, as it is to be opened next Boxing Day. The plans have been approved by the Council. Mr. J. W. Start, F.S.I., of Colchester, is the architect.

AN effort is being made to restore Ickford parish church, near Oxford, in memory of Archbishop Sheldon, who was presented to the benefice by Charles I. in 1636, when he was already Warden of All Souls College. Ickford Church is a fine specimen of Early English work of the beginning of the thirteenth century, and has a tower with a saddle-back roof. The building is greatly in need of repair and restoration, which will cost 1,680l.

A BRIDGE, which it is said will have a central span of 840 ft, the longest for a railroad bridge in the world, is to be constructed by the Pennsylvania Company across Hell Gate, part of the East River which separates Manhattan Island from Long Island. Altogether there will be two miles of viadeway built of steel on stone piers. The centre span will be 135 feet above high-water mark. It is estimated that over 10,000 tons of steel will be used in the construction, at a cost of \$3,250,000. The contract has been placed with the United States Steel Corporation, and \$10,000,000 is set aside as the total cost of the bridge.

INTERNATIONAL FIRE PREVENTION CONGRESS, JULY 1903.

THE invitations to the International Fire Prevention Congress—issued by the British Fire Prevention Committee—having been largely and favourably responded to, it has been decided to open the Congress on July 7 with a general meeting, followed by sectional meetings on July 8 and 9. Several of the great Government Departments, such as the Local Government Board, H.M. Office of Works and the Board of Education, have notified their intention of being represented by delegates, as have also some thirty municipalities, including cities like Edinburgh, Birmingham, &c. Further, the Metropolitan Asylums Board, several similar institutions, some of the City companies, such as the Joiners' Company, the Tyler and Bricklayers' Company and quite a number of the principal technical and scientific societies have decided to send delegates. The National Fire Brigades' Union, the new Association of Professional Fire Chiefs and the Private Fire Brigades' Association will naturally be strongly represented. Further, nearly all the great American and Continental organisations interested in the subject have already decided to send deputations, foremost among them being the National Fire Protection Association of America and the International Association of Fire Engineers of America, while the great central authority, the International Council of Fire Brigades, will be sending almost all its officers. The Congress offices will be at 1 Waterloo Place, S.W., where particulars can be obtained from the hon. secretary. Those desiring to participate in the discussions or present papers should make their applications before the end of March.

FIREPROOF BUILDINGS AT BANGOUR ASYLUM.

AT a meeting of the Edinburgh District Lunacy Board—Mr. Richard Clark presiding—Mr. Williamson said he was glad to see the committee were taking steps to see that the new asylum buildings at Bangour were fireproof. He was not yet satisfied, however. They still had a good deal of wood in the construction of these buildings where, he thought, there should be iron. The Chairman said they could not classify the buildings they were going to erect as temporary buildings. The fire in Colney Hatch took place in temporary buildings, not in any way similar to the buildings they intended to erect. In the first place, they had corrugated iron as a shell, inside that they had non-inflammable felt, then

a "fram" boarding $3\frac{1}{2}$ inches thick of solid concrete and non-inflammable. Above that they had a composite of asbestos. There was not the least danger of these buildings proving more inflammable than ordinary stone and lime buildings—in fact, they were safer. Every precaution had been taken against fire. Then they were going to have exits from the ground floor by French windows, while in the upper floor there would be outside as well as inside exits. Altogether he thought they could assure the citizens that there was absolutely no danger whatever from the buildings they were going to erect. There would be no corridors similar to those at Colney Hatch, where, he thought, the corridors did most damage. They had a good supply of water, and only forty-five persons would have been in each house instead of a big number. The minutes of the meetings of committees contained a letter from the General Board of Lunacy for Scotland with regard to fire risks, and the District Board's assurance that the General Board's desire was being kept in view. The minutes also showed that the asylum committee had accepted the estimate of 15,052*l.* of Messrs. Bain & Co., Coatbridge, for the erection of five villas and laundry at Bangour, it being agreed to arrange with Messrs. Bain & Co. to make some alterations on the elevations submitted more pleasing to the eye at a cost of 25*l.* per villa or thereby. The minutes were approved.

MR. WM. POWELL, a Liverpool merchant, has invented a new process of vulcanising timber, the agent employed being a solution of raw or common refined sugar, applied by means of saturation at boiling-point, the water being afterwards evaporated at a high temperature, and the result is to leave the pores and interstices of the wood filled in with solid matter, and the timber vulcanised, preserved and seasoned. The nature of moderately soft wood, it is claimed, is in this way changed to a tough and hard substance, without brittleness, and also without any tendency to split or crack. It is also rendered remarkably impervious to water. Hard woods similarly treated derive similar benefits. An important advantage of the process is its rapidity, two or three days sufficing for the conversion of soft into hard wood. The invention, which has been patented, is to be brought before the attention of the timber trade by a series of practical demonstrations and lectures.

TRADE NOTES.

MESSRS. JAS. LATHAM, LTD., timber and moulding merchants, of Curtain Road, E.C., are issuing a useful little letter-clip which they will be pleased to send on receipt of application to any of our readers.

MR. WM. E. FARRER, of 36 Cannon Street, Birmingham, has removed his works from Fawdry Street, Smethwick, to larger and more commodious premises, the Star Works, Cambridge Street, Birmingham.

THE Government entrusted to Messrs. Boulton & Paul, Norwich, the order for 150 wooden bungalows to be used as officers' quarters. Each is upwards of 80 feet in length and some 22 feet in width, and contains six rooms, with bath-room attached.

THE town hall, Dumfries, is being fitted with the well-known "Small Tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, employing their improved economical coil-heater with waterway firebars. The ventilation of the building has also been placed with the same firm, employing their patent tubular exhaust ventilators, which are guaranteed to be absolutely weatherproof.

MESSRS. MELLOWES & CO., of Sheffield, and 28 Victoria Street, London, have received the order for covering with the patent "Eclipse" glazing the roofs over the new station at Wemyss Bay, on the Caledonian Railway, the new shed for machinery at Bolton for the London and North-Western Railway, and also extensions at Messrs. Swan & Hunter's shipbuilding yard, Wallsend, Newcastle-on-Tyne.

WE are again able to congratulate the shareholders in John Oakey & Sons, Ltd., on the satisfactory nature of the report presented at the annual general meeting on Thursday night, 19th inst. It appears that the net profits for the year amount to 29,196*l.* 18*s.* 6*d.* A dividend of 6 per cent. per annum has been paid to the preference shareholders and the interim dividend of 5 per cent. to the ordinary shareholders, absorbing a sum of 12,250*l.*, leaving a balance of 16,946*l.* 18*s.* 6*d.* From this balance the Board recommend the payment of a final dividend of 5 per cent. to the ordinary shareholders, making a total of 10 per cent. for the year, and, in addition, a bonus of 2½ per cent., free of income-tax. They also recommend that 7,000*l.* of the year's profits be carried to the general reserve, raising this account to 56,000*l.*, making with the capital reserve a total reserve of 59,734*l.* 16*s.* 10*d.*, leaving a balance of 571*l.* 18*s.* 6*d.* to be carried forward to next year.

BUILDING AND BUILDERS.

THE project of forming an automobile track is being favourably received at Clacton-on-Sea.

AT Clacton-on-Sea a new Methodist church has been opened and a new Catholic church is nearing completion.

AT a recent public meeting held at Denholm, near Hawick, B., it was unanimously agreed to take steps for the erection of a public hall for the village at a cost of about 1,000*l*.

THE memorial-stone has been laid of a new wing, to be named the Hoyle wing, of St. Paul's Sunday schools, Bennett Street, Oldham Road, Manchester.

A SITE worth 1,000*l*. for a new church at Eastbourne has been given by the Duke of Devonshire. Several thousand pounds towards the building fund have also been raised.

THE construction of the new post-office at Llandudno has commenced. It is interesting to note that the postal business at Llandudno is the third largest in the principality.

WORCESTER is shortly to have a new arcade running through from Church Street to St. Swithin's Street. The architects for this improvement are Messrs. Clare & Ross, of Salisbury Circus, London.

UP to the present the expenditure on the widening of the Blackpool promenade has amounted to about 50,000*l*., and upon a sixth of the work has been completed. Four hundred men are employed daily in carrying out this great improvement.

A GABLE at the Rinslip station of the Harrow and Uxbridge Railway, in course of construction, collapsed on Tuesday afternoon, and buried four workmen who were on the scaffolding. Fortunately there was no fatality. The most severe injury was compound fracture of one man's leg. The three others were freed about the head and body.

AT Dunfermline Dean of Guild Court on Monday a petition was presented on behalf of the trustees of the late Mr. William McLaren for the erection of a church, church hall and vestry in connection with the Church of Scotland on the site of the present iron church at Brucefield. The plans, which are by Mr. McGregor Chalmers, architect, Glasgow, were passed. The cost of the building is to be between 5,000*l*. and 6,000*l*.

AT the last meeting of the Rural District Council of Bedford, Notts, detail plans and estimates were laid before the council for the Selston sewerage and sewage disposal, and

were unanimously adopted. A resolution was passed instructing the engineers to forward them to the Local Government Board and asking for sanction to a loan of 22,000*l*. Messrs. Sands & Walker and S. Maylan, Angel Row, Nottingham, are the engineers to the scheme.

THE highways and improvement committee of the Leigh (Lancs) Town Council have resolved to reconstruct Butts Bridge, which carries the Leigh to Warrington highway over the Bridgewater Canal, to a width of 40 feet, at an estimated cost of 1,097*l*., provided the County Council will contribute one-half the cost. It is also proposed to widen Parsonage Bridge and Westleigh Mill Bridge. Pennington Mill Bridge is now undergoing reconstruction.

ELECTRIC NOTES.

AN electrical exhibition will be held at the town hall, Rhyl, on the 11th, 12th and 13th prox.

MR JOHN TAYLOR, A.R.I.B.A., of Longton and Leek, has been appointed architect for the new electric-light station for the Leek Urban District Council.

A MEETING of Clacton ratepayers, convened for the consideration of the electric-lighting scheme, favoured an application for an extension of the Council's provisional order for two years.

THE Glasgow section of the Institution of Electrical Engineers met in the rooms, 207 Bath Street, Glasgow, on Tuesday, the 10th inst., Mr. Mavor, president of the section, in the chair. Mr. M. B. Field, M.I.E.E., A.M.I.C.E., gave a paper on "Electrical Phenomena by the Aid of Oscillograms." He explained that his subject was more particularly some aspects of electrical resonance which occurred to him on observing the shape of the E.M.F. wave of the 2,500 kw. generators of the Glasgow Corporation Tramways Department. These curves were depicted on the tracing-desk of one of those instruments invented by Mr. Duddel, viz. the high frequency pattern of oscillograph. Regarding the oscillograph, he said it was a very powerful weapon in experimental research. It was only given to mathematicians to see clearly with the mind's eye the full physical interpretations of their symbols; to ordinary engineers who made no pretensions to wielding the mathematical weapons, an optical investigation of such phenomena brought home in a clearer way than pages of mathematics what was

JENNINGS' PATENT DUPLIX BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTE.

Upwards of 5,000 in Use in Various Parts of the Country in Public Baths, Asylums, Hospitals, Infirmarys, Hotels, and Private Houses.

Cold water can only be admitted first, thus preventing damage to the Bath, and injury to Bather from scalding.

Supplied to H.M. the King at Windsor Castle, and various Residences of the Nobility.

really going on. A discussion followed the reading of the paper, and Mr. Field was cordially thanked for his contribution.

THE Corporation of Bath were to have resumed, on Tuesday, their consideration of the recommendation of the electric-lighting committee to raise a further loan of 50,000*l.* for the improvement and development of the undertaking. Letters were read from the chairman, however, of the Bath Electric Tramways, Limited, (Sir Vincent Caillard), submitting a proposal, subject to the result of an examination of the books and accounts of the Corporation's undertaking. "My company," wrote Sir Vincent, "would be prepared to take a lease of the electric-lighting undertaking for the period necessary for the redemption of the Corporation's electric-lighting loan, and to guarantee the Corporation during such period the interest and sinking funds on such loans, the undertaking becoming the property of my company at the end of such period. My company would make themselves responsible for the raising of such further capital as may be required to put the undertaking on a thoroughly sound basis and to extend and work it in the future, and they fully believe that with judicious expenditure they would be able to materially reduce the present cost of lighting. In the event of there being any legal difficulties as to the powers of the Corporation to give effect to the above proposal, my company would be prepared, at their own expense, to apply for a special Act of Parliament, if necessary, on the understanding that the Corporation lend the company their active support in obtaining the said Act." They would be prepared also to pay down the amount the Corporation have already set aside for redemption of capital (8,000*l.* or 10,000*l.*). It was moved by Mr. Tonkin that the offer could not be considered, but an amendment moved by Mr. Matthews was carried by twenty-three votes to fifteen, providing for the consideration of the matter by the electric-lighting committee. A report is to be presented within fourteen days.

VARIETIES.

BLACKPOOL'S third new Board school was opened on Monday. They have each cost over 20,000*l.*

NEW schools to accommodate 400 children, erected by the Machynlleth School Board at a cost of 4,050*l.*, have been opened.

THE Bloemfontein Town Council contemplate extending their sewerage system at a cost of 73,000*l.* and erecting waterworks at a cost of 150,000*l.*

THE town clerk of Cheltenham, Mr. E. T. Brydges, is about to resign, and the Town Council intend to advertise for a successor at a salary of 600*l.* a year.

THE Manchester City Council on Wednesday agreed to appoint a special committee to inquire into the form of contract used for the Corporation works, in order that an arrangement can be made which will be acceptable to all concerned.

THE new district church of St. John at High Wycombe, which has been built in the industrial portion of the town to meet the needs of increasing population and for the extension of church work in the neighbourhood, was consecrated on 12th inst.

ON Saturday last the members of the Birmingham Technical School Engineering Society were shown over the Worksop Bromwich sewage disposal works, the sewage being treated bacterially. They were then driven to the tramway works for a course of construction, and afterwards visited the generating station, in which are installed Parson's steam turbines driving dynamos of 100 and 50 kilowatts capacity. A ride on the latest type of car, terminating at the town hall, where the Greatorex entertained the members to tea, brought a most instructive visit to a close.

THE church of St. Martin, Yapham, Yorks, an ancient chapel and still included in the living of Pocklington, has undergone the process of complete restoration, and was opened for service on the 11th inst. The work has been fully carried out by Mr. Wm. Anclay, of Doncaster. Included in his work are a new roof covered with red Staffordshire tiles and stone ridge, a new bell turret and the rehanging of bells, repair of the gables, replastering of the walls, new chancel step and floors, and a new east window of stained glass lights.

THE twenty-second annual meeting of the members of the Sanitary Assurance Association was held on Monday last at the offices, 5 Argyll Place, W., Mr. Andrew Stirling, president, in the chair. In the annual report the Council expressed regret that the principle of sanitary registration of dwellings in other buildings as first embodied in the Sanitary Registration Bill promoted by the Association has not yet received the sanction of Parliament. The income of the year was 23,000*l.* which, after meeting all liabilities, left a balance in hand.

Trade Mark.

Registered Stamp on each Mantle.

THE "VIVID"

GREAT LIGHT. LONG LIFE. RELIABLE.

Patented in Great Britain, Germany, and United States of America.

NOTE.—Buyers and Sellers of and Dealers in the "VIVID" Mantle protected from interference and litigation by an order of the Court of Justice (Chancery Division), dated June 20, 1902.

Why is the "VIVID" stronger and its light superior?

The Thorium Arsenate of the fluid used in the manufacture of the "VIVID" forms in the heat, such crystals not only covering the threads, but also filling the threads in. These crystals are practically indestructible in the heat. In other Mantles Thorium is produced in the heat in the form of powder, and this gradually is destroyed, at the same time setting free acids which are so destructive to the mantles.

Crystals with their many facets at different angles must naturally reflect light better than a body of a powder which does not refract and cannot be so cohesive.

It is also very important to know that in the "VIVID" no acid is liberated at all.

The "VIVID" Patent Incandescent Mantle

OFFICES AND WAREHOUSE: 60^A WILSON STREET, LONDON, E.C.

report was adopted and the retiring members of the Council—Professor T. Roger Smith and Mr. Mark H. Judge—were re-elected.

At a meeting of the Court of Common Council, the Lord Mayor presiding, the streets committee laid before the Court report recommending that the carriageways of some dozen streets in the City should be laid with asphalt at an estimated cost of 2,570*l*; that the footways of a large number of streets be laid with asphalt at an estimated cost of 3,473*l*; that the carriageway of the Minorities be relaid with asphalt at an estimated cost of 4,040*l*; and that the carriageway of Fleet Street from Bouverie Street to Temple Bar be relaid with asphalt at an estimated cost of 3,265*l*. In all, the expenditure would amount to over 16,000*l*. The recommendations were adopted with the exception of that relating to the Minorities, which was referred back to the committee.

The fifth sessional papers meeting of the Manchester Society of Architects was held on February 12, when Mr. E. Percy Hinde, A.R.I.B.A., read a paper on "Some Elementary School Buildings." The chair was taken by Mr. J. D. Mould, in the absence of the President. The lecturer pointed out the principles that affected school planning, and showed how the new code modified largely previous conditions. Plans of school buildings of various types were hung on the walls to illustrate the lecture. Mr. Willoughby moved a vote of thanks to the lecturer, which was seconded by Mr. Hodgson, and carried unanimously. The subject for the Society's last monthly competition for students was a Sundial. The prize was awarded to Mr. C. H. Potter, and a special prize to Mr. F. Osler. Messrs. A. Maclaren, Frank Dyer, R. J. Vernon, Q. M. Bluhm and Norman Taylor were awarded honourable mention.

The monthly meeting of the Institute of British Decorators (Irish Branch) was held at the rooms, Exchequer Chambers, Dublin. In the absence of the Vice-President the chair was taken by Mr. Alexander Thompson, of Belfast, president of the Irish Association of Master Painters. Advantage was taken of the presence to hand the prizes and certificates won at the Belfast Convention to the boys resident in Dublin. In doing so Mr. Thompson gave testimony to the quality of the work exhibited. Mr. Sibthorpe then delivered an interesting lecture on the spirit of the Quattrocento in Italy, which was profusely illustrated by lantern-slides. Mr. Gibson, in proposing a vote of thanks to the lecturer, said that he had rarely listened to a more instructive lecture. Mr. McIntyre seconded the motion,

which was carried unanimously. Mr. Nairn proposed, and Mr. Marks seconded, a hearty vote of thanks to Mr. R. Keatinge and Mr. Wilkins for their admirable management of the lantern. Mr. Keatinge showed a large number of slides illustrative of the decorators' visit to Italy, which were much appreciated.

LAXTON'S PRICE BOOK.

THE familiar "Laxton" has gradually lost its original slimness and is now a portly volume of 700 pages, besides advertisements. The growth in capacity corresponds with the progress of building, which is now the most multiplex of all industries. Exactness and completeness are the dominant qualities of "Laxton." The publishers have so efficient an organisation that they are able to obtain the latest information and to warrant its correctness.

THE BUILDERS' ASSOCIATION HANDBOOK.

THE "Diary and Handbook" of the London Master Builders' Association has necessarily the highest authority as a book of reference. The information is of the kind which experience has shown to be most often required in everyday business. Colonel Stanley Bird contributes a history of the Association, a subject on which he is an authority. The Association's form of contract is given, besides various other official documents with which acquaintance is necessary.

IRISH MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the Irish Master Builders' Association was held in the Antient Concert Rooms, Dublin, on the 12th inst. The room was tastefully decorated, and a large company sat down to dinner. Mr. J. Beckett (president M.B.A.) presided.

The Chairman gave the toast of "The King and his Gracious Queen," which was heartily honoured, and he then gave the toast of "Prosperity to Ireland," to which Sir Antony

MacDonnell responded at some length, his remarks being greeted with great applause. The Chairman then gave the toast of "Our Guests," to which the Lord Mayor replied. Other speeches followed, and the Chairman's health having been honoured, the company separated.

AMERICAN HIGH BUILDINGS.

IN a review of construction during the past twenty-five years, Mr. F. W. Skinner, in the *Engineering Record*, says:—Foundations for buildings are carried down to an indefinite depth through quicksand to hard strata, in open shafts, by the hydraulic caisson process, and foundations supporting immovably the most enormous loads are carried down to solid rock 100 feet below the water-line through mud, water, quicksand and any obstacles by the pneumatic caisson process, which was first applied to buildings in 1893. An important modification of this process enables a continuous masonry dam to be carried down to solid rock, through the worst soils, so as to permit the excavation of four or five storeys of a great building below ground water-level, and exclude the water and resist the great hydrostatic pressure on the cellar walls, as in the New York Stock Exchange. Progress has been made with a system of building foundations at great depths under ground in the worst quicksand, in totally inaccessible places, by the injection of grout in such a manner as to form masses of concrete in any desired shape and position.

In bridgework river piers are commonly made by pneumatic caissons which have been sunk more than 100 feet below water-level, and have been built in almost all parts of the world since the first important one in this country was built for the Glasgow Bridge over the Missouri. Great improvements have been made in sinking crib or open caisson foundations by internal dredging to depths beyond the limits of pneumatic caisson-work, and especially in depositing concrete in them by automatic buckets opening under water as for the Poughkeepsie, Omaha and interprovincial bridges, and by travelling chutes depositing it in continuous layers protected until placed, as for the Charlestown bridge. For sea walls, docks and quays valuable and ingenious methods and appliances have been devised for casting and handling on shore concrete blocks up to 500 or more tons weight, and they have been constructed in place weighing up to 5,000 tons by special caissons, as for the Antwerp quay wall and for the Port de Bizert.

Consonant with these substructure constructions has been the underpinning of tall and heavy existing structures, which is usually done when they are in a precarious condition, and great skill and experience are required. Old methods were practically confined to the use of wooden needle beams passing through the walls. The twelve-storey wall of the Decke building, weighing 76,000 lbs. per linear foot, was a few months ago supported on double tiers of deep steel beams and its footing removed, and a new one built and carried down to the solid rock. In other cases the walls have been temporarily supported entirely from the inside or from the outside by elaborate systems of inclined shores and girders or by cantilevers. Piles are driven horizontally under heavy foundations to increase their bases, or they are extended by eccentric additions put in equilibrium by cantilever reaction girders as in the Morse building. The weights of weak or heavily loaded walls are carried down to solid rock on lines of slender columns sunk 100 feet through quicksand and boulders by the Breuchaud process without jeopardising the stability of the building, entering its cellar or obstructing the adjacent lot. Tipping piers and tall monuments with loads aggregating thousands of tons are underpinned by driving successive tunnels beneath them and filling the tunnels with masonry. The foundations of occupied tall buildings are entirely rebuilt, the superstructures are lifted 20 feet and new storeys are built under them; whole fronts are taken out and replaced, intermediate storeys are rebuilt or new storeys erected above the roof, sometimes supported on outside new foundations, all without materially interfering with the occupants. Large brick buildings are raised or lowered many feet or are moved several blocks and around corners or across large rivers without being vacated or injured.

The safety, rapidity and economy of constructing tall and heavy buildings in crowded city thoroughfares where there is no storage room and the streets cannot be obstructed have been greatly promoted by revolutionary improvements within the last score of years. The cellars are entirely covered by street-level platforms which double the area for storage and machinery, while the foundation piers are built under them and the framework erected over them long before the excavation is completed. Vaults are built far under the street beneath temporary double-deck bridges which provide office room and workyards above the sidewalks on their roofs which serve the additional purpose of protecting pedestrians. Ten-ton caissons drawn by a score of horses are quickly swung into place by

tral derrick or by a boom mounted on a timber tower which
ers, without obstructing, the street, and moves back and forth
command the whole foundation area, while the tower affords
e storage room on its decks. Girders weighing thirty
s are lowered many feet to the cellar floor in a few minutes.
ousand tons of columns and beams are erected in a few
ks to form the twenty-storey superstructure, by special
pments of hoisting apparatus which may consist of a slender
er reaching from the cellar to the topmost storey, or of
elling derricks rising with the structure and moving over
parts of the skeleton floors to handle every column and
er. Steam and compressed air from the cellar are piped
over the building to operate the hoisting engines and
omatic rivetters, chisels and drills. The walls are simulta-
neously built in half a dozen different horizontal belts before
framework is finished. Mortar is delivered ready mixed
a central station miles away and hoisted to place by swift
ing steam elevators. Waggon loads of brick or steel are
ing in one operation from the street to the top of the work
distributed on railroad tracks, and the million-dollar
ding is completed and ready for its thousands of tenants
in a year from the time the first work was commenced on
foundations.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

annual dinner arranged under the auspices of the
Nottingham Master Builders' Association was held on Friday
at the Victoria Station Hotel, Nottingham. Mr. Henry Vickers
(ident) occupied the chair.

After dinner the Chairman submitted the loyal toast, which
was enthusiastically honoured.

Mr. W. Edgar, ex-president, submitted "The Mayor,
Aldermen and Corporation of Nottingham."

Councillor Jno. Wright replied, and spoke at length of the
magnitude of the various undertakings managed by the
Association, urging that they were conducted to the advantage
of the ratepayers of the city. With regard to the gas depart-
ment, however, he advocated that the price to the consumer
should be reduced, and that less should be devoted to the
cost of the rates. Councillor Wright also made mention of
the education question, the administration of the licensing
act, and a variety of subjects of interest to the building trade.

Mr. J. H. Vickers proposed "The Architects," observing

that at the present time, and for a considerable time past,
there had been absolute peace, harmony and concord existing
between the architects and builders, and he expressed the hope
that that condition of things might long continue. He heartily
welcomed the gentlemen representing the old profession of
architecture who had accepted the invitation to be present at
the annual reunion of the members of the building trade.

The names of Mr. W. D. Pratt and Mr. E. R. Sutton were
associated with the toast, which was cordially honoured.

Mr. Pratt, in reply, emphasised the importance of co-
operation between the architect and builder, and suggested
that the master builder ought to be most careful in the selec-
tion of his foremen and operatives, upon whom so much
depended.

Mr. E. R. Sutton also responded, and mentioned the great
improvement made in the forms of agreement between
architects and builders, and the satisfaction which the almost
universal inclusion of the arbitration clause in contracts had
given. In the past, Nottingham had experienced considerable
difficulty in obtaining good timber, and at one time Notting-
ham was supplied with worse timber than any other town, but
he believed it was all a question of price. He hoped the matter
would be remedied. Mr. Sutton also alluded to the question of
cost.

Mr. Thomas Flewitt next submitted "Success to the
National Federation and the Nottingham Master Builders'
Association," observing that the builders were to be congratu-
lated upon the absence of any trade dispute during the year.
In the past the Association had probably been looked upon
with a certain amount of suspicion, an idea having prevailed
that its operation would lead to an increase of lock-outs and
strikes; but, as a matter of fact, its influence had been in the
contrary direction. Mr. Flewitt raised a protest against the
Corporation undertaking work that could be more economically
done by contractors. They might, however, easily clear away
some of the slum property, and leave it to speculative builders
to erect suitable houses in their place. It was to the interest
of the Association to see that good work was done, and for
that reason it deserved the hearty support of all engaged in
the building trade. The toast was duly honoured.

Mr. Chambers (Leicester) responded, and referred to the
National Federation as an organisation established on good
grounds with the object of benefiting the building trade
throughout the country. He regarded the federation as the
House of Lords, and the Midland and other centres as being

the House of Commons. The brunt of the work would have to be undertaken by the various centres. The representatives upon that body had but one object before them, and that was to elevate one of the foremost and oldest trades in the country, and one which distributed an enormous amount of money. Mr. Chambers spoke of the value of organisation. They had been working some time for a national form of contract, and he hoped it would become an accomplished fact before long, because the varieties of agreement adopted now led to very great difficulty.

Mr. A. E. Tallis also replied.

Other toasts included "The Visitors," submitted by Mr. James Wright, and "The Chairman." During the evening the members of the Cecilia Glee Quartette (Messrs. F. W. Ball, J. Turner, G. W. Penn and E. S. Edgar) collectively and individually contributed to an excellent musical programme, the various items being keenly appreciated. Mr. Quinton Richardson sustained the humorous element admirably, and Mr. A. Williamson presided at the pianoforte and played the accompaniments and various selections with skill and discrimination.

THE AUCTIONEERS' INSTITUTE.

At the meeting of the members of the Auctioneers' Institute, held on Friday night at Hamilton House, Victoria Embankment, under the chairmanship of Mr. John Hepper (president), Mr. W. G. Nottage read a paper on "Registration of Title to Land (Land Transfer Acts, 1875 and 1897): How it Affects the Auctioneer."

Mr. Nottage said he thought it might be taken for granted that the adoption throughout England and Wales of the compulsory provisions of the Land Transfer Acts was only a question of time. He also thought that the chief reason why the Act was not in force in any county except London was because not one landowner or prospective landowner in a hundred knew of the advantages of the system. The opposition of a section of the legal profession should not, he thought, be considered too seriously, as all solicitors were not opposed to it. Speaking of the different classes of title—absolute, qualified and possessory—Mr. Nottage said that in all probability a new rule would shortly come into force which would materially assist the applicant for an absolute title, as far as the cost was concerned. It would be to the effect that on an application for an absolute title (either on first registration or to convert a pos-

sessory into an absolute) the fee to be then paid would be considerably less than at present, and would be made to include all incidental costs hitherto borne by the applicant. He hoped that the scheme suggested for the automatic conversion of a possessory title into an absolute one would no longer be deferred, as it was that which owners of land and business men generally required. It was, he said, somewhat startling to learn that a system had been devised by which a fee was perfectly safe to buy, sell or charge land by merely reading a few entries in a book, or writing a few words on a printed form; but as auctioneers were up-to-date men of business, would not surprise them so much as it did some other members of the community. Many of them must often have deplored the hindrance to their business which the old system of conveyancing entailed, and have wondered why a cheap, simple and safe system, analogous to that which was in vogue in some of our colonies and in many European countries, could not be created. Having mentioned that another feature of the registration system was the facility with which temporary loans could be effected, he expressed the opinion that the new scale of charges under the registration system would prove to be very remunerative to the solicitor concerned, as the work and responsibility would be so greatly lessened.

A discussion followed.

STEAM PIPES.

At the last meeting of the Gloucestershire Engineering Society Mr. C. E. Stromeyer, M.I.C.E., read a paper on "Steam Pipes." He said that the duty of steam pipes was to convey steam from the boiler to the engine with as little loss as possible, and with the minimum risk. There must be a certain dimension for which the sum of percentage of steam condensed and of pressure lost was a minimum. Theory had not as yet solved this problem, and for the present practical experience had to be their guide. When steam pipes were of considerable length their expansion and contraction, due to heating and cooling, were the cause of various troubles. The size and shape of steel pipe bends were not easily determined, but according to a calculation he had arrived at the conclusion that steel pipes could be sprung twice as far as copper pipes without acquiring a permanent set. Doubtless there was a slight danger in straining copper beyond its elastic limit, and as steel could not be used with superheated steam, steel seemed to

better material all round. The question of rigidity was an important one in many respects. After going into a few technical details, the lecturer went on to state that of many steam-pipe arrangements, had had to be criticised by and the need for the warnings contained in his paper had at once been evident when he mentioned that probably per cent of all stationary boilers were provided with steam pipes which, if the ordinary conditions of handling the stop valves were only slightly departed from, might readily bring about water-hammer blows and even explosions.

ALL OF ST. MARK'S TOWER, BANGALORE.

collapse of the new tower of St. Mark's Church, and the age done to that edifice, the oldest church in the large and military station of Bangalore, does not impress natives a belief in British skill. The damaged church, with its old tower, occupies one of the most conspicuous positions in Bangalore, facing the parade ground. *Indian Engineering*, in writing the history of the work, says:—

"The improvement of the old church of St. Mark's was a matter of much concern to all Bangaloreans for many years. Military and civil worship there, and the barn-like appearance of the old building annoyed everyone for a long time, and a wish to see an alteration was natural, but for some unexplained reason the Madras Government refused to sanction the funds. This went on till the Rev. Mr. Barry became chaplain of St. Mark's, when he went about with energy and devotion, raised 10,000 rupees by private subscriptions, expecting the Government of Madras would have added another 10,000 rupees, which would have been sufficient for all the improvements contemplated. But this the sleepy, feeble Government of Sir Arthur Havelock refused to do, and His Excellency Lord Curzon had to be appealed to. The electric current set in motion from Government House, Calcutta, can hardly be imagined than expressed. The shock so roused up Sir Arthur Havelock that he afterwards sanctioned over 10,000 rupees for the improvements to St. Mark's Church, or over five times as much as was first asked for and refused by him. It is a tableau which ought to be stamped on the minds of local and provincial Governments. After much thought and deliberation with the lay trustees and leading members of the church, a plan was evolved which met with the approval of all,

and which was to cost within 20,000 rs., one-half of which the people paid for. When it was known that the Government of Madras was willing to grant the necessary funds this plan was submitted by the Commanding Royal Engineer to his immediate superior for formal sanction, and this officer sent the plan to the Government of Madras in accordance with procedure. The plan was in due course sent to the consulting architect for opinion. But that officer, it is alleged, having views of his own in the matter, after obtaining the necessary authority, sat down and drew another on totally different lines and costing more than twice the first plan; and after obtaining the approval of the bishop to his design, submitted it to the Government of Madras for sanction. That Government sanctioned the plan and allotted more than four times the money originally asked for, and moreover allowed its architect to erect his own design. The disregard of the chaplain and his people, who had struggled so long to improve the old church, by having a design foisted on them so different to what they had planned and desired, requires explanation.

People were certainly much surprised at the parsimonious Sir Arthur sanctioning so expensive a design, and at the still more expensive arrangement of having his architect go all the way to Bangalore, entirely outside the limits of his Presidency, to supervise its construction. All this was so unnecessary. There was the Commanding Royal Engineer and his staff, who actually held charge of the church, to do what was required. If a specialist in building construction was considered necessary, they had one at hand in the Executive Engineer of the Bangalore Municipality. Anyway, the ruined tower and church are now the most depressing result of the arrangement.

WIDENING OF HAMPSTEAD ROAD.

WE have on several occasions called attention to the necessity for the immediate widening of Hampstead Road at its southern end where it joins with Tottenham Court Road. This improvement is authorised by Parliament, and has already been five times sanctioned by the County Council; but it has been allowed to lapse owing to the refusal of the local authorities to permit a tramway to run down Tottenham Court Road. The improvements committee in their last report say they feel that the Council would not be justified in delaying the

ANDREW WILSON writes as follows:—"The Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases."

BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.

improvement, as the narrowness of the existing road is the cause of frequent accidents, and any postponement of the work must be attended by material increase in the cost. Moreover, they consider that when the road has been widened the Council would have removed all possible ground of objection to the tramway. The gross cost of the improvement is estimated at 245,000*l.*, of which 240,000*l.* represents the cost of acquiring property. The St. Pancras Borough Council will contribute one-eighth of the net cost. It is estimated that the net cost to the Council will be about 198,000*l.*, which represents an annual charge on the rates of 9,800*l.* for interest on and the repayment of debt, and is equivalent to a rate of 059*d.* in the pound for the first year after the improvement. It is expected that the ultimate net cost will be reduced by the proceeds of an improvement charge to be levied on owners of property benefited by the improvement. In a special report upon the subject the highways committee point out the obvious advantage of provision being made to enable persons to travel by tramway from the northern part of London to Oxford Street, and state that their chairman (Mr. Benn) will move to add an amendment to the effect that no expenditure shall be incurred upon the improvement until the St. Pancras Borough Council has given its consent to the tramway.

THE CENTRAL LONDON RAILWAY.

A REPORT has been prepared for the public health committee of the London County Council, giving the results of chemical and bacteriological examinations of the atmosphere in the stations, lifts, passages and tunnels on the Central London Railway.

The chemical examination consisted in the determination of the amount of carbonic acid in the air, and of the amount of oxygen absorbed from permanganate by the organic matter present in the air. Over 100 samples taken at different periods last year were examined. It was found that the quantity of carbonic acid in the air of the railway varied considerably, while the quantity present in the air outside varied only to a slight extent. The amount of organic matter present in the air of the tubes underwent considerable fluctuations. The general result of the chemist's examination shows that the quantity of carbonic acid was highest in the air of the carriages, and that, contrary to what might reasonably have been expected, the largest quantity, 14.7 volumes in 10,000

volumes of air, was not found in the carriages where smoking was allowed, but in an ordinary passenger carriage. The smallest quantity found (9.6 volumes in 10,000 of air) was in an empty carriage. The air in the passages leading from and to the stations was generally better than in the lifts. On one occasion the air in the lifts at the Oxford Circus station contained 15.2 volumes of carbonic acid in 10,000 volumes of air, or about four times the quantity found in the fresh air outside the station. Several samples of air were collected at midnight or early in the morning after the tubes had been ventilated by the passage of air, and before the morning traffic had commenced. The examination of these samples showed in most instances that a very poor condition of the air had been produced by the ventilation, although it was still somewhat inferior to that of the outside air. Generally, about 78 per cent. of the samples collected contained more than twice as much carbonic acid as that found in outside air, and 66 per cent. contained more than 2½ times as much. The chemist considers that samples of air taken at any point on the railway should not contain more than eight volumes of carbonic acid in 10,000 volumes of air—that is, no more than twice the amount which is generally found in the streets. He suggests this standard of purity in view of the fact that all the additional carbonic acid found in the air of the tunnels has been produced by respiration, and is, therefore, of a more objectionable character than that produced by the combustion of fuel in the locomotives, or of gas or oil for lighting purposes.

A few samples of air were collected from other railways, and their examination shows the following results in volumes of carbonic acid in 10,000 volumes of air:—City and South London Railway, at London Bridge station, 7.6; in an empty carriage, 14.1; Metropolitan Railway, empty carriage, between Edgware Road and Portland Road station, 16.0; empty carriage between Baker Street and Gower Street stations, 28.0; District Railway, empty carriage, between Mansion House and Temple stations, 15.1.

Dr. Andrewes made bacteriological examinations of twelve samples of air from different points on the Central London Railway, and compared them with twelve similar samples taken at the same time from the fresh air outside. In summarising the results Dr. Andrewes concludes that while micro-organisms are present in tube air in a somewhat greater proportion (thirteen to ten) than in fresh air, the excess is not so considerable as to cause the tube air to compare unfavourably with

the conditions known to exist in inhabited rooms generally, and although there was considerable excess of organisms capable of growing at the temperature of the body, this excess was due to non-pathogenic sarcinæ and allied species, and no pathogenic organisms were found in the tube air. The highest averages were found in carriages and lifts—i.e. in the most crowded places examined—while the platforms and passages came out actually better than the fresh air, and the tunnels were only a little worse. There was a direct correspondence between the amount and concentration of human traffic and the number of organisms in the air.

In concluding their report, the committee state that they have been informed that the Central London Railway Company are taking steps to improve the ventilation of the tunnels by installing a large rotary fan at the Shepherd's Bush end, which will be powerful enough to draw out all the tunnel air three times in the three hours during which the traffic is stopped at night. They also state that the company are installing at the Bank station an air-compressor which will force compressed air drawn from the street level into the extreme end of the Bank sidings while the trains are in motion and thus purify that part.

IMPROVEMENTS IN MILITARY BARRACKS.

A SPECIAL correspondent of the *Times* writes on this subject:—It became clear some two or three years ago that something must be done in the direction of securing occasional privacy in barracks for the soldier, and those persons who assert that nothing has been done are grievously in error. As a matter of fact the conversion of existing barracks to the cubicle system has been tried at Woking and in Dublin, and the experiment has been full of practical value; it has been productive, too, of lessons that were apparent to me after inspection of the Woking barracks, which consist of one of the buildings, visible from the South-Western line between Woking and Brookwood, formerly used as a prison. The soldier has never been better housed than in that sometime prison. There such barrack-rooms as are used as common bedrooms are beautifully high and airy, with abundant space, and heated by hot-water pipes or radiators. The dining-rooms are separate. There are a recreation-room, with billiard tables (a regimental investment which pays its own way) and bagatelle tables provided by the War Office; a library, a reading-room, with a

space curtained off for private writing; a coffee bar, which takes more money than the wet canteen; tailors', carpenters' and shoemakers' shops; schools for adults and children, a Morris Tube range and a gymnasium. The married quarters, small houses formerly occupied by the warders and their families, are excellent. Other houses there are, too, adequate in point of size and with capabilities of pretty environment, for married officers, although for some reason or other the authorities have permitted them to fall into a shocking state of disrepair.

But it is with the cubicles, and with the opinions of the men concerning them, that I am principally concerned. They are of three types, all of them having certain features in common. That is to say, each has partitions and door about 8 feet high; each is furnished with a spring bed, mattress and blankets, a cupboard, a table and a chair, and each has a window or part of a window. And here let me pause a moment. Woking Prison was not designed for conversion into barrack cubicles, and the loss of accommodation, that is to say, in the number of men who can be accommodated in a given space in cubicles, as compared with a barrack-room, is larger than it would be in a specially-designed building, simply because the windows are not numerous enough for the purpose. At Woking it is 33 per cent. In any case, it is clearly undesirable that two men should share one window, since recognition of the merits of fresh air—and the air of Woking can be very fresh indeed—is by no means universal in the class from which recruits are drawn. The differences between the cubicles are that in some the partitions cease 5 or 6 inches from the floor, whereas in others they reach the floor all round, in others all round save at the door. The first type is recommended by some on the ground of cleanliness, there being none of the dust traps in corners which housewives know; while, on the other hand, it is objected to on the ground that it promotes draughts and that cubicle neighbours will be apt to sweep into the cubicles of one another. Again, in some cases the cubicles are warmed by pipes running through them, in others by radiators in the central corridors. The former are naturally much preferred, because they give a sense of personal warmth, although, as a matter of fact, the radiators heat the whole of the cubicled dormitory in a very efficient manner. Truth to tell, the soldier does not like either the one or the other, but has, as most of us have, an unreasonable prejudice in favour of the more cheerful, but far less effective, fire of coals. To some of us, brought up on the Spartan lines of years not so very long

gone by, it will be in the nature of a revelation that it is considered necessary to warm the soldier's sleeping-place at all. In the barrack-rooms, no less, all united in declaring that they vastly preferred an open fire, round which they could cluster and gossip (the weakest outside, although they did not mention that), to the finest of modern appliances for heating.

Cubicles are, on the whole, very highly esteemed, although in exceptional cases they have been complained of, on the ground that they are dull, and that barrack-room life is brighter. Moreover, they have produced another little difficulty. Some barrack-rooms there are at Woking, and some there always must be by reason of space, if for that reason only. In each such barrack-room there must be a non-commissioned officer, and there have been cases in which men have declined to be promoted to be unpaid lance-corporals because promotion would involve the loss of their cubicles. It has been suggested that the former objection should be got over by having the cubicles in new barracks placed adjacent to the barrack-rooms and not, as at Woking, far away from them. This suggestion would seem to imply that those who have had experience of the cubicle system think that it is not universally applicable, and that may perhaps be a shock to unthinking folks. Yet that is the deliberate opinion of those who know the soldier and are zealous in his interests. Their view is that cubicle accommodation for 25 per cent. of the men at first, and perhaps 50 per cent. later, as well as for all non-commissioned officers save those actually required in the barrack-rooms, would be amply sufficient. They would have twelve cubicles allotted to each company, and fourteen to the best shooting company, the said cubicles being assigned to individuals at the discretion of the captain of the company, subject only to the restriction that he should not assign them either to recruits, to dirty soldiers, or to bad characters. Here, it seems to me, is a real difficulty. An object, and perhaps the main point, of the cubicle system is to encourage recruiting by holding out the promise of privacy to the recruit. If he cannot be trusted in a cubicle at once, the prospect held out to him is that of a common sleeping-room in which the good characters of the regiment do not sleep. Yet how are the company officer and his subordinates to know whether a recruit is to be trusted in a cubicle until they have had some opportunity of studying his manners in a barrack-room? The question is far from being an easy one, and I confess that I see no answer to it except to trust the recruit also with a cubicle until he shall have shown himself to be unworthy of it. This, of course, would involve more cubicles,

and perhaps some risk of damage and defilement. But, as to the first objection, the loss of space in a properly designed building would be less than in a building requiring to be converted; and as to the second, it would grow less if, and as, the right class of recruit was attracted. Certain it is that the quiet man wishing to join would not be attracted by the knowledge that recruits and bad characters alone were excluded from cubicles. But perhaps it might not pass the wit of man to keep the recruits more or less segregated during a probationary period.

So much for Woking, where the cubicle system is an unqualified success as far as it goes, and is spoken of in the highest terms by officers and men. But Woking and Dublin (of which I cannot speak as a witness, since I have not seen it) are but two places, and the important question of the future is what progress has been made in the matter of other barracks. Practically that progress amounts to this. It was recommended by Lord Roberts, a year or two ago, that a special design should be prepared for new cubicle barracks to be built somewhere near London, and Windsor was selected for the experiment. Every care has been taken, after investigation by the Army sanitary committee into the principles of the construction of "cubicular" buildings used in civil life, in the preparation of this design, and the result is somewhat alarming to the taxpayer. In a word, the design involves a considerable increase in the amount of space to be allowed for each soldier, and therefore a proportionate increase in the cost of all future barracks. That increase the country will probably be prepared to bear in the case of new barracks at least as cheerfully as it endures many other imposts. But it will be remembered that a large number of barracks are now in process of construction, and a pledge has been given to the country that these barracks shall be capable of conversion into cubicle barracks if required. The space per soldier in these barracks is not so great as that which has been declared by the Army sanitary committee to be advisable in the case of the Windsor Barracks. It remains only to hope that, while the new Windsor Barracks, when they come, will represent the most complete application of hygienic principles, the barracks already under construction may be found to provide the essential amount of space per soldier, even though it be not the ideal amount. Rich as the country is, it must still be content to cut its coat according to its cloth, and to proceed by steps; and we may at least be sure that the barracks now under construction will be a great improvement on the old ones.

CABOT'S INSULATING & DEAFENING QUILT

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Dec moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

The Architect.

THE WEEK.

It is a hopeful sign for France when judges are found to be sufficiently bold to express their opinions openly about the shortcomings of works of art. The system by which the "envois" from Rome produced by students in the Villa Médicis were considered was so lax, it has had the effect of causing a great many people to maintain that the Prix de Rome for all arts should be abolished. The worst offenders were unfortunately the architectural students. This year M. PASCAL has prepared a report, and he does not hesitate to express his opinion about the failings of the drawings. His view of the Arch of Titus is said to ill-treat a beautiful sample of architecture; some of the details have neither character nor truth, and the work is suggestive of negligence and "ennui," the perspective looking as if taken from a bad photograph. The church of Sta Maria in Cosmedin is described as unsuited for an artistic study, because the plan is irregular and there is no originality in the details. The drawings of the Baths of Caracalla show that picturesqueness was sought after and the noble composition of the edifice is sacrificed; the elevations are monotonous and without character. It is pointed out in other cases that the regulations about sending drawings have not been fulfilled. The only drawings that satisfy M. PASCAL are those submitted by a first year resident. A student must be quite confident about his future who is different to unfavourable reports from any of the members of the Academy of Fine Arts, for on his return to Paris the young architect who has complied with the regulations to the letter may rely on obtaining an appointment on some public works which will help him until he is able to secure commissions.

ONE of the paintings in the section of the Pinakothek in Munich devoted to German art is a *Nativity* by ALBERT DÜRER, which was executed for the Town Council of Nuremberg. It is a triptych, and on the right and left are knightly figures that by some are held to represent saints and by others merely portraits of the donors. It has been maintained that after the work came into the possession of MAXIMILIAN I. the landscape background and the horses were introduced by another hand. A few years ago two paintings dated 1550 were found with a future dealer, and they were assumed to be copies of the original wings by DÜRER. If the wings attached to the *Nativity* had been removed and the copies substituted, the change might find opponents, but would be certain of connoisseurs' approval. Instead of that course, it was decided to transform the two wings into a state that, while differing from the copies, was assumed to correspond to the work as it left DÜRER'S hand. This heroic operation has been accomplished. The two soldiers have become St. EUSTACHE and St. GEORGE. The landscapes and horses have been cleared away, and it is needless to say the work has now become altogether different in character from that which was so long familiar to visitors. Any German critics have condemned the transformation; they should remember that in principle it corresponds to the havoc perpetrated in German and French buildings under the guise of restoration.

THERE was a time when farm buildings in Ireland were a source of amazement to all visitors who were agriculturists. Few landlords cared to erect or improve the structures, and it was stated before the Duke of RICHMOND'S Commission that such a being as an estate carpenter, who could help in an emergency, was unknown in Ireland. Building work performed by a tenant was looked on as means to have his rent raised, and to increase the number of people who were covetous of the occupancy of his hold. There is an improvement in the law of tenure, and consequently it is now easy to borrow money on most favourable conditions for the erection of farm buildings. As Ireland is governed by several public departments, and having its traditional rules, it occasionally happens that a great deal of variance arises in the manner of

realising the intentions of Parliament. For example, tenants can purchase their farms at equitable sums, but in the calculations the value of the farm buildings is ignored. No doubt with the tumbledown cabins of old days it would be difficult to fix a price, but the matter is different when they are modern and constructed by public money granted on the understanding that it was to be repaid. A few days ago a case came before the Land Judge's Court which exemplifies the strange practice adopted. It was arranged that a farm, for which the rent was 100*l.* a year, was to be sold for 1,700*l.*, or seventeen years' purchase. On the land were buildings lately erected by the Board of Works, of which the estimated value was 500*l.* But in the calculations not one penny was allowed for them. The reason is that the Land Commission who grant the purchase money do not consider farm buildings as security for repayment of the money. The Board of Works, no doubt, can claim repayment from the landlord, and when property is sold under the new conditions the farm buildings will be made over to the tenant gratuitously. In the case in question the judge refused to be a party to the transaction, and he said that unless a sum of 2,000*l.* was paid by the tenant he would have the property thrown on the market.

THE French Government have obtained the approval of the Chamber for an outlay of 3,000,000 francs in order to execute the works most urgently required in Martinique. M. KNIGHT, as the representative senator, has demanded that the sum should be raised to 7,000,000 francs. He considers that it will be necessary to reconstruct at once several of the buildings which disappeared in the recent catastrophe, and especially the primary and secondary schools. The suggestion testifies to the importance which secular education has acquired in the minds of Frenchmen. Unfortunately the financial condition of France will not allow of so large an outlay on the colony of Martinique. It may therefore be taken for granted that rebuilding can only be gradual and that inconvenience will be suffered during several years.

MUCH disappointment will be caused by the decision of the Court of Appeal in the case *WRIGHT v. BERRY*. When an injunction was applied for by the plaintiff in March we suggested the character of the grievance which arose by saying that "ninety-nine out of every hundred people would object if they found that a hospital, or refuge, or benevolent institution were set up opposite their dwelling-houses, and more especially if they were not able to abandon them without suffering loss." The plaintiff was the purchaser of four of the "large choice plots for the erection of private residences" which were sold as part of the St. Kilda estate in Ealing. It was stipulated that "no building of any kind other than a detached or semi-detached house with appropriate offices and outbuildings to be appurtenant thereto or occupied therewith shall be erected on any plot." The defendants bought two plots, on which it was intended to build self-contained living-rooms to accommodate fourteen families. Application was made to Mr. Justice BYRNE for an injunction to prevent the construction of those cottage homes for the aged poor. But his Lordship held that although in the particulars of sale there was a distinction between residential plots and shop plots, there was no distinction between residential plots and private residential plots. The injunction was, therefore, not granted. What we remarked at the time was, "The only remedy is either to have stringent building regulations which cannot be broken, unless under a penalty, or for a purchaser to buy neighbouring plots which might be used to his disadvantage and to resell them." The Court of Appeal, consisting of the Master of the Rolls, Lord Justice ROMER and Lord Justice COZENS-HARDY, have agreed with Mr. Justice BYRNE. It will, therefore, be well for purchasers of building plots to take warning from the case. Unless there is a stipulation that the plots are to be used only as "private residential plots," there is a risk that what purchasers at least consider to be the spirit of the arrangement may be departed from with impunity.

NEREIDS WITH TRITONS BEARING SYMBOLS OF VENUS, NEPTUNE, BACCHUS AND APOLLO.

MOORLAND WATERS AND LEAD PIPES.

THEORISTS, who are inimical to the interference of Government with ordinary life have to admit that cases arise in which the organisation of a public department is best adapted to attain the ends desired. JOHN STUART MILL, for example, points out that while the greatest things have generally been done by men who had the least time at their disposal, there were investigations and experiments which required not only a long but a continuous devotion of time and attention, and for them the community collectively should bear the expense. It is satisfactory to find that some of the Government departments are of late undertaking investigations which no individual could unaided bring to a conclusion. The report to the Home Office on the ventilation of factories and workshops is one instance of what can be done. A second, and one which is more remarkable, is the report on lead poisoning and water supplies which has been prepared on the initiative of the Local Government Board.

The general employment of lead in plumbing is an English peculiarity. The material has many advantages for that purpose. Occasionally, when there are panics about lead-poisoning, the good qualities are temporarily overlooked. It should be understood that all kinds of water do not corrode lead. Where there are certain salts, chlorides or nitrates, the pipes will suffer. But when there is carbonate of lime in the water, the metal, instead of being dissolved, is protected. In the cases of salts or acids, it is also possible to neutralise the effects without any diminution of the potableness of the water. In a great many places no other source of supply is available than one which will affect pipes, and it is well to be able to know on the highest authority what is the extent of the risk incurred. That is the purpose of the investigation by Dr. HOUSTON, which was ordered by the Local Government Board.

A great many towns, including Leeds, Huddersfield, Bradford, Sheffield, Wakefield, Preston, Oldham, Halifax, Bolton, Blackburn, &c., derive their supply from moorland gathering-grounds in Lancashire and Yorkshire. Now, as moorland waters from being acid have the power to dissolve the lead of water pipes, whether new or old, they become a potential source of danger. There is in the first place the acidity of the water, and in the second place the bacterial influence which sometimes causes erosion. It is advantageous to comprehend the extent of the power of the two factors, and that has been done by Dr. HOUSTON with an elaborateness that is enough to suggest the accuracy of his data and the cogency of his conclusions. The details are set forth not merely in a great many tables, but by a series of about fifty large diagrams which at once appeal to the eye. There are also in the volume copies of the Ordnance maps showing the reservoirs and gathering-grounds referred to in the report. Everything is presented in the most circumstantial manner, and, in fact, it would be impossible to collect and adapt information with equal completeness through the agency of private enterprise.

We need not premise that the inconvenience of the presence of lead has been known for several years. Professor CLARK, whose name will always be associated with the overcoming of hardness and other defects in water, sixty years ago was employed to investigate the quality

of a supply derived from Bagshot Heath, which had poisoned some of Queen VICTORIA'S hounds and caused suffering to the huntsmen. In the course of a few days he was able to ascertain that nothing more than filtration was necessary in order to eliminate the lead. At the present time it is believed that in dealing with similar water "perhaps the most satisfactory method is ordinary sand filtration, with the addition of some neutralising material (e.g. a thin coating of lime on the surface of the sand with limestone underneath the sand) to the filter, and the subsequent addition of a trace of sodium carbonate to the neutralised water."

The Bentham reservoir at Burnmoor in the West Riding of Yorkshire was made the subject of a differential examination over a prolonged period by Dr. HOUSTON. It had acquired a reputation for an extreme degree of acidity which acted vigorously on lead. Many cases of lead poisoning were mentioned as occurring in the district. It was found, however, that some of the water had no power of dissolving lead, but this fact did not excite surprise, for it was ascertained that moorland water is sometimes devoid of plumbic solvent ability. Over two years were spent in the examination. It was known before that moorland waters which cause lead poisoning are apt to be acid, but the new investigations establish the extent to which the acidity itself was the essential factor in producing plumbic solvent. The laboratory experiments demonstrated conclusively "that an acid peaty water may be deprived of its acidity and plumbic-solvency by admixture with a sufficient quantity of neutral water. Moorland spring water possessed of acid neutralising ability. Given a continuance of favourable counterbalancing conditions, a mixed water which constantly receives a proportion of highly acid water may nevertheless remain with the ability to act upon lead."

The bacteriological examinations were very remarkable. About a dozen varieties of micro-organisms were isolated and identified from the peat soil, besides a large number not identified. Some more were obtained from cultivation of peat water. The experiments testified that the bacteria were the agents in the production of acid in peat. Sometimes a mixture of peat bacteria when grown in neutral sterile decoction made solely from peat rendered the liquid acid and plumbic-solvent. With certain species in cultivation the decoction remained neutral and was without action on lead. But "the net result of the experiments thus been to afford presumptive evidence of the strong kind that the antecedent cause of the acidity and plumbic solvent ability of a moorland water is the vital activity of particular species of bacteria in moist peat soil."

It is very remarkable that although moorland water may be acid, the water from moorland springs is only neutral and wanting in plumbic-solvent power, and possesses acid neutralising ability, which annuls, or at least lessens plumbic-solvency. A water which otherwise might be dangerous can thus become free from risk of lead poisoning. It is remarked that waterworks officials in the past have not taken sufficient notice of the advantages which come through the mixture of spring water. But they are likely to be more attentive after the Government investigations.

The laboratory experiments showed that when an acid peaty water fully filled stoppered bottles, the acidity

very slightly reduced in amount, but in unstoppered and partially filled bottles there was a distinct loss of acidity. The following conclusions about reservoirs were consequently arrived at:—"The greater the capacity of the reservoirs the more complete is the sedimentation of the water likely to be, and the less likely is the water sent into consumption to show the results of the entrance of storm water. Moreover, the greater the capacity of the storage reservoirs the longer the delay will be between the primary collection of the water and its final transmission to the consumers. But it must be remembered that the bed of some of these reservoirs is composed of peat, and that such peaty matters are washed into the reservoirs with every storm. In consequence, although there may be a loss of acidity due to long exposure of the water to the action of the air, there may also be a gain in acidity due to fermentative changes in the bed of the reservoirs. . . . When the enormous capacity of some of these reservoirs is considered in relation to the fact of observed acidity in the water contained in them, the importance of observations at this point is evident. A large reservoir might permit the storage for subsequent consumption of hundreds of millions of gallons of acid water, and water, moreover, capable of dissolving lead to a dangerous extent."

Fortunately, moorland waters are easily improved by chemical action. The water supply to Wakefield is strongly acid. But 500 gallons of a strong solution of soda, of about a pound per gallon, are mixed with a million gallons of acid water. The resultant no longer acts on lead, and is deprived of its erosive power. The only drawback is that the water is not clear. At Barnsley there is filtering through layers of sand, gritstone and limestone. In Wakefield, about two grains of lime per gallon are mixed in an apparatus with the water, which is then conveyed through several miles of channel to a service reservoir. Lime is always used at Rochdale, a grain to the gallon in old works, while in the new works the water is filtered through sand, and enough whitening is added to the water to filter beds to cover the sand with a thin coating of lime. Filtration is employed at Keighley; first, through lime, then through filter beds containing fine sandstone, and sandstone, broken sandstone and limestone, and finally through beds of polarite.

The conclusions inspire confidence. Any epidemic of lead poisoning which occurred in the North of England is mainly due to the use of untreated acid peaty water. Wakefield, for example, has a high and low-level supply. The people suffered who used high-level water until it was treated with lime, and then there was an end to lead poisoning. A similar experience was to be witnessed in Leeds. It is evident that moorland water varies in acidity, and care is therefore essential to have constant tests to determine whether there is a rise or fall in plumbous content. When projects for waterworks are brought forward it is usual to have samples tested by chemists. Owing to the variations which arise in water it would be better if the samples could be obtained at different times, especially when there were atmospheric disturbances likely to affect the gathering-ground.

MODERN SCHOOL BUILDINGS.*

No class of English buildings has improvement been more marked than in schools. From the older examples which have survived it is evident there was not much division among the pupils. Originally the school was a large room or hall; then in course of time a separation was made by the hanging of a curtain, which from its flimsiness or insecurity could easily be pulled down, and consequently severe punishment was inflicted on any scholar who meddled with it. We have from the pen of QUINCEY an account of the Manchester Grammar School, in which he became a pupil in 1800, that will best suggest the character of high-class schools of the period. The walls, which, as he said, might have been embellished

with plaster-of-Paris friezes or medallions, were as bare as those of a poor-house or lazaretto. There was not even the smallest playground attached to the school. Moreover, a lower school existed to which access was given by long flights of steps, so that reading and writing must have been taught at a considerable depth below the street level. In those days, and, in fact, during the greater part of the nineteenth century, the teacher was supposed to be the only needed force in a school, and it mattered little whether he gave instruction in the open air or in a subterranean chamber, as in Manchester. PESTALOZZI carried the system still further, for he dispensed with books. All the instructions were derived from the lectures of the master.

In a modern English school it is realised that the efficiency of the system is, to a large extent, secured by the mere arrangement of the buildings. The office of the teacher is not undervalued, but he is able to secure more satisfactory results when the planning enables him to have a classification of the students. Under the existing conditions, a school resembles a factory, and in one as in the other, it is found that expedition and successful production are aided by having the material to be operated on in its different stages kept together, so that there may be no confusion.

The progress which is now being sought is suggested by the order adopted in Mr. FELIX CLAY'S treatise. In it buildings for secondary education take precedence of those for elementary education. The days of the three R's are over, and at the present time secondary education is receiving unusual attention. It may even be doubted, whether the Bill of last year would have passed if it were not for the belief that the machinery which existed in England for teaching was not adapted for secondary education. Mr. CLAY has reason on his side when he says, "It is more desirable that the methods of secondary school buildings should find their way into the elementary schools than that those of the elementary school should be adopted in the higher schools, as has hitherto been too much the case."

In the old days an educational course, owing to its simplicity, could be defined without difficulty. At most the school was only a place of preparation for one of the universities. It was thought to denote extraordinary liberalism on the part of the Court of Chancery when the sum of 60*l.* a year was authorised to be applied for payment of a master to teach writing and arithmetic at Monmouth. The law was supposed to be strained by LYNTHURST, although judges professed to be glad of a precedent to show that such subjects as writing and arithmetic were not to be ignored. In our time science is dominant, and a secondary school is expected to possess a chemical laboratory, a physical laboratory, a balance-room, a dark room for optical experiments, a room for botany, biology and microscope work, a museum, studio, library for pupils, &c. (see page 6*r.*). Then there are classrooms, and, calculating fifty of our leading schools, there is an average of rather under sixteen boys to a master, exclusive of music masters:—"This cannot, however, be taken as a fair index to the size of the classes, as all the masters would not be teaching at one time. It is generally agreed that one teacher cannot properly manage and regularly teach a larger number than 30, though there should be one or more rooms capable of accommodating 40 or more, and there may well be some of a smaller size; but generally speaking, a class of from 25 to 30 may be considered about a standard size." That so much definite information with regard to secondary schools is presented in Mr. CLAY'S volume is evidence of the efforts lately made to supply a public want. It should be remembered that as late as 1898 a report of the Education Department announced that it was impossible even to state the number of schools which could be considered as secondary, for "the whole subject is exceedingly obscure, and has never been brought within the scope of comprehensive statistical inquiry."

Among the secondary day schools described and illustrated in Mr. CLAY'S volume are Colet House School, Bedford Grammar School, High School for Girls, Streatham Hill; High School, Blackburn; Dewsbury Grammar School, High School for Girls, Sheffield; Aske's School for Girls, Hatcham; Coborn School for Girls, Hulme Grammar School,

Modern School Buildings, Elementary and Secondary. A treatise on the Planning, Arrangement and Fitting of Day and Evening Schools. By Felix Clay, B.A. (London: B. T. Batsford.)

Hymer's College, Hull; Wimbledon High School, Stamford Hill High School, St. Paul's School, West Kensington; Mercers' School, Barnard's Inn; High School, Newcastle; High School, Birmingham; High School, Manchester; Judd Commercial School. There are also examples of schools with separate boarding-houses, training colleges, &c. On the subject of cost Mr. CLAY writes:—

A secondary day school can, by the exercise of the strictest economy and by limiting the accommodation to the barest essentials, be built for between 25*l.* and 30*l.* a head; while a quite satisfactory building can be secured by spending from 45*l.* to 50*l.* A pupil-teachers' centre now in process of erection in the Marylebone division is being carried out by the London School Board at an estimated cost of 20,993*l.* The building consists of eight classrooms with an accommodation for 325, which means a cost of about 65*l.* per head. This building would make an excellent plan for a secondary day school, and it is interesting to compare it with the plan of the Newcastle High School, which has about the same accommodation and cost under 9,000*l.* This last was built by a private company, and provides ample accommodation for the number in a handsome building. The high schools in America, which are large and very elaborate buildings, very fully equipped and often allowing over 20 square feet per head, cost from 90*l.* to 130*l.* per head. The cost of boarding-schools may rise to a very large figure; anything from 200*l.* to 600*l.* a head may be required if many additional buildings are to be supplied, such as swimming-baths, gymnasium, &c., and large playing-fields, &c. The buildings for poor law schools vary from 100*l.* to 200*l.* a head. The cottage homes (Hornchurch) were certified by the Local Government Board for 337 children, and an outlay of 51,000*l.* authorised, or a little over 150*l.* a head. The London School Board have recently worked out a scheme for dealing with deaf children by building a special residential building. The one proposed is at Anerley, and will accommodate sixty children in two blocks of semi-detached cottages. The accepted estimate for this is 19,000*l.* This seems rather a large outlay, coming to over 300*l.* a head, though, of course, the price must be greater when dealing with small numbers and those of a special class.

Modern architectural history is so quickly forgotten, it may not be generally known that up to 1872 a central hall was unknown in London schools. That feature was first introduced by Professor ROGER SMITH in the Ben Jonson school at Stepney. Mr. CLAY states that two years afterwards Mr. ROBSON, in his book on school architecture, held, "that the plan of this building was unsuitable for an elementary school, chiefly on the grounds of its great size, saying that the gathering of a large aggregation of children into one building was condemned by the experience of all Europe; secondly, on the comparative uselessness of the hall; and thirdly, on the great expense involved in such a class division." The London School Board believed the innovation was unsuitable, but in the course of a few years it was again adopted. Examples of schools are given from London, Manchester, Birmingham, Edinburgh, Glasgow, besides others, for the sake of comparison, in Germany and America. Altogether eighty-five schools are illustrated. So many types will be invaluable for architects, not only for their suggestiveness, but in saving trouble in the preparation of preliminary sketches. At the present moment there is some uncertainty about what may be desired by the new authorities, but as the Education Board will continue to be supreme their code of requirements will remain as influential as ever. In any case, the possessor of "Modern School Buildings" has at his disposition plans of the best schools erected during the past thirty years, and it is unlikely that any want will arise for which there is no example of the way to meet it introduced into the pages of Mr. CLAY'S book.

The Commissioners appointed to investigate the subject of a proposed eastern harbour and docks at Gibraltar have decided in favour of the project. The estimated cost is 6,000,000*l.*, and the work would require ten years to execute.

Workmen, while laying a sewer opposite two houses in Brighton, discovered a large well about 5 feet 6 inches from the crown of the road. On investigation it was ascertained that the depth was 140 feet to a wooden stage, so the actual depth is likely to remain a mystery. The circumference was 10 feet 6 inches. The top of the well was brick-steined, with a "W" stamped upon the frog of the bricks.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VI. (continued).

THE feeling for symbolic or appropriate relief (and other) decoration is becoming intensified, and should receive the warmest encouragement. Such ornament is a powerful factor in differentiating the purport of various buildings, and serves to import pleasing variety into our streets, wherein mere varied treatment of sky-line is apt to

be unsuccessful. Cutlers' Hall has a character frieze, so also has Messrs. HEATH's establishment (the "Hatteries") in Oxford Street—to mention two metropolitan examples; and another London building worthy of notice is the Central Technical Institution at South Kensington (fig. 39). The panels on the façade, showing the arms of the subscribing City Guilds, are excellent as a feature of decoration. The alternative methods of decorating a façade are very numerous, but range themselves into three distinct classes, which it may be well to tabulate:—

Inset Decoration.	Surface Treatment.	Relief.
1. Incisions in materials. a. Brick. b. Stone. c. Sgraffito. d. Stucco. e. Wood.	1. Parti-coloured treatment of materials. 2. Painting. 3. Stencilling. 4. Combination of materials. 5. Marble (&c.) lining. 6. Flush half-timber. 7. Flint tracery.	1. Moulded ornament. 2. Carved ornament. 3. Cast ornament. 4. Sculpture. a. Bas-relief. b. Mezzo-relief. c. High relief. d. Statuary. 5. Tile hanging. 6. Pargetting.
2. Half-timber work.		
3. Recessed portions of façade.		
4. Niches.		

It is unnecessary to schedule the varieties of chiselled ornament, as this is more appropriate to a treatise on the subject, but special attention may be directed to sgraffito work. This is produced by the successive laying of differently coloured coats of stucco—as many coats as there are to be colours in the design, which is worked by cutting down the pattern at each stage to such a depth as will show the desired colour. A specimen of sgraffito may be seen in the courtyard of the Victoria and Albert Museum, London, at the entrance to the schools, the east wall of the building under the archway being thus decorated.

FIG. 40.—INSET, OR SUNK BAY WINDOW.
N.B.—SUNK INTO THE ROOM.

Some buildings of recent erection exhibit a treatment of inset decoration that has much to commend it on the score both of novelty and effect. This is obtained by recessing a portion of the façade and therefrom projecting, say, a bay window flush with the original wall surface. This treatment will bear development (see figs. 40 and 41). Another device

FIG. 41.—RECESSED FRONT TO A BANK IN BRADFORD.
J. Ledingham, Architect.

is as shown in fig. 42. This also can be made very effective, more especially if the bay is set in a thick wall. The principal difference between this and the former treatment is that in fig. 40 the recessed portion is

FIG. 42.—INSET BAY WINDOW, SUNK IN THICKNESS OF WALL ONLY.

set into the room, and is carried through one storey or more in height, whereas in the latter the treatment is applied to individual windows set in the thickness of the wall. There is not the slightest reason why the mode of treatment should not be developed on catholic lines, so as to give the effect of framed pictorial decoration.

Regarding surface ornamentation, the simplest method is the use of a parti-coloured brick or stone (or brick and stone) façade, producing, if skilfully managed, a pleasing and varied effect. In the metropolitan area, to go no further, a stock-brick elevation in monotone is very depressing. General consent has given to the adjective *monotonous* (i.e. one-toned) the connotation of unsatisfying sameness. Harmony and monotony have only a step relationship—the former is produced by the sympathetic blending of variant notes, each of which singly emits but a monotone. If, say, the keynote on a pianoforte be struck repetitively for only five minutes, the monotony would be distracting, whilst the National Anthem could be listened to in the same duration of time with great enjoyment.

Speculative builders are to the fore in recognising the necessity of variety, even if it consists in nothing more than the interspersing of a few red-brick or stone bands or lacing courses in a yellow stock brick façade, for not infrequently the generous builder introduces Bath stone dressings; he reckons not that the stone is poor in quality, and the carving (as a rule) such as would be condemned in any school of art.

In districts where stone is abundant the process is reversed, for there the small cottage dwellings have the façade relieved by the introduction of bricks for the lacing courses. It is possibly due to the fact that natural products are of a higher order than manufactured, but there is not a shadow of doubt that the stone dwellings, similar to those that may be seen in a town like Cardiff, are free from the deadly dullness that is an integral feature of so many of the metropolitan buildings.

Another point to be noted in this connection is that rubble masonry is freer from this same dullness than is ashlar masonry, and the latter again is in degree more lively, the more varied the surface of the stone. The majority of the buildings in Bath, for example, are very depressing in effect, though in the height of this town's prosperity, the monotonous treatment of the façades must have proved a suitable background for the gay plumage of the floating population.

It is worth calling attention to the constant pleasure afforded to the eye by the green hedges that border the fields, as seen during the progress of a long railway journey. When these quickset hedges give place in a stone district to stone fencing, the change is for a time interesting; but soon the traveller tires of its monotony, and welcomes the green hedges again, whose varied tones and tints not only banish but preclude a feeling of satiety, although, of course, the dominant colour will be green.

If the previous remarks are somewhat protracted, it is with the intention of emphasising the necessity of taking Nature as our guide both in what to follow and what to avoid.

To return to parti-colour decoration of surfaces, more or less elaborate treatment obtains by disposing the coloured blocks so as to form geometrical designs. Sometimes this is excellently managed, but it requires thoughtful treatment.

Half-timber work has been classed above under both inset and surface decoration, according as the whole surface is brought flush or otherwise. That this mode of ornamentation can be most picturesque, innumerable buildings in Cheshire, Shropshire and other counties in England testify. In former times it used to be con-

structional in treatment, but at the present day it is to a much larger extent merely ornamental; and from this point of view it is not of any import whether the half-timber work is constructively true or false—indeed in such a case it is easy to make a fetish of the goddess who resides at the bottom of a well. Quite recently a building has been erected in the metropolis to act as temporary premises, due to the formation of the new avenue from High Holborn to the Strand. The façade shows half-timber and rough-cast treatment—of course it is “sham,” but it satisfies the eye most thoroughly; and for those who value mediæval work, the block of buildings at Holborn Bars is still to be seen. This block was made constructively sound some years since by Mr. ALFRED WATERHOUSE, and is likely to remain as a monument of old English work for many years to come.

Marble wall linings, if deftly handled, exercise a most pleasing influence over surface decoration, but are, as a rule, too expensive for employment. The Junior Constitutional Club, London, by Mr. EDIS, is a notable example.

Glazed façades (whether in brick, tile, or faience) are to be commended for a town atmosphere, as they admit of cleansing, and at the same time are more cheerful in aspect than ordinary brick or stone façades.

Painting and stencilling are less to be recommended for practical purposes, as being more perishable in nature, but are not on that account to be dismissed lightly.

Painting may be classified as (1) plain surface tones, (2) decoration, either geometrical or free; the former will be dismissed without further comment, as not having any bearing on this series. Decorative painting requires a carefully prepared surface to gain the full effect; speaking generally, the most appropriate treatment for external purposes is a restrained application of geometrical design; internally, far greater freedom of choice exists for subjects of decoration.

In dealing with internal painting of this class, the greater play that is given to appropriate treatment, the more pleasing will be the result (the question of economy will be disregarded here). Thus, in a dining-room, a frieze to represent the preparation of a feast, or perhaps a representation of a Bacchanalian procession, may be introduced. In a drawing-room, a music-room, or a ball-room, terpsichorean friezes are in keeping; or if the desire be strong for *ouverture-de-siècle* treatment, a modern “At home” or a reception might prove interesting in representation. For libraries, various scenes and incidents *à propos* would suggest themselves, and similarly for other rooms.

A point to be noted is, where light, shade and cast shadow are used decoratively, the position of existing windows should be taken into account as far as possible; this point will not admit of labouring, however. To give a concrete example, in the matter of a large hall with clerestory windows on all sides, where a painted decorative frieze was required beneath these windows, the writer treated the cast

FIG. 43.—DIAGRAM CONCERNING SHADOWING.

shadows as being thrown downwards and to the left hand in *each* position, disregarding the more remote set of end windows, beneath which the decoration was not desired; the result looks highly natural. Fig. 43 indicates the general disposition of the hall referred to.

It will be of interest at this place to transcribe some remarks made at the time of the controversy regarding the decoration of the Great Exhibition buildings. Mr. E. L. GARBETT is the signatory:—“The only colours (if so we may call them) which will harmonise, or rather be non-discordant with all others, are white, black, and all the neutral tints between them. Moreover, these as well as all the tints or shades of any one definite hue are harmonious, or rather indifferent to each other.

“Accordingly, when we turn to Nature’s exhibitions we find, however the articles exhibited may be coloured, their backgrounds are neutral, or *comparatively* neutral. The purest positive colours belong to the rainbow; the purest neutrality to the clouds that back it. Primary colours are given to the flowers, not to that on which they grow. As we descend or ascend from the house to its inhabitant, from the bearer to the borne, so do we from neutrality to positive colour. The tree is more coloured than the rock or earth whence it springs, the foliage more so than the stems, the blossom or fruit more than all.”

A very pleasing treatment for pictorial decoration is by means of fresco or similar effects. The lunettes by Lord LEIGHTON in the Victoria and Albert Museum* are noteworthy, as also is the series of decorative panels to the Royal Exchange in the City of London, portraying events of ancient or modern interest to the citizens of the metropolis. Being arranged in sequence of time from the early trading with the Phœnicians to the phases of modern commerce (the latter panel is soon to be installed), the series will form when complete—and even does so in its present condition—an educational object-lesson of the highest value, whether from the standpoint of architecture, political and social history, commerce, or dress.

Just as *lettering* may be used as a medium for decorative effect in relief, so also may it be used in pigments, and the following point is of importance—the further removed from the spectator’s eye, the simpler should be the lettering. It is a moot point whether the letters should be edged in a stronger tone or colour than the body-tone, so as to prevent the appearance of “sticking” to the background; the writer prefers where possible to trust to shadowing alone. As an

FIG. 44.—SKETCH OF CAR ON CENTRAL LONDON RAILWAY, SHOWING POSITION OF ADVERTISEMENTS.

instance of the improved condition of the advertiser’s sheet, the following may be noted. The Central London Railway carriages have the coved portions (see fig. 44) adapted for enamelled iron advertisement panels. On advertiser has taken advantage of this to show the thickness of the letters thus, as at A in figs. 44 and 45, and

* For many years known as the South Kensington Museum, London.

so deftly is this effected that the letters, though flat, yet appear solid, and still apparently parallel with the contour of the carriage. It would have been so easy to spoil the effect, that it is evident that thoughtful attention was given to preparing the cartoon. B and L (figs. 44 and 45) show the want of consideration adopted by many advertisers.

FIG. 45.

Relief decoration as introducing the benefits of chiaro-scuro is preferable to mere surface treatment, everything else being equal. The three kinds of relief elsewhere mentioned, as also statuary, have severally their appropriate places and occasions for introduction. In buildings that do not possess a story worthy the telling (and there are plenty such), statuary groups or figure-friezes are entirely out of place; but wheresoever a chance occurs to use such artistic effect, it should be introduced. A building of world-wide repute, the Albert Hall, London, will serve as an illustration of how vain a thing is a designer's art, when all has been said. This has a most notable frieze (but not in relief), illustrative of the various arts and sciences, and it might well be urged that such a frieze is not quite in keeping with a concert hall; but the point to be noted is that this edifice was erected for the purpose of a central establishment for the encouragement of the arts and sciences generally, by holding international exhibitions therein from time to time; its more limited significance is of later growth.

(To be continued.)

THE GEOLOGICAL SOCIETY.

AT the annual meeting of the Geological Society the following officers were elected for the year:—President, Professor Charles Lapworth; vice-presidents, Sir Archibald Geikie, Professor H. A. Miers, Mr. E. T. Newton and Mr. J. J. H. Teall; secretaries, Mr. R. S. Herries and Professor W. W. Watts; foreign secretary, Sir John Evans; treasurer, Mr. W. T. Blanford.

The president (Professor Lapworth), in his presidential address, dealt with the subject of geology and its fellow-sciences, emphasising in particular its economic and educational value. It was, he said, almost an impertinence to point out to an assemblage of geologists like that the relationships of geology and its applications to the material welfare of our fellow-countrymen; but those of them who were absorbed in the charms of research were now and again tempted to look askance at those who were engaged in advancing geology and the applications of geology from the side of economics. But for all that, every one of them was well aware that geology was bound up body and soul with the development of the mineral wealth of our land—that mineral wealth by means of which the enterprise of our people had placed our country at the head of the manufacturing and commercial Powers of the world. Their science had not only the charge of the working out of all the detailed phenomena, subterranean and superficial, of the great coalfields and ironfields which lay at the foundation of our commercial supremacy as a nation, but it worked out the characters and fixed the places of all the stony materials of which our cities and towns were built, our humblest dwellings were constructed and all our roads and railways were made. It dealt with the sources and the quantities and characters of our water supplies, whether deep-seated or superficial, the nature and distribution of our soils, and, indeed, with everything which we derived directly from the ground upon which we trod. Thus a knowledge of the principles and applications of geology was absolutely indispensable to the education of the miner, mine-owner, the prospector, the land agent and landowner, the agriculturist and the civil engineer, whilst a first-hand acquaintance with at least its elements was eminently desirable for the agriculturist, the geographer, the traveller and the biologist. Many might even be willing to admit that the arts-man and the man of culture would be the better for knowing something of its principles and its conclusions. But as geologists it was their bounden duty to go much further than this, and urge upon the educationalists of the day the necessity of affording the rising generation such a full opportunity of instruction in that kind of knowledge of which geology was the keystone.

CULROSS ABBEY.

A SCHEME is afloat having for its object the much-needed restoration of the historic and interesting abbey of Culross, which, having been carefully examined both inside and out, is found to be in a very bad and even alarming state of disrepair. The abbey was founded in 1217, since when it has been the centre of worship for the district. In 1824 certain repairs and alterations were carried out on the building, which not only deprived it of its original beauty and distinctive character by shutting up some of the finest specimens of Norman windows to be found in the country, but by the erection of two ill-designed galleries imposed an unnecessarily heavy task upon the preacher by removing all resonance from the interior. To such a state has the disrepair reached that matters cannot be allowed to go on much longer as they are. Accordingly the advice of Sir Rowand Anderson has been asked, and he has submitted two schemes, the first being merely to put the structure into a good state of repair by re-flooring, reseating and reroofing the building. This will cost a sum of 2,000*l*. As a second and more elaborate scheme, the eminent architect suggests the restoration of the abbey to its ancient historical state, which cannot be done under 5,000*l*. In addition to what is proposed to be done under the first scheme, the adoption of the second will bring about the removal of the objectionable east and south galleries, rebuilding the side aisles, the north and south transepts, restoring the beautiful Norman window on the east, and opening two three-light windows in the north wall. At a recent public meeting in the church the Rev. John Gordon, minister of the second charge, explained that the heritors were prepared to defray the cost of the lesser or absolutely necessary scheme, but he thought that as Glasgow's greatness and fame dated from the visit of St. Mungo, who was born in Culross, he felt that that city ought to help them in raising a fund towards the restoring and beautifying of the abbey church, and he had good reason to expect that the big city would rally to their assistance. The meeting agreed to leave the appointment of a central committee in the hands of the Kirk Session, and it was expected that sub-committees would be formed in Edinburgh and Glasgow for the purpose of collecting subscriptions from many who were well known to be interested in the ancient burgh and its abbey.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE sixth annual dinner of members of the Architectural Association of Ireland was held on the 19th inst., at the Dolphin Hotel, Dublin.

The president, Mr. F. G. Hicks, occupied the chair.

After dinner, the President gave the toast of "The King," which was enthusiastically received.

The President next gave the toast of "The Architectural Association of Ireland." He said they had been established some seven or eight years, and this was their sixth annual dinner. He thought they were doing a rather good work in a quiet way by their meetings and classes. Their membership was increasing every year. They now numbered 150. During the present session they had approached the Royal Institute of Architects of Ireland, with a view to initiating examinations for admission to their body, and the matter was still under consideration. The Institute had taken up the matter favourably, but great bodies moved slowly, and they could not, of course, expect an answer until some further time had elapsed. Still the Association intended to keep hammering away, and if the Institute did not grant their request they would probably hold an examination of their own.

The toast was cordially honoured.

The President next gave the toast of "The Guests," with which he coupled the names of Mr. Purser, president of the Junior Engineering and Scientific Society, and Mr. Crawford Smith.

The toast, which was well received, was acknowledged by both Mr. Purser and Mr. Smith. Mr. Smith said that their President would go down to posterity as the winner of the prize offered by Lord Iveagh for the best design of his projected markets in Francis Street.

During the evening vocal and instrumental items were contributed by several members of the company.

A Magnificent piece of Gobelines tapestry has just been designed specially for the Elysée. M. Hannotin, the eminent architect and decorator, is the artist. Round a centre of warm red colour is a border of yellow chrysanthemums and red carnations intertwined, this again being enclosed in another border of red carnations and pale green plane-tree leaves, while the whole is closed in by a border of red humming-birds. The dimensions of the carpet are 15 feet 2 inches by 11 feet 5 inches. Two years will be needed for the manufacture.

NOTES AND COMMENTS.

AN exhibition has been opened in Paris consisting entirely of works produced by employés on railways. On Friday next there will be another exhibition, which is to be devoted to artists engaged in the Post Office or in connection with telegraphs and telephones. Some of the contributors are students of the Ecole des Beaux-Arts, while others receive instruction in the ateliers of some of the foremost painters and sculptors of Paris. To Frenchmen the exhibitions will not appear extraordinary. Most littérateurs endeavour to secure appointments in public offices, for the risks of depending entirely on the income obtainable as a man of letters are too great to be borne. It is now found that only in exceptional cases can a painter or sculptor expect to have his first works purchased at what he reckons to be their proper value. While in a state of anxiety about his present and future prospects, a young artist is not likely to do himself justice, and it is deemed preferable to sort letters or to work a telegraphic instrument than to produce pot-boilers of a kind which are afterwards likely to be regretted.

AMERICAN artists have repeatedly expressed their disapproval of the import duties on works of art. Originally they were levied partly to increase the revenue and partly to promote native production. It is now found there are drawbacks. Excellent works of art which would be boons for American painters and sculptors are kept out of the country, and, moreover, the tax can be evaded by foreign artists visiting America. Some French painters especially have reason to be grateful, for since the duties were imposed commissions for works to be executed in the States can be relied on with as much if not more certainty as commissions from their countrymen. It is now proposed to introduce a Bill in the House of Representatives for amending existing enactments by allowing the following classes of works to be admitted free from duty:—Paintings in oil or water-colour, statuary, sculpture, drawings, engravings and etchings; provided, however, that such articles in order to become entitled to entry free of duty shall have been manufactured or produced more than fifty years before the date of importation, but said exemptions shall be subject to such reasonable regulations as to proofs of the antiquity of said articles as the Secretary of the Treasury may prescribe. It will be observed the amendment sought is limited, for it refers mainly to works which may be considered as "old masters."

THE works which were to be seen in the Holland Gallery confirm what we have said already about M. RAFFAELLI'S discovery of solid oil-colours. It is a mistake to compare them with pictures painted in oils in the common way, or with pastels or with water-colours. There is a new material, and if rightly used it is likely to lead to a new variety of painting. There is lost the peculiar texture which is imparted by the brush, and which seems to be attainable by no other tool. Again, it should be remembered that the artists who employ the new colours are to some extent in a difficulty. They have their peculiar styles, which they are endeavouring to express under novel conditions. Some men who are adepts in oil-painting fail when they attempt to use water-colours, and *vice versa*. What is to be desired is that the painters would recognise the new opportunities and utilise them to attain effects which are suited to the solid colours, and not necessarily the effects they have been accustomed to realise. M. RAFFAELLI'S own works and M. THAULOW'S are successful. But M. BESNARD shows himself to be more of the experimentalist. English artists are too conservative to attempt changes, and Mr. TUKE, Mr. EAST and others present pictures which are reminiscent of some we have already seen. In course of time we may expect that somebody will arise who will make M. RAFFAELLI'S discovery subservient to his talent. As to the durability of the new paints there is a great deal of amusing absurdity in raising the question. Very few English paintings can resist the indirect influences of the atmosphere in galleries or rooms. Chemically the new paints are not unlike those in use, and there is no reason why they should be more fleeting.

ACCORDING to VASARI, the Roman painter, PIETRO CAVALLINI, was the disciple of GIOTTO and worked with him at the famous mosaic, *The Navicella*, in St. Peter's. It is also said that he executed many frescoes in the church of Santa Cecilia in Trastevere. The frescoes in the church were supposed to be annihilated, with the exception of some fragments. But recently a *Last Judgment* by the old master has been revealed. It proves that he was still under the influence of Byzantine art as well as of GIOTTO. But he was not content with adhering to the traditions that were paramount. Evidently he had studied Roman statues and busts. This is seen in the character of the heads as well as in the draperies. The figures of apostles and saints are no mere onlookers, as in the majority of such representations, but are suggestive of members of a Roman senate engaged in solemn deliberation on some important affair. The antique spirit is further emphasised by the eagle adorning the throne of the Judge. The painting will revive an interest in CAVALLINI, of whom VASARI speaks in the highest terms both as an artist and a man.

THE competition for façades in Paris excites greater interest every year. At first it was judged to be a success if about thirty buildings were submitted in competition. In that for houses erected in 1902, which is now being arranged, nearly one hundred examples have been brought forward. This expansion is enough to show that success has brought solid advantages, for although architects might desire the contest as a means of displaying skill, proprietors would hardly care unless they knew that an increase of value was one of the consequences of a distinguished position in the return of the judges. It is also found that architecture allowed a more free hand in expenditure. No doubt it is possible sometimes to combine economy with invention, but in the streets of Paris it is difficult to depart from the normal type without the introduction of cost features.

If the Irish people had a genuine interest in the Hill of Tara, they would have purchased the tenant's interest in the most important part of it, which was lately sold by auction. A very small contribution from each "patriot" would be sufficient. By that means such insensate attempts as the digging for the Ark of the Covenant could not be attempted for a great many years. The landlord still retains his interest in the property, but he cannot prevent excavations which are approved by whoever holds the land as a tenant. The mounds on the Hill are still present within the operation of the Ancient Monuments Act of 1882, to this extent, that the Commissioners of Public Works have power to proceed against any person, other than the owner, who injures or defaces them. But the earthworks which are protected in that way are of no great importance except to confute those who imagine an architectural structure existed there. It is still possible to do irreparable injury by explorations which, although they are a mockery of archaeological research, are sure to meet with the approval of many zealots. The guardianship of the mounds should be vested in the Commissioners of Public Works. The owner has declined to take this step, and there is no power to compel him to do so. The Commissioners are doing their best under the circumstances by watching the Hill very closely, and will use every means in their power to prevent any resumption of excavation. But unfortunately, the people's interest in Tara and its "Halls" is only one of the rhetorical kind, which would be rendered more vigorous by repetitions of vandalism.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr H. T. Hare (president) in the chair.

On the motion of the President, a vote of condolence and sympathy with the relatives of the late Mr. F. C. Penrose was passed.

The following were elected as members:—Messrs. W. Hart Gregson, G. P. Bankart, C. L. Wright and C. F. Cargill. Mr. S. SPARROW read a paper entitled

The Stained Glass of the Future.

This title has been adopted in imitation of Richard Wagner's "Art-work of the Future." That, which was scoffed at as an idle dream and parodied as "The Music of the Future," has become a present actuality. May the omen be propitious.

There is scarcely any subject about which more ignorance prevails than in stained glass. Quite a number of people still think that the glass-stainer paints the colours on the window. I am not sure whether the idea still survives that a window is leaded up before it is put in the kiln. Even among architects, how few there are who can tell one material from another, the good from the bad, or who know which is the best for a particular purpose. One of my objects, therefore, is to place you in a position to judge for yourselves whether the best material has been given to you, and if the best use has been made of it not only with the view of enhancing the beauty of your own works but also to protect your clients, who doubtless rely upon you to see that they are not palmed off with shoddy or base metal.

I will preface the few thoughts which it is my privilege to offer you with the sweeping assertion that no one has any right to speak about stained glass who has not worked in the best material. When I have reached the end, you will probably grasp the point of view from which I make this assertion. For the present, suffice it to say that the critic can only deal with what he knows; therefore, in judging a window he can only compare it with other windows, either ancient or modern. He can never say, like the worker in the best material, that this subject should have been treated in such a manner to produce such and such a tone, or that this or that part would have been better if such and such a material had been employed. In a word, he can never look into the future and say what ought to be. The very title of this address would seem to disclose a certain dissatisfaction with stained glass as it is. It will therefore be our first task to find the cause of our dissatisfaction; to diagnose the disease, in fact, before we talk of remedies.

Imitation is the disease. And why is imitation the disease? Because it has been said, and repeated on all sides, "There is no glass like the old glass, and there will never be any windows like the old windows." Both these assertions I deny, since they are based on ignorance of the best material procurable to-day, and of the use that might be made of it. Take, first of all, the effect of those assertions on the producer of stained glass. He has been content to imitate a cheap period, viz. Perpendicular, or fifteenth-century work, and imitations of that imitation. When I say a cheap period, I mean as regards the material. It is well known that from the thirteenth to the fifteenth and sixteenth centuries the material deteriorated, becoming thinner and poorer in quality and colour. Whether this decline, which was concurrent with a natural development in the technique of painting, was due to a demand of the painters for a material that would better display their painting, cannot now be known. I am inclined to think it was, but it is not a fact of much importance. If so, it simply proves that they had lost the idea of the essential qualities of a stained-glass window—that it must look like glass and give tone. They had chosen the wrong material for the display of their painting powers. I must protest against glass being used as a material for excessive painting. If you must paint, paint on wood, on canvas, on wall; but leave to glass its essential qualities of brilliance and translucency. If, therefore, one would make a passable imitation of that period, one would have to ignore the best and most expensive glass made now, and use the cheapest and worst. Why that period should have been chosen for imitation rather than another I cannot imagine, unless it be on account of its comparatively cheap production—where so much of a window is given up to canopy and base in whites, which do not require, or at least do not receive, much thought; where the whites of the drapery and of the flesh run into the canopy and base (being usually cut out of the same tint), and the little bit of rich colour in the drapery, rich only by contrast with the white, stands absolutely alone, a shapeless mass. We will give these people the benefit of the doubt, and admit that this period is said to be that in which the highest point in the technique of painting on glass was reached. It is fortunate for them that it is also the period of the poorest glass, if we except the frightful colours of a generation or two ago. One shudders to think what their fate would have been if the style of their choice had been the most expensive to reproduce. Would there have been as many imitators?

Another plea that will doubtless be put forward by the

imitators is that if you have to put windows in a thirteenth or fifteenth-century church you must imitate the glass of those periods. But the very existence of different styles, almost coincident with the centuries, so that we speak of a thirteenth, a fourteenth or a fifteenth-century style, proves that the old men did not imitate their predecessors. There is another theory, that the old men adapted their glass to the varying styles of architecture. It may be that architects of the fifteenth and sixteenth centuries called for a lighter glass, which would show up the more elaborate carvings they indulged in. Those who hold this theory may say that the glass-stainer of to-day should adapt his glass to the architectural style of the nineteenth century. But is there a nineteenth-century style? Perhaps I am treading on delicate ground, and had better leave you, architects to settle the question amongst yourselves. The imitators, however, by no means rigidly follow their own rule; for instance, the imitators of Perpendicular can rarely do anything else but put it, with little or no variation, into every style of church. Let us leave the question of why the early glass-stainers did this or that, and assume that if they were, alive to-day they would have sufficient honesty to use the best material and sufficient talent to make the best use of it.

What, then, is to be our own course with regard to this crucial point? This is the fundamental and unalterable guide for our conduct:—One has no right to put bad glass into a window under any pretext whatever. I have already pointed out that to imitate one would have to ignore the best glass. The highest qualities of a stained-glass window are mystery and rich and appropriate colour in harmony with the subject. Do not tell me, therefore, that an imitation fifteenth-century window is appropriate when it lacks mystery and richness of colour. If a window is full of mystery and devotional feeling, a living symbolism, rich and harmonious colour, a simple and dignified design, strengthened by a bold use of the lead and an expressive tracery and painting, it is worthy to be placed in any church that was ever built.

Before describing the process of making a stained-glass window, by which you will be enabled to know what to look for in a window, and thus to protect yourselves at all points, I must attempt to give you some idea of what I have called the best material. The best material is undoubtedly Prior's "Early-English" glass or Powell's "Antique." "Early English" is a comparatively recent invention, having been in existence only some few years. One would gather from its name that it is an attempt to restore the old English glass; but in my opinion in the quality of brilliance, in its variety and richness of colour, this far surpasses its original, and I have no hesitation in saying that this is the finest glass that has ever been made for our purpose. There are three sorts of coloured glass used in the stained-glass window. Tints which go under the generic term of "whites"; pot-metals, in which the colour goes right through the sheet; and the flashed glasses—that is, the rubies, some blue and other varieties.

The method of manufacture is somewhat like this:—A piece of metal, as the molten glass is called, is taken on the end of a blowpipe, and blown into a square bottle-shape. This contact with the mould gives the glass a certain roughness and inequality, while the inside of the bottle retains a very smooth blown surface. It is this combination which is the characteristic of this kind of glass—brilliance united with body, a faculty of holding the light, while "Antique" is more or less transparent. It also varies considerably in thickness, some pieces being quite half an inch thick or more. All this helps its rich and jewel-like quality. The bottles are then cut at the edges of the sides and bottom, which gives us four sides or slabs 6 inches by 4 inches, and one bottom 4 inches by 4 inches. This is the most general size. Other sizes are 7 inches by 5 inches and 8 inches by 6 inches, the largest. It has been found that this size cannot be exceeded without losing the jewel-like quality of the glass. In flukes or accidents, which are the best things in the manufacture of material for stained glass, it is particularly rich. When the heavier chemicals sink to the bottom of the pot, the last few bottles that are made from it are streaked and varied in colour in a most wonderful and beautiful way. The colour of these bottles may be quite different from those made from the top of the pot. This quality of unexpectedness is most valuable, and a window largely carried out in this material is unique, absolutely inimitable. It must be said, however, that the scale of colour is not exhaustive, and that some of the colours are very crude (although these have their uses occasionally), so that one has to fall back upon Powell's "Antique," by far the best of the so-called "Antique" glass. Although Powell's "Antique" is not so fine as "Early English," it has qualities of its own to which, in the present state of the manufacture of "Early English," it may be regarded as complementary; thus I include it in the term "best material." Although it has not the brilliance and body of "Early English" it has those qualities in a much higher degree than other makes of "Antique," which I need not specify. I should men-

tion that there is an imitation of "Early English" called "Norman," which bears a relation to its original similar to that which the common "Antiques" bear to Powell's, and is cheaper. Let me therefore warn you, when you specify Prior's "Early English," to see that "Norman" is not substituted. When I mention that you can get "Norman" for 3 $\frac{1}{2}$ d per slab, and the lowest price of "Early English" is 6d. per slab, the reason for the substitution is obvious. Broadly speaking, "Early English" has more light, Powell's "Antique" more tone, so that one would use "Early English" for effects of light and brilliant objects, and Powell's "Antique" for the parts requiring tone, which is also good to plate a crude piece of "Early English" with, to gain variety of colour and tone.

The process of manufacture in Powell's "Antique" is quite different from the other. It is made in what is called a "muff"—that is, the metal is blown into a cylindrical form (but not into a mould) about 7 inches in diameter and about 13 inches or 14 inches high. It is then cut down the height and placed in a flattening kiln, to come out a flat sheet about 21 inches to 23 inches long. It is in the process of flattening that the glass loses some of its brilliance. In this manufacture there are also gold-pink on Venetian opal, blue on Venetian opal, and gold-pink and blue on Venetian opal. The Venetian effect is a ripple or indentation in the glass, which gives it greater brilliance than the flat "Antique" possesses. The opal is the base, and when a thin skim of blue is flashed upon it it produces a varied cool green tint, with streaks of blue. The gold-pink is a thin skim of gold flashed on the opal base, the warm tone of the opal softening the sharpness of the pink, the colour produced by the gold. The streaks of blue and gold-pink on the opal produce beautiful combinations, often with markings of a feather-like character. This is very good to work away from the gold-pink with. All these are very valuable for special effects. Powell's also make their glass into circles of about 12 inches to 14 inches diameter. These are much richer than the flat sheets, of which they seem to be a concentrated form.

Before leaving the subject of the quality of the material it will be well to devote a little attention to one colour, the most important in a stained-glass window, viz ruby. Indeed, it may be called the touchstone of a window so far as the quality of the material is concerned. There are two metals which produce the red colours we call the rubies, gold and copper. Ruby is one of the flashed glasses, that is, a base of white, amber, green tint, pale blue or purple is flashed over with a thin skim of either of those metals. Gold ruby is confined almost entirely to "Early English," in which it reaches a price calculated to freeze your young blood, and make each particular hair stand on end. You will easily understand that there must be a considerable difference in the cost of these two kinds of ruby; nor will you have much difficulty in guessing which kind is so fondly embraced by the commercial and imitation people. It will be difficult to give you much idea of the enormous difference between the two. Gold ruby is the most distinguished colour, an aristocrat among colours, whereas copper ruby is common and vulgar. Gold ruby is one of the triumphs of Prior's "Early English" glass, in which it provides an infinite variety of rubies, from the richest wine colour to the most delicate and ethereal tints. This variety is partly due to the varying thickness of the gold flash, and partly to the different kinds of base, which also varies in thickness. Spoilt ruby is also another fruitful source of variety, that is, overfired, or when the metal in the pot, decreasing in quantity, becomes too hot. Spoilt in the sense that the maker has missed his aim, but invaluable to those who seek after unique effects. Not that copper ruby is to be entirely ignored. The darkest tones of copper ruby on blue may be used as a subsidiary red, but it can never take the place of gold ruby as the chief mass of red. Powell's brown ruby, a little gold (generally too little gold) mixed with the brown flash, leads to very varied reds, generally of a sombre sort, which may be used in a similar subsidiary sense.

Having shown you which are the best materials, I must say that architects are extremely lax in the matter of seeing that they get them in stained glass. If it were a matter of drain-pipes, they would study all the different kinds and specify those of a particular maker; they would have a dim sort of idea that if they did not do that, some cheap and inferior quality would be foisted on them. Ah! you will say, but stained glass is a sacred art; its makers could not do such things; why, therefore, take such precautions? If such be your touching faith, there is nothing more to be said; yet would it not be worth while to inquire where all the rubbishy glass goes to, and why there is so little good glass made that one is absolutely forced to plate a great deal more than one would? I do not see why architects should not specify Prior's "Early English" glass and Powell's "Antique." Let us admit it as conceivable that what I call the worst glass these people may consider the best; only permit me to remark that, if so, what they consider the best is invariably cheaper, much cheaper than that which I consider the best. If it is good to see that you get the best material, if it is better to see that proper use is made of it,

it is best not to go to any designer whose highest effort has been a public-house window. When I speak of the improper use of "Early English," I think of that church built by a prominent architect who has abjured figurework in stained glass, and who resolved to have the best glass in plain glazing. One can hardly blame the man for refusing to have a lot of rubbish shot into his church; although, to ignore it, is not to develop the art. It must be grappled with—taken in hand. If you cannot afford good stained glass, I would always recommend ornamental glazing, however simple, in the best glass, rather than cheap stained glass. Unfortunately, however, these windows have been done in almost pure white, consequently there is an utter absence of tone. To enter the church is like going into an ice-house. Even in ornamental glazing, tone and variety are essential.

Let me here make another assertion. Some of you may be under the impression that we put windows in to give light. That is not so with stained glass. A stained-glass window should be put in to give tone. You may deny this, but I say that however much you may strive, you will never get mystery or poetry into your buildings otherwise. The Catholic Cathedral at Westminster is a glaring instance. The architect's ideal of stained-glass was a gin bottle. He has tried to get as near to that as possible with roundels and Norman glass, that cheap imitation of "Early English." The windows have no relation to the building, nor have they any tone. Plaster the walls as thickly as you please with gold, mosaic and marbles, there will never be any mystery or poetry about the place.

Before beginning a description of the making of a stained glass window, I am reminded of a lecture by a distinguished man in the pottery line, which I was once taken to hear. The lecture was supposed to deal with certain difficulties in the firing of pottery; difficulties which confronted the Greeks of Homer's time, who immortalised them in a song. Well, we heard all about that, but as to the lecturer's methods of overcoming those difficulties, not a word. And there the poor pottery men sat, with open mouths, waiting for the crumbs which did not fall from the rich man's table. If speech is the art of concealing thought, then was this lecture a masterpiece. I do not intend to follow this artful craftsman's example, but to describe everything with the utmost frankness; and if I should inadvertently leave anything obscure, I shall be only too pleased to supplement these remarks at the close of my address.

The first thing, then, is the design, the coloured germ of the future window. This should be made to scale. I recommend 1 $\frac{1}{2}$ inch to the foot. This is convenient for making the cartoon, $\frac{1}{8}$ being equal to 1 inch, and one can put in a fair amount of detail and suggest variety of colour. The artist first to conceive the light and tone that will be in harmony with his subject. By tone in this connection I mean that which is a partial deprivation of a particular light, and must not be confounded with light and shade. To give the most familiar instance, moonlight and tone. We see objects that the moon does shine on cooler in tone than they are in daylight because the light of the moon is cold. In the same way, whatever light the subject demands (and it is not necessarily confined to sunlight or moonlight; it can be that "Light which never was on sea or land"), the tone must correspond. Every colour in the window therefore must be influenced by either the light or the tone.

Colour, which is our next consideration, has hitherto been said to be the chief thing in stained glass. But that is not so; there is a higher aim—mystery, the result of effects of light and tone, the absolutely indispensable quality in a stained-glass window. In a window we are dealing directly with light; there is therefore no need to conventionalise it, and as there can be no colour without light, we will call light the soul animating the body, colour. The quality of your window is therefore determined by the amount of light in it. It is in the quality of dealing with light that the genius of stained glass lies. It is this which differentiates it from every other medium. The colour must have a definite keynote, also in harmony with the subject. There must be a controlling sense of key, so that one may say this is a red window, that a blue one. Let me illustrate this in the simplest way. Suppose one had to do with four elements. The fire subject would demand a red window, earth a brown window, air a blue window, and water a grey window. This does not mean that the red window would be nothing but red, but that the keynote and the predominant mass would be red, and the colours of the other subjects would be worked in to enhance its effect and to form a connecting link with them. Hitherto windows have been a hopeless jumble of colours, every one for itself, and the Devil take the window. People seem to have started colouring a design at one end, without having had the least idea what the other end would be like. Not that there is any restriction on colours as long as they are subordinated to the key colour. Indeed, we have as much variety as possible, so long as the unity and harmony of the whole are not impaired. This variety will lead you into the most subtle effects, which will always add charm

to a work, and charm is a very essential quality. Strength and subtlety should be the character of the colour scheme, strength, of course, being derived from a bold treatment of the primaries. The primaries must be as rich and full as possible, and in bold masses, if your window is to have the necessary vigour and grip. So-called æsthetic colouring is unpardonable weakness in a stained-glass window.

With regard to the treatment of a light window, that end is not to be attained by filling the window with light colours of the same value. That simply results in a washy window, which looks as if all the colour had been bleached out of it. No, use as much "tint" as you like, but there must be some rich colour to show that it is intentionally a light window. The same remark applies to an ornamental window in tints. There should be a little rich colour to give it grip, and a little pure white, by which we may define the strength of the tint. Naturalistic colouring is not essential. Indeed, the most beautiful and glassy effects result from the unexpected. But it must have the appearance of inevitability; one must feel that to replace it with anything else would result in weakness—"and her hair shall be of what colour it please the glass-stainer." The traditional and symbolical colour of the draperies of Our Lord, the Blessed Virgin, the Apostles and others, together with their types, must be preserved (the colour scheme must be adapted to them and not the reverse); so that one may see at a glance who is being represented, or, should I say, one ought to be able to see? The church window is primarily to appeal to the eye of faith, and one must not assume that the eye of faith is practically non-existent, even though one have to explain to many a learned pastor (that is, shepherd) what would have been perfectly clear to the flock (that is, the sheep) of the Middle or so-called Dark Ages. This leads me to say that the symbolical is to be preferred to a literal treatment. At the same time, the symbolism is not to be a mechanical repetition of old forms, but a vivid personal insight into the heart of things.

The lead scheme should be considered, as it emphasises the rhythm of line and controls the masses of colour. Leads of various widths should be used, in proportion to the size of the window. The lead is not to be considered simply for its use in holding the glass together, but as the most important factor in the design. It is the skeleton of the window. It is not unusual for firms to employ outside people to make designs who have no practical knowledge whatever, but who can turn out an attractive design or a pretty piece of colour, calculated to deceive the unwary. These designs are to be known by the utter absence of any lead scheme, of the use of which the designer is profoundly ignorant. The result is that the window, usually carried out in the commonest glass, is not a bit like the design. There is one fatal error that must be avoided in putting in the lead lines. I allude to that pernicious practice of putting in curved lead lines when a round object like an arm or a rounded fold of drapery has to be cut on account of its length or to obtain variety of colour. In the case of an arm the curved leads look like bracelets, and in long straight drapery folds the curved lead lines used in alternate folds give the drapery the appearance of corrugated iron. One must never forget that a window is a plane surface and that round objects must be contradicted by straight leads.

Before the cartoon can be made sizes and templates of the window must be taken—the height from point to sill and the width, with laths. The templates are the shapes of the heads of lights from the spring line and of the tracery cut out of brown paper. These will be right size, to which about $\frac{3}{8}$ inch must be added all round to go into the groove. Is it necessary to say that a cartoon should be a fresh inspiration for every window? I am afraid it is, as some firms have no objection to using a cartoon a dozen times over. It would not be a bad plan for architects to insist on seeing the cartoons for every window they order. The cartoon should be made in sepia, as more nearly approaching the tracing and painting of the window, with the leads in black and their proper widths. It should have a bold significant outline, even for the features, with a little shading, and not washy lines simply as a guide for the painter. The outline is a characteristic of stained glass of any virile sort.

The outline from which the glass is cut, and afterwards leaded on, must now be made from the cartoon. The cartoon is laid on a bench and semi-transparent ammoniac paper laid over it. One then traces over the centre of the lead line with pencil, afterwards going over this with a brush in black ink. This gives one the heart of the lead—the skeleton of the window. Nearly every piece is now cut in sheet glass, to be used first as a "pounce," and afterwards to be painted on and fired. The exceptions are those pieces of "tint" or light colour that one can see the lines of the outline through, and consequently can be cut from the outline, and they will also be painted on. The method of using the "pounce" is to hold a sheet of coloured glass, which is generally varied in tone, up to the light, move the "pounce" over it until the exact place that you want cutting out has been found, then mark round it with a piece of French chalk. Hand this over to the cutter, who

breathes on it and pounces round the shape with a pounce bag containing powdered whiting. Still holding the "pounce" firmly, he marks round it with a pointed piece of hard wood, and removing it, its shape is found outlined on the coloured glass.

The other use to which the sheet glass is put is to paint on it instead of the coloured glass. It is a rule that the better the glass the less it will stand the fire. Besides the general loss of brilliance, all streaks or other variations have a tendency to go darker. Gold ruby is an impossible colour to fire; besides the aforesaid loss, it actually changes colour, becoming a hideous pink or magenta. Venetian opal, too, is an impossibility. No glass improves by going into the kiln; but sheet glass suffers least, as it is harder than coloured glass generally is. In glazing the coloured glass is kept in front of the painted piece, so that besides preserving the paint from the action of the atmosphere, it has something of the effect of varnish on a picture, adding to the transparency of the shadows.

(To be concluded.)

SHAFTESBURY ABBEY EXCAVATIONS.

A LECTURE was given by Mr. E. Doran Webb, F.S.A., at the South Wilts and Blackmore Museum, Salisbury, on the excavations on the site of the ancient Abbey Church of Our Lady and St. Edward the Martyr, at Shaftesbury. Mr. Doran Webb is hon. director of the excavations.

The Mayor of Shaftesbury, on taking the chair, said it gave him the greatest pleasure imaginable to come to Salisbury to preside at a lecture given by one so learned and so estimable as their friend Mr. Doran Webb. He lived at Shaftesbury for many years before he was aware of the existence of the place where the old Abbey stood, but when the Wilts Archaeological Society came to Shaftesbury some eighteen years ago, he joined them, and was very interested in their deliberations. They told them where the old Abbey once stood, and from that time he was fired with a desire to have the Abbey reopened. He tried in his meek and humble way to get the work carried out, but was unsuccessful. Eventually Mr. Doran Webb turned up and he would tell them what had since been done.

Mr. Doran Webb, says the *Wiltshire Mirror*, began his lecture by explaining the derivation of the word Shaftesbury, which he said meant a town on a hill. No Roman remains had been found at Shaftesbury, although it was said that some years ago Roman architectural remains were discovered in excavating for the foundations of a new house in High Street. In this sense the town was disappointing, but on Castle Green a little to the west of St. Mary's and at Barton Hill several Roman coins had been dug up. Overlooking the railway there were some earthworks called Castle Hill, but it was impossible to solve the problem whether they were Roman earthworks without digging. There were other traces of Roman occupation in the neighbourhood. At Donhead they came to Sticklebury Hill where the Rev. Canon Short found fragments of Roman pottery, and it was thought that this was the site of a Roman camp. If that were so he (the lecturer) suggested that the camp on Sticklebury Hill might have been the Roman Shaftesbury. The camp contained about 15 acres of land; on one side was the precipitous descent of the hill and on the other (the west) a deep ditch or rampart. Other earthworks in the neighbourhood were Winklebury and Duncliff. The road from Stourpaine to Bath passed through Shaftesbury, and close to Stourpaine to the left of the road was Hod Hill with its magnificent Roman camp on the summit. This road passed through Iwerne, where General Pitt-Rivers laid bare a fine Roman villa, and Colonel Best had made some investigations respecting the course of the Roman road in the parishes of Charlton and Ludwell, but as most of the land had been laid down for agricultural purposes it was quite possible that all traces of the road had been destroyed. In support of his argument that Sticklebury Hill was probably the site of the Roman Shaftesbury, he said that in those days the conqueror did not always occupy the site of the town he had taken if he could find a stronger and better place to pitch his camp. Shaftesbury, as they saw it to-day, struck one as being an extremely strong position, and it was his theory that it was the site of the present town that was occupied.

Passing on from the Roman to the Saxon period, the lecturer said they came on firmer ground. Shaftesbury had now become an important place. The castle near St. Mary's was either in course of being built, or more probably, as was the case at Old Sarum, was being repaired and strengthened. Such defensive works at the time he was speaking of consisted of a ditch or raised bank strongly stockaded, and enclosing more often than not an irregular shaped piece of ground. Within the enclosure were rude stone buildings covered with thatch which formed the actual castle, with perhaps a stronger work in the shape of a tower which in subsequent times became the keep of our twelfth-century castle. Saxon interments such as those excavated by General Pitt-Rivers at Winklebury and elsewhere were by no means uncommon in the neighbourhood.

But the written history of Shaftesbury, apart from that which was written on the face of the earth in barrows and camps, commenced with the ninth century with a grant of land to the church and convent of Shaftesbury by King Alfred, whose daughter Elgiva lived as a nun here, becoming before she died in 946 abbess of the convent. For the next 600 years the history of the town was so closely bound up with the history of the great Benedictine house that grew up in its midst as to be quite inseparable the one from the other. They would find that as far as Shaftesbury went the ancestors of his friend Mr. Powell, the mayor, were the representatives of the lady abbess. No one could say when the first Mayor of Shaftesbury was elected or when the first Town Council sat. Like the towns of Romsey and Malmesbury, the importance of the church and its fame as a place of sanctity attracted large numbers of visitors, and so conduced to the prosperity of the town and its inhabitants. The church at Shaftesbury was richly endowed by the Saxon kings. The queen of Edmund Ironsides was buried in the church, and Canute, that monarch's great rival, died at Shaftesbury. But the greatest event in the annals of the monastery was the translation in 981 of the body of St. Edward, the king and martyr who was slain at Corfe Castle by the treacherous hand of Queen Elfrida, his step-mother. She, repenting of her crime, was said to have been instrumental in causing the removal of the saint's body, but what was more certain was that she founded Wherwell Abbey, near Andover.

In Norman times, the lecturer said, they had in the Domesday Survey the assessment of Shaftesbury. From that they learned that Shaftesbury was such an important town at the time of the Domesday Survey that it was assessed at twice as much as the county town of Dorchester, less than half as much as Old Sarum and four times as much as Exeter and Bridport. Shaftesbury was a borough by prescription. That was to say, its origin was so remote that no man could either fix a date when it was first incorporated or produce its original charter. The lecturer went on to describe the arms of the borough and the two very interesting maces in the possession of the Corporation. In the thirteenth century Shaftesbury boasted of eleven churches besides the abbey church. At the present day there was one old church, St. Peter's, in the High Street, and three modern buildings, namely, Holy Trinity, St. James's and St. Rubald. St. Peter's Church was an excellent example of what a town church was in the fifteenth or latter part of the fourteenth century. The lecturer gave a very interesting account of the old edifice, in the course of which he said that the south aisle of the church contained a large crypt, which was now used as a vault by the tenant of the adjoining public-house. He said that the church was one of the most interesting buildings that had been left at Shaftesbury, and they all hoped that some day it might be put into a better state than it was at present. As they stood on Shaftesbury Hill they were struck with the magnificent view, but it had not always been what it was to-day. Shaftesbury as late as the thirteenth century was almost surrounded by what was known as the Gillingham Forest, which was said to have reached from Blandford to Wilton. On March 23, 1539, the king seized the revenues and estates of the Benedictine house at Shaftesbury, pensions being granted for life to the last abbess, Elizabeth Zouch, and other of the nuns. The estates were partitioned out among those who were able to purchase them and others who through favour at Court could obtain a free gift of land. The effect of this wholesale destruction of religious houses throughout England, which were at once the havens of the poor and a means of support to those able to work, was that many towns such as Shaftesbury fell into ruins. This could easily be seen from an Act of Parliament passed in the 32nd year of the reign of Henry VIII, which stated that "whereas there hath been in times past many beautiful houses within the walls of (here follow the names of fifty-eight cities and towns, Shaftesbury being one), which houses are now fallen down decayed, and at this time remain unre-edified, as desolate and vacant grounds, many of them nigh running to the high streets replenished with uncleanness and filth, with pits, cellars and vaults, lying open and uncovered to the great crowd of the King's subjects, &c. &c." Passing to the appointment of John Bradley, the last prior of Wilton, as a suffragan Bishop with the living of Shaftesbury, the lecturer said they came to the Civil War period when the town became the scene of several sharp skirmishes between the forces of the king and those of the Parliament. Having spoken of the Clubmen who encamped at Shaftesbury and who cared nothing for king or Parliament, and their defeat on Castle Hill, Mr. Webb called attention to some interesting points on an old plan of Shaftesbury which was thrown upon the screen, after which pictures of the ancient wall on Gold Hill were shown.

Several photographs of the discoveries made on the site of the old abbey were exhibited and explained by the lecturer, who said the work of excavation on the site of the ancient abbey was commenced on Monday, June 9, 1902, and was con-

tinued for a period of twenty-one weeks. The cost of the work had amounted to 166*l.* 13*s.* 3*d.*, and of this sum the Mayor and Corporation of Shaftesbury gave 50*l.*, the remainder of the money being contributed by members of the committee and others who took an active interest in the success of this most important archaeological undertaking. The foundation of the north wall of the choir apse was first revealed, and following up the line of this wall westward a grave formed in the thickness of the masonry was next discovered. This grave contained three skulls and a thigh-bone. The grave has since been filled up with earth, but chiefly with human bones found scattered all over the surface of the excavations. As it was important that the northern half of the garden should first be excavated only a partial exploration of the site of the church was made. Sufficient was done, however, to prove that the church ended in this direction, both externally and internally in a semicircular apse. The base of the altar, with its footpace and portions of the steps leading up to the latter, were also uncovered. The site of the north choir aisle was next excavated. This aisle terminates in an apse internally although externally it has a square east end. It measured 12 feet in width by 56 feet 3 inches in length from the centre of the apse to where the aisle joins the north transept. The aisle is divided from the chancel by a wall 8 feet in thickness pierced at its eastern end by a doorway 2 feet 9 inches in width, which afforded a means of access from the one to the other. Fourteen inches of the western jamb of the doorway remains in position, and built into the wall at a point 2 feet 10 inches to the west of this jamb was the moulded base of the shaft of a semicircular Norman respond, the shaft measuring 1 foot 4½ inches in diameter. A low stone bench, similar in character to that existing in Salisbury Cathedral, appeared to have run the length of the aisle against the inside of the north and south walls. The floor of the aisle was divided by two steps into three levels, and some portions of the floor were covered with tiles. Though many of the tiles were defaced by wear and exposure to damp, yet on a good number of them could still be traced the arms of families connected with the neighbourhood, amongst them being those of the Montacutes, Earls of Shaftesbury. A member of the family, William Montacute, Earl of Shaftesbury, was involved in a dispute about the ownership of Sherborne Castle in 1373 with Robert Wyville, Bishop of Salisbury, which near result in a trial by combat. The Cheney's were another local family; their arms were "four fusils in fess, each charged with an escallop." Sir John Cheney lived for a short time at Wardour Castle and lies buried under a noble monument in the north aisle of Salisbury Cathedral. The arms of the Bryons and the Stourtons were also represented on the tiles. A number of graves were found whilst removing the earth on the side of the foundations at the east end of the north aisle. The excavation of the chancel and north transept was next taken in hand in the hope of finding the entrance to the crypt mentioned by the Rev. J. Reynolds as having been partially explored in 1861. The floor of the chancel so far as it had been uncovered consisted for the greater part of a tile paving in fairly perfect condition. Many of the tiles, which were thirteenth century date, were of the usual red colour, stamped and inlaid in whitish clay with various designs. Twenty-eight feet 6 inches east of the boundary wall of the abbey house garden the eastern face of the north-east pier which supported the central tower was discovered, and the steps leading down to the crypt were unearthed on September 23 last. By the middle of the next day the whole staircase was laid bare and it was found that the crypt measured 24 feet from east to west by 17 feet 11 inches in width. The crypt was evidently an addition, and, judging from the remains of the vaulting, was built in the thirteenth century. In the crypt were found immediately beneath the windows two large heaps of human skulls and bones mixed with a quantity of broken pottery, together with some pieces of stained glass, a mutilated defaced Early English capital, the base of a small statue which had been gilded, seven inches of a spiral column 6 inches in diameter, painted blue and red, and a piece of thirteenth century arcading of Purbeck marble. A large number of fragments of jambs, mullions and tracery of fourteenth and fifteenth-century windows were found all over the site of the excavations. In conclusion, Mr. Webb stated that a sum of 150*l.* was required to finish the work in the remaining portions of the garden, and after this was completed there would still remain to be excavated the nave and aisle of the church in the adjoining abbey house garden.

A Sessional Meeting of the Sanitary Institute will be held at the Parkes Museum on Wednesday, March 11, 8 P.M., when a discussion will take place on "Sewage Disposal and the qualities essential in a Sewage Effluent."

LIVERPOOL CATHEDRAL.

A LIVERPOOL correspondent writes to the *Times* in advocacy of the cathedral scheme. The Liverpool bishopric, he says, was founded in 1880. The effort in the direction of a cathedral was represented in 1900 by an antiquated Act of Parliament, the sag-end of a committee, a certain amount of experience and an empty purse. In this latter year Bishop Chavasse's inspiring dream of a cathedral, told at his diocesan conference, showed clearly enough that the hour for another effort had come, and the man. Since then many steps have been taken, 157,000*l.* raised, a site secured and other important arrangements made, the necessary Act of Parliament obtained, and five chosen architects are now preparing for the final competition, which, as in the days of Ghiberti and Brunelleschi at Florence, will decide who is to build the cathedral. It is hoped that this decision will be made within a few months' time, and that the foundation-stone will be laid by some very august person before the middle of 1904. Compared with the progress made at Truro this may seem slow work. But Bishop Benson was a very exceptional man, and the problem to be solved was far less complicated. If comparison must be made, it should rather be with the Roman Catholic Cathedral at Westminster. Liverpool has no reason to be ashamed or downhearted. The delay hitherto has probably been most helpful to the real success of the scheme.

But rapid progress ought soon to be made. The acquisition of a suitable site is, in a crowded city, a matter of the utmost importance. No more can be expected than that the best site possible (all things being considered) shall be chosen. In Liverpool, out of several competing sites, the one finally decided upon and secured is what is known as St. James's Mount, some of the highest ground in the city. It has several great merits. It is sufficiently out of the way to be quiet, and sufficiently in the town to be easily accessible. Houses in which the cathedral clergy may live are abundant in the neighbourhood. Considered architecturally the site is almost ideal. From Hope Street the cathedral will be seen across the deep hollow of St. James's Cemetery, standing up against the sky on the top of the wooded cliff, some 50 feet high, which bounds the cemetery on its western side—the whole of one long side and the principal façade being viewed without interruption from a distance of, say, 500 feet. At Durham the river Wear washes the foot of the hill on which the cathedral stands. At Liverpool the place of the Wear is filled by the very remarkable cemetery. Water has always a special charm. But, making allowance for this, comparison may fearlessly be made with Durham. Moreover, at Liverpool the Mersey has to be thought of—that river which is so great a factor in the life of the city. And from the river, on a clear day, the cathedral on St. James's Mount will look, to quote the words of Mr. J. A. Symonds, spoken of the Duomo at Siena, "as though set like a marble coronet upon the forehead of the town."

There is one objection to the site which must be noticed. With some it has no weight. With many others it weighs heavily. In building the cathedral on St. James's Mount the practice of orientation will probably have to be departed from. The Dean of Ely has, indeed, published an ingenious plan whereby the necessity of this may be avoided. But it is probable, or, at least, possible, that the Liverpool Cathedral will have to stand north and south, and so be singular amongst English cathedrals, and, in fact, almost unique amongst the cathedrals of Christendom. This is much to be regretted. But in exceptional circumstances exceptional conduct is justified, and the building of a large cathedral in a city of the size of Liverpool is certainly exceptional. There are, moreover, good precedents for a north and south position. San Petronio, at Bologna, and Sta Maria Novella, at Florence, both built when orientation was carefully attended to, and the latter built by the early Dominicans, who were most particular about that sort of thing—these two great churches were built north and south, and clearly enough for the precise reason which obtains at Liverpool, viz. the impossibility of building east and west owing to exigencies of site.

With regard to style, the competing architects have a free hand. They have, indeed, to provide an open space, unbroken by pier or pillar, in which 3,000 persons may see and hear a preacher. This might seem to point to the Renaissance and a dome. But not necessarily to the Renaissance. In St. Paul's Cathedral 4,000 persons may see and hear the preacher. But the octagon at Ely and the adjacent parts will accommodate 1,900 persons. Clearly at Liverpool the open space must be larger than that at Ely, and smaller than that at St. Paul's. Is there any reason why there should not be a "Gothic" dome? The Renaissance dome at Florence was placed upon Talenti's Gothic substructure. Why might not its details have been Gothic like those of Pisa or Ely? Does any one suppose that if an architect possessing Alan de Walsingham's taste and Brunelleschi's technical skill were to build a Gothic dome its correctness would be open to question? Hence there is no limit as to style; neither is there any limit as to expense.

Dignity and beauty and suitability to the sacred purpose are the chief matters which the architects are to have in mind. There is thus no fear that a second-rate building will be erected if a first-rate one can be planned.

It is clear that the building committee have set their hands to a work which will tax all their powers. The old cathedral builders could depend for income upon a variety of sources, such as indulgences, shrines and bishops able to contribute princely sums. These are things of the past. So, too, are the coal and wine dues, which mainly paid for St. Paul's. Only the voluntary subscriptions of churchpeople can be depended upon. Nonconformists are sometimes ready to give generous help to such undertakings, which should always be gratefully accepted, but such help cannot be counted upon, nor, without great loss of dignity, asked for. Much of the wealth of Liverpool is in Nonconformist hands. The churchmen of the diocese will probably have to be educated before they will give freely. In the city of Liverpool itself the work will be comparatively easy. Fortunately the pro-cathedral is so manifestly and even ridiculously inadequate that Liverpool churchmen have constantly before them a striking object-lesson, which makes them well aware that something must be done at once, and the thought of what the dignity of the city demands will in Liverpool, as in so many an old Italian city, secure that what is done shall be done well. But the more distant parts of the diocese may be inclined to regard the work as a Liverpool affair with which they are not concerned. Hence the diocesan spirit will have to be cultivated, and every churchman led to take the same interest in his diocese which the soldier does in his regiment.

But the building of this cathedral is a matter of more than diocesan interest, and it cannot be accomplished in any reasonable time without considerable outside help. During the last twenty-five years the diocese of Liverpool has not been idle or stingy. The foundation of the bishopric cost at least 100,000*l.* During Bishop Ryle's episcopate forty-four new churches were built at a cost (in addition to the value of many sites given) of 1397,000*l.*; 28,546*l.* has been spent upon the portion of the church-house now in use, and 157,000*l.* has been promised for the cathedral. There has thus been an abundance of self-help in the Liverpool diocese. It has received from the rest of England much excellent advice. It is doing its best to carry this out, and to build a cathedral of which the nation may be proud. It not unnaturally looks for help from many outside sympathisers.

ANCIENT ROME IN 1903.

THE first of the present year's series of Carpenters' Hall lectures on matters connected with building was delivered by Professor R. Elsey Smith, A.R.I.B.A., on Thursday evening, February 19. The lecturer, who was introduced by Mr. Aston Webb, A.R.A., P.R.I.B.A. (chairman), took for his subject "Ancient Rome in 1903," and pointed out that the city of Rome occupied an unique position amongst the still thriving cities of the world, as it could boast ever since the date of its legendary foundation 753 B.C. a continued existence and an influence in the life and history of the world such as no other single city could claim. After tracing its foundation on the great rocky eminence of the Palatine Hill, and its rapid growth under the early kings, as well as during the Republic and the period of the Empire, when the rulers vied with one another in erecting or extending palaces and undertaking mighty works for the entertainment of the populace, Professor R. Elsey Smith pointed out the vast remains of the works of the first century, A.D., which now exist to testify to the greatness and splendour of Rome. After describing the walls, the cloacæ, the roads and the water-supply, the lecturer proceeded to dilate upon some of the more strictly architectural works with which the great city was adorned, beginning at the centre of Roman life, the Forum, followed by the Temple of Vespasian, the Temple of Antoninus and Faustina, the Temple of Castor and Pollux, the Temple of Saturn, the Temple of Romulus, the House of the Vestals, the Rostra, the Arches of Titus, Severus and Constantine, the Columns of Trajan and Marcus Aurelius, the Basilica, the Baths of Caracalla, the Stadia, the Colosseum and the Pantheon. In conclusion, he remarked:—"One cannot perhaps more fittingly terminate this brief view of what still remains to us of the Rome of the ancient Romans, to whom we as a nation owe not a little, than in this great building (the Pantheon) which has stood for more than eighteen centuries, and, built as a heathen temple, has for close upon thirteen hundred years been consecrated as a Christian church, and by many Italians is especially venerated as the last resting-place of the great King Victor Emmanuel, who, with the aid of wise counsellors and great soldiers, united under his rule the scattered States of the Peninsula, and long may the Eternal City flourish as the capital of United Italy."

The lecture, which was listened to with marked attention

by a large audience, was illustrated by a number of beautiful lantern views from photographs taken for the most part by Professor R. Elsey Smith, to whom a hearty vote of thanks was tendered for the interesting and practical instruction which he had so ably afforded.

EXETER CATHEDRAL.

THE following letter from the Dean to the *Times* relates to the window scheme:—Mr. Moore has made the following statements:—(1) "That the Chapter have suffered from a chronic mania for destroying every relic of ancient art in their wonderful cathedral as opportunity offers." (2) "That his intervention prevented the removal of the great east window and the substitution of a wheel window of Scott's design." (3) That he prevented the "entire sweeping away by the Chapter of all the ancient glass in the St Gabriel's Chapel." (4) That the ancient glass "has totally disappeared." (5) "That he offered at his own cost to rearrange and replace the ancient glass and was refused by the Chapter." (6) That he has "vainly endeavoured to persuade" the Chapter to take certain steps for the preservation of the glass.

Wishing to be accurate in my reply, I have, before writing, caused search to be made in all the Chapter records and documents, minutes, &c., rough notes and letter-books during the period in which the restoration of the cathedral was under consideration and in progress. There is no mention at all of any such renewal to be found, and there is no mention of Mr. Moore's intervention. This is significant; but there is an entry, which I shall give lower down, which disproves absolutely one of Mr. Moore's accusations against the dead members of the past Chapter. But I was not content with this evidence alone. I have inquired carefully of persons who were employed on the work, such as the son of the gentleman who carried out the works, who was in daily communication with the Chapter, and of the glass artist to whom the glass was entrusted; of Mr. Battishill, the present Chapter clerk, who was the active partner of the then clerk; of Mr. Scott, the successor of the late Sir Gilbert, who was, according to Mr. Moore's story, ordered to provide the wheel window. Fancy Scott putting a new wheel to face that in the west. All these persons say that no such plan was ever for an instant in the mind of the Chapter or Sir Gilbert Scott. All speak with absolute certainty, not only in direct denial of Mr. Moore's statement, but they all concur in saying that they knew that the great east window was regarded by all the Chapter with special admiration. This, again, is significant. The documentary evidence is confirmed—the great east window never was in danger; Mr. Moore did not rescue it from the maniacal destructiveness of Sir Gilbert Scott and the then Chapter, who cannot, alas! speak for themselves. But I was not yet content; as the dead could not speak for themselves I communicated with their representatives. Dean Boyd's representative, who knew every detail of the work and loved it, tells me the great east window was the Dean's special admiration, and that he never dreamed of its removal and that Mr. Moore had nothing to do with its preservation at all. Its removal was never discussed. Again, the documentary evidence is confirmed. Mr. Freeman writes—he was closely associated with his father:—

"I cannot believe that there is any foundation for the charge. I am certain that any such proposal would have met with the strongest disapproval both of my father and of the other members of the Chapter, in whose eyes that window was held as one of the glories of the cathedral."

The same evidence is given with equal certainty by the representatives of Precentor Cook and Archdeacon Woolcombe, both always on the spot and always in the thick of the restoration. I give my own testimony last. I knew and loved all these good men as friends and fellow-workers. I frequently visited and discussed the cathedral with them during the restoration and before. I never once heard it suggested by any one of them that the great east window should be removed and a wheel window of Scott's design inserted. You have had Mr. Scott's evidence in your columns.

As to the next statement, that Mr. Moore prevented the Chapter from "entirely sweeping away the old glass in St. Gabriel's Chapel," the evidence of Mr. Luscombe and Mr. Drake, the cathedral glazier, is to the effect "that the Chapter exercised the greatest care, and that the glass was carefully laid out and examined, and subsequently, under the careful direction of the Chapter, placed where it now remains," a witness to the carefulness of the Chapter. And here comes an extract from our minute-book approving a letter received from Sir Gilbert Scott and requesting that he should prepare designs for both windows—that is, one for the old glass the other for the new—in St. Gabriel's Chapel. This does not look like sweeping away the old glass. It may be well here to quote from Mr. Drake's lecture on the glass of Exeter Cathedral, because it will not only serve to illustrate the real carefulness

of the Chapter, but will also cast a strong light on the real value of Peckett's work, which Mr. Moore admires:—

"Some very poor glass (Peckett's) was removed at this time from the great east window. The window had suffered much in an attempted restoration by Peckett, 1761. Heads of the true Georgian type were put on the figures, and the canopies were much tampered with. Mention of these figures reminds me of a curious freak of Peckett of west window renown; he it was who inserted the funny heads. In the light next the centre on the south side is a bishop; his head is covered, not with a mitre, but with a piece of a broken canopy from another window which to Peckett seemed like a mitre."

And lower down:—

"The borderings and surroundings, the work of Peckett, are of such a description that we would desire to speak gently of."

So much for Peckett in 1761. In reply to his next charge—"that the ancient glass has (by the fault of the Chapter) totally disappeared"—here we are on the firm ground of facts. What are they? The glass referred to has from time to time been carefully used, and the remainder is still carefully preserved for future use. His next statement, that he offered at his own cost to restore and replace the ancient glass, but that the Chapter refused—well, we have records over and over again of gifts and offerings which can only according to our procedure be made through the Chapter—one such offering with respect to this very glass, but it did not come from Mr. Moore. There is no mention of such an offer from him, and no one at that time connected with the Chapter can remember any such offer having been made. As an imputation lies under the statement that such an offer was refused, perhaps the refusal can be produced; there is no mention of the offer. Mr. Moore next states that he has "vainly endeavoured" to persuade the Chapter to take certain steps for the preservation of the glass, &c. No living member of the Chapter can recall any instance of this, and there is no mention of it in letter-book or minutes; and no such "vain endeavours" were necessary, as the minutes indicate sufficient care of the whole fabric from week to week, and the glass is still cared for. As to the rash nonsense of his opening charge, that the Chapter suffered from a chronic mania for destroying "every relic of ancient art in their wonderful cathedral as opportunity offers," such violent extravagance of statement carries its own refutation.

RECENT ANTIQUARIAN DISCOVERIES IN EGYPT.

A CORRESPONDENT of the *Scotsman*, Mr. W. M. Bryce, writing from Luxor on the 3rd inst. says:—While the citizens of Edinburgh are shivering with cold, we, the favoured few from the old town temporarily resident here, are in the enjoyment of perennial sunshine. Instead of golf we have the educative pastime of studying the ruins of the ancient temples and tombs which so liberally bestrew both sides of this portion of the Nile. And in respect of antiquarian matters Egypt is a land of surprises. Every year fresh discoveries are made, stretching back the history of this ancient land, and throwing new light upon the domestic life of its inhabitants. Professor Flinders Petrie has opened to us the prehistoric period, which carries back the history of the world to a period of more than 7,000 years from the present time; and now even the prehistoric period, from the discoveries made last season, is in course of division into early, middle and late. The names of new kings of the late prehistoric have recently been found by Professor Petrie at Abydos, and thus this portion of the prehistoric is losing its designation and becoming known as the predynastic.

On the Luxor side of the river Mr. Le Grand, a French official of the Museum at Cairo, is engaged in clearing out the temples at Karnac, and re-erecting the massive pillars which fell down three years ago—a huge undertaking. Last week he recovered from the mass of rubbish two fine statues of black granite—a stone much darker in colour and harder to cut than our grey Aberdeen granite. But it is to the operations conducted on the west side of the river, among the ruined temples and palaces of Thebes and the royal tombs of the kings of the eighteenth and nineteenth dynasties that attention has been drawn. A great discovery, over which Egyptologists are much excited, has been made here two weeks ago. Now there are three separate expeditions carrying on excavations on that side of the river. The most southerly is under Mr. Tytus, a young and wealthy American, who is exploring the ruins of the palace of Amenhotep III. Mr. Mond, a Hebrew gentleman and naturalised Briton, has taken the tombs above Kurna as the scene of his labours. Both of these gentlemen bear the expense of their own excavations, but the work in both cases is under the superintendence of Mr. Newberry, an Egyptologist of considerable repute. It may be here explained, that the authorities of the Cairo Museum have the privilege of selecting any of the

"finds" they desire, the remainder being at the disposal of the parties licensed to carry on excavations. The third and most important of these operations is under the able management of Mr. Carter, inspector of monuments for Upper Egypt, but at the expense of Mr. Davies, another wealthy American, and a great collector. For some years past Mr. Davies has paid for similar work, and it is rather galling to the Briton to see printed notices in Americanised English stuck over the entrance to tombs bearing the legend "Conserved by Mr. Theodore M. Davies, U.S.A." It is rather remarkable that, seeing Egypt is now practically a British possession, not one single wealthy Briton seems to take the interest which these Americans show in work of this kind. Northward of the beautiful tomb of Queen Hatasu—a lady as famous in Egyptian history as our Mary Queen of Scots—is a projecting spur of the mountains; and on the other side is a narrow winding valley, near the head of which the kings of the eighteenth and nineteenth dynasties were buried in tombs cut out of the living rock. The stone is a fine siliceous limestone. Several of the tombs, with their grand halls and passages, have been cut from 250 to nearly 500 feet into the mountain side, the sides and ceilings being ornamented with carvings in relief, all painted with colours as varied as those which adorned Joseph's coat. These paintings look as fresh as if painted yesterday. Six of these tombs are now brilliantly lit by electricity, while wooden gangways and barricades protect the traveller as well as the pictures from injury. Nowhere in our country has such magnificent provision been made for the protection of our national monuments. It is among these tombs that Mr. Carter was fortunate enough to discover on the 18th of last month the tomb of King Thothmes IV. Of this monarch very little seems to be known. He was the son of the warrior King Amenhotep II., and reigned in the latter portion of the sixteenth century B.C. His mummy had been removed to his father's tomb, whence it has been transferred to the museum at Cairo. He is mainly known to the present generation by the memorial-stone which he placed in front of the Sphinx at Gizeh, and on which he records the fact that, in obedience to a dream, he had cleared away the sand in front of that remarkable monument. The interest in the present discovery is due to the belief that, although despoiled of its gold and silver ornaments some two or three thousand years ago, the tomb has remained untouched since that date. The door has been kept closed until to-day, when it was opened in presence of Mr. Maspero, the learned head of the museum, and Messrs. Davies, Carter, Newberry and Tytus. The leather front of a war chariot is known to be among the "finds." The only chariot hitherto preserved is, I believe, in the museum at Turin. The beautiful pottery and glass—for the period of the eighteenth, like that of the twelfth, dynasty was famed for its artistic efforts—seem to have suffered at the hands of the ancient depredators. Last year there was found, during the operations conducted under the ægis of Mr. Davies, two leather aprons, soft as the finest kid, and stamped and cut into patterns like silk network. Some little time must elapse before the work of making the necessary inventory as well as transferring the contents of the tomb to Mr. Carter's house is completed, and Egyptologists must wait the result with patience. In the meantime the three young gentlemen, Messrs. Carter, Newberry and Tytus, will remain on guard, night and day, at the tomb to protect it from the Arabs. And there is certainly a great necessity for caution. Last week at Abydos, one of the best of the statues unearthed by Professor Flinders Petrie, which only a month ago he showed to Professor Sayce and myself with pride, was stolen by the Arabs living in the neighbourhood. The stone must have weighed two tons. Mr. Maspero had a somewhat similar mishap four days ago in the Governmental dahabyeh in which he arrived here. During the night thieves entered the dahabyeh and cleared out all his silver—except one fork—and linen. Fancy Madame Maspero's dismay next morning. The crew are popularly believed to have had a hand in this new mode of "excavation."

License to excavate is granted by Mr. Maspero and a committee, the majority of whom now are Britons, and the work is carried on by officially recognised societies in Great Britain, America, Germany, France and Italy, as well as by private individuals. These are all supposed to print a record of their work, and the proceeds of their "finds," after deduction of the portion selected for the museum, are expected to be handed over to museums, universities, or other public institutions. With some of the private excavators it is alleged this is not done, and hence some soreness has been expressed that parties should be allowed to make excavations for the "loot" they find. There is a law to prevent this kind of "looting." Professor Flinders Petrie's party consists of himself, two assistants, Mrs. Petrie and two lady assistants, and a posse of nearly three hundred Arabs. Mrs. Petrie occupies herself in making the drawings. The Professor represents the Exploration Fund, which is an Americano-British society. Dr. Reisner, of California, has chosen the east side of the river bank,

opposite Girga, as the scene of his labours, and his work, like that of Professor Petrie, is conducted on most methodical lines. His expenses are paid by Mrs. Hearst, the foundress of the University of California. It is not generally known that these Egyptologists, such as Professor Petrie, give their services gratuitously, their actual expenses being only refunded to them. The German expedition is mainly supported by the Emperor, who, in addition, furnishes more money for "antikas" than is given by any public or private institution—the British Museum included—in Europe. As Dr. Reisner observed, the object is largely political. The French representatives seem within the last two or three years to have sunk in importance. It was very different half a dozen years ago, when the violently anti-British Monsieur Grébaut was director of the Museum. He became latterly so impracticable to his own countrymen that they took steps for his removal. The Italians excavated at two places last year. Among the private excavators is young Mr. Garstang, of Liverpool, who works at Beni Hassan for a syndicate consisting of two bankers and a Liverpool merchant. A report is published and none of the "finds" sold. Then there is Mr. Greenfel, whose specialty is the unearthing of papyrus, and the Archaeological Survey, the president of which is our new citizen, Professor Sayce, of Oxford, with Mr. Griffith as the transcriber and translator of inscriptions.

TESSERÆ.

Fifteenth-Century Stained Glass.

IT is conjectured from agreements still extant that as the mechanical part or soldering together the almost infinite number of pieces was effected by ingenious glaziers, a design or pattern exactly coloured, and probably the work of some ecclesiastic, was provided from which a window might be composed. Still, it may be presumed that histories taken from any single object recorded in Scripture were by no means common. All the cathedral, conventual or larger parish churches built or added to in this century had many spacious windows of stained glass, but from remaining fragments it is evident that the figures were individually placed, sometimes accompanied by angels clothed in peacock's feathers, who held the escutcheons. Windows at Cirencester, in Gloucestershire, recomposed from the fragments of many others, exhibit "shapes that with one broad glare the gazer strike, kings' bishops, nuns, apostles, all alike." During this century stained glass was more generally admitted into castles and private houses of the nobility, in the chapels or oratories, halls or large apartments. The exquisitely finished sacella or sepulchral shrines were embellished with it, more delicately and minutely designed than that which was put up in the larger windows. They are universally destroyed. The exact period when stained glass was first introduced into the houses of kings and nobles cannot be ascertained. Chaucer in his "Dreme" describes the story of the siege of Troy as painted on the windows of his own house, and it may be inferred that such embellishments were sometimes seen in the structures of the fourteenth century which were not merely ecclesiastical. Charles V. of France, Chaucer's contemporary, ornamented not only his chapels, but apartments in his castles with stained glass. At Aston Hall, near Birmingham, is a series of armed portraits with tabards and the armour of the age of Edward III. There are nine figures to represent two earls of Mercia and seven of Chester. They were first set up in the great hall at Brereton, Cheshire.

Byzantine and Roman Foliage.

Byzantine foliage differed from Roman foliage inversely as Roman had differed from ancient Greek; for when the seat of Imperial Government was removed from Rome to Constantinople, the architectural sculptors seem to have reverted to Greek examples as distinguished from Roman. It followed that, not only at Ravenna, where the Byzantine style was as much at home as at Constantinople, but centuries later when the style was a second time transplanted into Western Europe, a Greek tinge was given to the works of those schools of architectural carving which were influenced by it; and this was the case not only in those parts of France where, as in Périgord, Byzantine architecture was, in a pronounced form, adopted as a model, but it extended even into the Northern provinces, whose architecture was in other respects purely Romanesque; so that while the architecture of the twelfth century about Paris was either distinctively Romanesque or a transition founded upon that style, its foliated ornamentation was as distinctly Byzantine. The capitals were not only founded on the Corinthian, but their leaves were of the Greek as distinguished from the Roman type of the acanthus. From this acanthus leaf was, by different stages and especially from specimens accidentally left unraffled, developed the very different leaf known as the *crochet*, and the very typical French capital known as the capital "*acrochet*."

Border Peel Towers.

The royal castles on the Scottish Border boasted little splendour. That of Newark, a favourite hunting-seat of the kings of Scotland, is merely a large and strong tower, surrounded by a wall of defence, or barnkin. The smaller gentlemen, whether head of branches of clans or of distinct families, inhabited dwellings upon a still smaller scale, called peels, or bastle houses. These were surrounded by an enclosure or barnkin, the wall whereof was, according to statute, a yard thick, 6 yards in height, surrounding a space of at least 60 square feet. Within this outer work the laird built his tower, with its projecting battlements, and usually secured the entrance by two doors; the outer of grated iron, the innermost of oak, clenched with nails. The apartments were placed directly above each other, accessible only by a narrow "turn-pike" stair, easily blocked up or defended. Sometimes, and in the more ancient buildings, the construction was still more rude. There was no stair at all; and the inhabitants ascended by a ladder from one storey to another. Smailholme, or Sandiknow Tower, is one of the most perfect specimens of this species of habitation, which was usually situated on the brow of a rock or the brink of a torrent; and, like the castle of the chief, had adjacent huts for the reception of those who were called upon to act in its defence. The castle of Bemerside, the residence of the ancient family of Haig, is a tower of the same kind. Upon a sudden attack from any small incursive party, these "strengths," as they were called, afforded good means of defence. Artillery being out of the question, they were usually attacked with bows, or hagbuts, the discharge of which drove the defenders from the loopholes and battlements, while the assailants, heaping together quantities of wetted straw, and setting it on fire, drove the garrison from storey to storey by means of the smoke, and sometimes compelled them to surrender. The mode of defence, by stones, arrows, shot and scalding water, was equally obvious and simple; and, in ordinary cases, by such means of resistance, joined to the strength of the place and the military disposition of the inhabitants around, who readily rose "to the fray," a desultory attack was easily repulsed.

Apsidal Chapels.

In the Romanesque churches of the South of France a quantity of chapels are attached to the choir and transepts, each consisting of a wagon vaulted compartment and a semi-domed apse. Thus, at La Charité there are five of them, radiating from the apsidal aisle, and two on each side attached to the east walls of the transept. The crypt of the church at Mont Majour, near Arles, has a similar arrangement with seven chapels, which also appears at Valence. In all these cases there is a space of wall and a window between the openings of the apsidal chapels, which serves to light the aisle. Professor Willis was of opinion that the use of radiating chapels behind the choir, which was so universally practised in Gothic, first arose in this district. The intermediate windows were afterwards abandoned, as the chapels were increased in size and touched each other, leaving no space for them. They may be found in some of the large churches of the Netherlands, however, as at St. Jacques, Antwerp, in which the apsidal aisle is polygonal and has five sides; three of these communicate in the ordinary way with large polygonal chapels, while the two intermediate sides, instead of opening into similar chapels, have large tracery windows. Part of this window can be seen from the transept of the church, and produces a very singular and beautiful effect of architectural intricacy by its combinations with the chapels and aisles. These chapels with their aisle behind the choir should be carefully examined, as the architect evidently delighted in the contrivance of intricate vaulting and plans for this place, so favourable from its form to complexity of arrangement. Amongst other specimens may be mentioned St. Sauveur at Bruges, St. Jacques at Antwerp, the cathedrals at Augsburg and Munich and St. Trophime at Arles, every one of which exhibits some singular and ingenious device.

GENERAL.

Mr. Thomas Ellis, of Manchester and Harrogate, builder, who died on November 21 last, left estate which has been valued at 161,474*l.* 4*s.* 5*d.* gross, with net personalty nil.

Mr. Alexander C. Humphreys, the newly elected president of the Stevens Institute of Technology at Hoboken, U.S.A., is a native of Edinburgh. The Stevens Institute is a special school of mechanical engineering, and has produced nearly a thousand graduates.

The Seventh Exhibition at the Whitechapel Art Gallery is to be opened by the Duke of Fife, at half-past three on March 19. The exhibition is to be one of contemporary British art.

The Birmingham City Council lately appointed a committee to advise on the subject of the tramways. The report recommends the acceptance of an offer received from the British Electric Traction Company for the leasing of existing lines and proposed new lines.

The Committee for the erection of Emile Zola's monument have offered the commission to M. Constantin Meunier, a Belgian sculptor, who has gained reputation by figures of labourers. The latter hesitates to accept it through fear the arrangement may not be pleasing to French sculptors.

A Design by M. Deperthes, architect, and M. P. Roussel, sculptor, has obtained first place in the competition for the monumental fountain to be erected in Rheims out of funds derived from a legacy of the late M. Subé.

Mr. Windsor Fry will give four illustrated lectures on "The Art of Book Illustration" at Leighton House on the four Wednesdays in March, at 5 P.M. each day.

Sir Henry Burdett will open a discussion at the Caxton Hall, Westminster, on March 3, before the Hospitals Association, on "Hospital Sites and Population in London: Ought any, and, if so, which, of the large hospitals to be moved from their present sites to new ones situate in (a) more congested districts or (b) the country?"

The London County Council have expended during the last thirteen years 1,925,000*l.* on asylum accommodation for pauper lunatics. This sum does not include the alterations to Hanwell Asylum, costing 66,840*l.*, and improvements and additions to other asylums.

The Arts Exhibition, Delhi, which was promoted mainly by Lord Curzon in order that European visitors might realise the condition of Indian art, will not be closed for some time, as it is believed the different sections will remain useful.

The Streets Committee of the Court of Common Council have proposed that, having regard to the general opposition throughout London to the Bill for the amendment of the Building Act, a representation should be made to the London County Council asking them to withdraw the measure and to arrange a conference with the Corporation and the Metropolitan Borough Councils to consider the whole subject, with a view, if possible, to a Bill being framed that will effect the object in view without needlessly oppressing property owners.

M. Trouillot, French Minister of Commerce, has received a deputation from the committee of the London International Exhibition of Appliances for Preventing Fire. The object was to decide on the measures to be taken by French exhibitors wishing to take part in the Exhibition. Representatives are to be sent by France to take part in the approaching Congress. A special committee has been formed in Paris to enable the provincial fire brigades of France to be represented in London.

A Timber Annexe of large size has been constructed on the north side of the Madeleine in Paris for the accommodation of the workmen engaged on the restoration of the church.

The Next Ordinary Meeting of the Society of Engineers will be held on Monday, March 2, at the Royal United Service Institution, Whitehall, when a topical discussion on "Road Traffic in and near Large Cities" will be opened by Mr. W. Worby Beaumont, past president.

M. Marcel Proust has completed a translation of Mr. Ruskin's "Bible of Amiens."

Mr. W. Beattie Brown, Jun., of Edinburgh, has been awarded the Alexander Thomson travelling studentship of 60*l.* and Mr. A. D. Nicholson, of Glasgow, one of 20*l.*

The Estate of the late James Foster Wadmore, architect, of London, has been valued at 15,959*l.* 15*s.* 4*d.*

Mr. James Smart, who practised as an architect in Perth for about twenty years, died on the 22nd inst. in his fifty-sixth year. Among his buildings was the Coupar Angus town hall. He was also a member of the Town Council and other public bodies in Perth.

The next Examination for certificates of qualification for appointment of sanitary inspector, or inspector of nuisances under section 108 (2) (d) of the Public Health (London) Act, 1891, will be held in London on Tuesday, May 5, and the four following days. Particulars will be forwarded on application to the hon. secretary, Mr. Wm. R. E. Coles, 1 Adelaide Buildings, London Bridge, London, E.C.

Mr. Robert Lawson, architect, of Dunedin, New Zealand, has died lately. He was a native of Newburgh, Scotland, and was a pupil of the late Andrew Heiton, in Perth. He designed about fifty churches and many Government buildings.

The Congress of the Sanitary Institute will commence on July 7 in Bradford.

THE

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

ANSWER TO CORRESPONDENT.

"VERITAS."—We are of opinion that you have no claim against the tramway company. The only claim which you might have is one for damages occasioned by deterioration in value of the property, and so far as we can tell it would be impossible for you to prove these damages.

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 15,000l. Premiums of 60l, 25l and 15l will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

CASTLEFORD, YORKS.—March 31.—Designs are invited for a free library. Premiums 15l and 10l respectively. Mr. H. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—March 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums of 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 E. Aston Street, Wycombe.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60l and 30l are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—March 15.—Designs in competition are invited for a memorial of the Hull soldiers who fell in the South African war. Mr. E. Laverack, town clerk, Town Hall, Hull.

HULL.—March 31.—Designs in competition are invited for extension of the town hall. Premiums of 300l, 200l and 100l are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000l. CATHEDRAL SERIES: WORCESTER.—CAPITALS IN SOUTH TRANSEPT. THE CRYPT.

CROMER.—March 2.—For improvements to the Cromer West Cliff, including the construction of a shelter, paths, stairs, &c. Mr P E. Hansell, clerk, Offices of the Cromer Protection Commissioners, Cromer, Norfolk.

ECCLES.—March 16.—For supply of the following goods for the year ending March 31, 1904:—Setts (lonkey, paving, crossing, grit, no granite), flags (natural and concrete), flags (manhole, lamp-eye and gully), kerbs (straight and circular), channel stones (straight and circular), pitch, creosote oil, tar, prepared tar, limestone (broken to various gauges), limestone cubes and chippings (various sizes), granite macadam and chippings (broken to various gauges), castings, pit or river gravel. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

KIVETON PARK —March 7.—For supply of the best broken flag for roads, to be delivered between April and October 1903. Mr. P. Evans, surveyor, Council Offices, Kiveton Park Station, Sheffield.

OPERATIONS for introducing the new power have been commenced at Berwick. The builders have taken in a considerable part of the old shipyard as storehouses, &c., with a river frontage of over 100 feet. Only the necessary accommodation will be erected on this space, and ground reserved for anticipated developments. Only a certain number of the principal streets are included in the original lighting scheme, but applications have come from occupants in others and from the residential properties in the suburbs. The work of fitting the connections will be begun without delay.

A HULL INDUSTRY.

THE recent outcry against the conservatism of the business methods of British manufacturers, their slowness in adapting themselves to the changing conditions and methods of supplying the markets with their products, their cautiousness in adopting improvements in plant, machinery and labour-saving devices for handling both raw materials and work in course of manufacture, was one that had less ground for the somewhat hysterical cry of "Wake up, England!" than the general public imagined. At the same time, it must be admitted that the discussions on the subject had this good effect, that it caused our manufacturers to realise the necessity of looking forward, and not resting content with holding the present standard of excellence, and stirred them to a determination that if anything was necessary to insure the continuance of the superiority of British manufactures, at all costs it should be accomplished.

To one trade, at least, however, this charge hardly seems justified, namely, the Wood-Working Industry, for one improvement after another has been so promptly adopted, both in machinery and methods of handling, that a properly equipped sawing and moulding mill might almost be cited as an object lesson of the manner in which the maximum of output with the minimum of labour can be obtained.

We recently had the opportunity of inspecting the Humber Sawing and Moulding Mills, Hull, owned by Messrs. Beecroft & Wightman, Ltd., and believe a description of them will justify our remarks, and also prove of interest to our readers.

A matter of the utmost importance must necessarily be the position in which the mill is situated, having facilities for bringing the cargoes of timber to the mills, and for despatching from them the finished work. In these respects the Humber Mills, which cover an area of over five acres, are exceptionally placed, a siding of the Hull and Barnsley Railway running on both sides, the cargoes being loaded into the trucks at the docks, and delivered direct to any desired part of the mills, where they can be immediately placed in the sawing machines, and the trucks taken round the mill to the other side to receive goods ready to be forwarded to any part of the United Kingdom.

Before the wood is further dealt with it is necessary that it should be thoroughly and properly dried—gradually effected at an even temperature. Adjoining the mill is the dry house, a large brick building of four storeys, each floor measuring 91 feet by 44 feet, the ground floor arranged to receive long

BRITISH MANUFACTURE
HIGH-CLASS ENAMELS
For all DECORATIVE WORK.

"O" QUALITY "INDIAN" QUALITY
FOR INSIDE USE. FOR OUTSIDE USE.

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c., is directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.
EASY FLOW AND MANIPULATION UNDER THE BRUSH.
ENORMOUS COVERING PROPERTIES.

AND SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

SPINALL'S ENAMEL, Ltd. New Cross, London, S.E.

stuff, the second storey for 16 feet and under, the third for oak boards, and the fourth for doors, &c. The loads are taken inside to the hoisting apparatus, which carries one standard at a time on a trolley, and on reaching their floor are wheeled direct to their proper position and crosspiled and lathed, where they remain until thoroughly dried. The building is heated throughout by steam, and a uniform heat maintained, insuring that all wood before being worked up is in a thoroughly dry condition, without which it would be impossible to obtain the satisfactory results that are accomplished at these mills.

The sawmill, which is over 200 feet in length by 90 feet wide, is thoroughly equipped with modern machinery embodying the latest improvements, and contains twenty-three sawing, planing and moulding machines, including two large drag sawbenches to cut logs up to 15 inches deep, four ordinary deal sawbenches, three double planing and moulding machines, nine single planing and moulding machines, which, on the occasion of our visit, were making architraves in oak, 1½ inches by 6 inches, and cutting window sills, planed and grooved, at the same operation; one large single planer capable of working timber 6 by 14, or turning out match-boarding planed, grooved and tongued complete; a double planer taking two boards at a time, with an output of seven standards a day, and also general joinery and other machines.

All these machines are fitted with ducts through which the chippings and refuse are conveyed by a large cyclone propeller direct to the furnace at the power-house, which is automatically fed, the refuse providing practically the whole of the fuel required for generating steam for the works, and for driving the necessary machinery for the electric light, which is in use throughout the mills and offices. We may here mention that a special building is devoted to keeping the saws and cutters, of which there are an enormous number, and is fitted with saw-setting and tool-cutting machinery in charge of an efficient staff.

Messrs. Beecroft & Wightman, Ltd., hold very large stocks of architraves, mouldings in oak and redwood, doors, windows, &c, electric-wire casings, special floorings in various widths and sizes, deals, battens, boards, &c, consisting of over 3,000 standards; and they are also large importers of mantles, &c. We cannot speak too highly of the work we inspected, and the large and increasing output of the mills confirms our good opinion.

The set of room mouldings to match, "the Harrogate pattern," are excellent, and were used exclusively at the Hôtel

Majestic, where the firm also supplied 300 yellow pine doors 7 feet by 3 feet.

Messrs. Beecroft & Wightman, Ltd., also make a special feature of sawing Jarrah-wood into blocks, the whole of the wood used by the Hull Corporation for road paving being entrusted to them for sawing. We have no space to mention the extensive storing sheds, timber yards, or joiners' shops, nor to refer to the firm's large inland mills and yard at Bradford covering an area of 4½ acres, but have said sufficient to give our readers some idea of a modern sawing and moulding mill fitted with the best of the latest machinery, and that the result is work of the best character will be easy for them to satisfy themselves.

MARCH MAGAZINES.

"THE MAGAZINE OF ART" for March contains much of interest to the lover of art. "The German Emperor's Collection of French Paintings," "British Arts and Crafts in 1903," "Belgian Art of To-day," "Indian Art at Delhi," &c., all profusely illustrated.

The *Pall Mall Magazine* for March is as usual full of interesting letterpress, and contains an interesting illustration of the Prime Minister's Scottish home.

The *World's Work*, the new monthly edited by Mr. Henry Norman, M.P., and published by Mr. William Heinemann, contains some specially interesting articles in the March issue. The article entitled "Glasgow, the Second City of the Empire" is particularly readable, and contains some good illustrations. Also an illustrated article on Dr. Mond's new system of producing gas.

NEW CATALOGUES.

MESSRS. R. H. & J. PEARSON, of Notting Hill Gate, have just issued a new and eminently businesslike catalogue descriptive of their extensive stock of close and open fire kitchen ranges, improved portable or self-setting ranges, registers, grates, mantel registers and interiors, wood mantels, tile hearths, fire brasses, curb fenders, warm-air stoves, railings, gates, sanitary goods, electric-lighting fittings, electrical heating and cooking apparatus, gasaliers and gas-fittings. It is well illustrated, and all prices are given. A smaller list does with paints, oils, varnishes, brushes, &c.

“VELURE.”

OUR attention has recently been called to an enamel paint produced by Messrs F. Chancellor & Co, of 13 Clerkenwell Road, who claim for it an exceptional measure of elasticity and covering power. We have seen numerous testimonials which have from time to time been received by Messrs. Chancellor & Co., and they are unanimous in praise of “Velure.” It has been used with entire satisfaction in a number of public buildings, including such important institutions as London Hospital and Middlesex Hospital, baths and washhouses, swimming-baths, sanitary and other municipal buildings, large hotels, laundries, &c., as well as numerous yachts, where its great wearing power and sanitary properties are now gaining recognition; in explosive factories (as Messrs. Nobel’s) and important chemical laboratories (as Messrs. Burroughs, Wellcome & Co) It has been used with satisfactory results on the King’s estate at Sandringham and on His Majesty’s yacht, the *Victoria and Albert*; on the East Indian and Canadian and Brazilian railways and in the Royal Indian Marine. “Velure” is made in 120 colours, and it is claimed for it that surfaces coated with it may be exposed to sun or frost without fading or peeling, hammered without crumbling, bent without cracking, or baked or boiled without blistering.

TRADE NOTES.

WE regret very much that owing to a clerical inadvertence a reference in our last week’s “Index to Advertisers” was made to Messrs. Minton, Ltd., which should have been to Messrs. Minton, Hollins & Co., whose advertisement occupied the back page.

THE Blackpool Corporation new stables are being ventilated by means of a number of Shorland’s patent ridge ventilators, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. ANDREW HANDYSIDE & CO, LTD., of Derby and London, makers of steel bridges, roofs, buildings and structures, have received the contract for the supply of the roofing, &c., for a new station at once for the Buenos Ayres Western Railway Company.

THE London Fireproof Plate Wall Company, Ltd., are bringing out a new price list which, in addition to the ordinary description of the plates, contains also a number of copies of

testimonials from architects, builders, &c., who are unanimous in their expressions of satisfaction with the goods supplied to them.

MR. SAM DEARDS, of Harlow, has just exported some 14,000 feet super of his patent self-locking glazing for glass-roofing to Mexico for the new electric tram car sheds; a short time back a similar order was received for Cape Town. The system of patent glazing supplied by Mr. Deards is simply and easily fixed; unskilled labour can be used. The orders were placed for both places in consequence.

WE understand that Messrs. Woodforde & Wing, of Stamford, who are working the Edithweston freestone quarries, have recently taken over the Peasenhurst quarries, near Ashover, lately worked by Mr Robert Simpson. Entirely new and modern machinery is being laid down by the proprietors, who are already obtaining blocks of remarkable dimensions. The stone is supplied at an extremely low price, and is hard and durable. Everything necessary is being carried out so as to avoid any delay in executing orders.

VARIETIES.

THE Bishop of Southwell opened a new church at Holloway Notts, for the recently sanctioned parish of Dethick Lea and Holloway. The building has cost 4,500*l*.

THE deputy town clerk of Bolton (Mr. Joseph Henry Field, LL.B.) has been appointed town clerk of Huddersfield at a commencing salary of 800*l*., rising by sums of 50*l*. annually to a maximum of 1,000*l*. a year.

THE newly erected Baptist church, in Devon Crescent, Ilkley, the first meeting-house of the denomination in Wharfedale, was opened on the 19th inst. The site and building, which has been erected on the central hall plan, has cost 4,000*l*.

THE ceremonial opening of the new offices of the Farnham Urban District Council in South Street, Farnham, Surrey, which have now been in partial use for some time, took place last Friday in the presence of a large gathering of the principal residents, who attended on the invitation of the chairman and members of the Council. The ceremony was performed by His Grace the Archbishop of Canterbury.

QUOTATIONS FOR CASTINGS.

BLACKPOOL'S second Board school, in Devonshire Road, was opened on Wednesday. Mr. Gill said the Board was in its dying moments, and he hoped the new authority which superseded it would look well to the education of the future generation, without unduly taxing the present generation. During its three years of existence the Board had commenced three large Board schools at a cost of 60,000*l.* The Board schools in the town accommodated 3,113 children, the voluntary schools 3,491, and there were still 2,000 children who were in need of school places. The new school has cost 19,150*l.*

THE third of a series of lectures on "The Building of a House" to the members of the Edinburgh Architectural Association was delivered by Mr. A. Hunter Crawford, F.R.I.B.A., the president, in the Association's Rooms, 117 George Street, on the 18th inst. Mr. Crawford dealt at the outset with the building of the walls of a house, which he illustrated by photographs, and followed the construction from the wall head to the completion of the roof, giving details of the carpenterwork, plumberwork and the tiling. On the motion of Mr. W. M. Page, seconded by Mr. Henry F. Kerr, Mr. Crawford was awarded a vote of thanks.

AT the rooms of the Northern Architectural Association, Northumberland Street, Newcastle, last week, there were on view the Royal Institute of British Architects' annual selection of prize drawings, together with the intermediate and final examination testimonies of study. The works, which were highly appreciated by a very large number of visitors, included the following:—Two measured drawings for the Royal Institute silver medal, by Mr. Andrew Rollo, awarded the medal and 10 guineas; design for a town church, four strainers, by Mr. Edwin F. Reynolds, awarded the medallion and 10*l.*, and by Mr. L. Rome Guthrie, two strainers, awarded medal of merit and 10 guineas; the Tite prize design for a pavilion in a public garden, two strainers, by Mr. David Smith, awarded the certificate and 30*l.*; the Grissell gold medal design for a stone dome for a *porie cochère* to a large public hall, two strainers, by Mr. J. B. Fulton, awarded the medal and 10 guineas; and testimonies of study, eighteen sheets, drawings by Messrs. A. C. Bossom, J. L. Fouracre, William Heywood and S. Warwick.

A SCHEME for applying business methods to church matters has been submitted by the Rev. E. F. Crosse, vicar of St. Luke's, Barrow-in-Furness, and son of Canon Crosse, of Norwich Cathedral, to the St. Luke's parishioners. The present Sunday-school buildings have to come down for road

improvements, and are also inadequate to meet the requirements of the rapidly increasing population in the Salthouse district of Barrow, and 2,500*l.* being required to erect new buildings, a limited liability company is to be formed, and 2,500 *l.* debenture shares, to bear interest of 2 per cent., will be issued to parishioners, and the ordinary shares will be held by the vicar of the parish and six other prominent churchmen in different parts of the country. The buildings will be held by a trust deed, and as ordinary shareholders can buy up the debenture shares by giving three months' notice to the holders, the new schools and men's institute will rapidly become the property of the church. One great point in the scheme appears to be the fact that building can be commenced at once. Mr. Crosse is confident of success, and already many applications have been made for debenture shares, full recovery being guaranteed.

AT Westfield, Norfolk, on the 19th inst. the parish church was reopened after undergoing extensive restoration. The works comprise three new principals, new cladding and half new slating to the roof. New troughing and down pipes were fixed, the water being carried away by a drain to the adjoining field. A new stone coping and cross were fixed on the east gable, and coping where requisite on the west. A new window of cathedral glass has been fixed on the south side. The tower has been completely restored, and four new pinnacles fixed at the angles. The interior has also received attention. The walls have been newly coloured, and the bench heads and seats cleaned. The Communion rails have been freed from their coating of paint, thus showing the grain of the oak of which they were made. The floor of the sacarium has been partially raised and paved with red encaustic tiles, with a green and black border. A large tortoise stove has been erected with pipe carried through the roof. The font still needs repair especially at the base. Some 40*l.* are still needed to complete the work. About 300*l.* have been spent. The work has been carried through under the direction of Mr. A. J. Lacey, architect of Norwich, by Messrs. J. Springall & Sons, of Dereham and Swanton.

AT the adjourned licensing sessions, the Bench passed the plans for a very extensive addition and the practical rebuilding of the Queen's Hotel, Rhyl. The property has been acquired by the Rhyl Property Company, and Mr. Biddescombe, of Manchester, explained to the Court that between 5,000*l.* and 6,000*l.* will be spent on it.

BUILDING AND BUILDERS.

a meeting of the building committee, the plans for the proposed new church and hall at Burton Wood, submitted by C. E. Deacon, of Liverpool, were, with the approval of the Bishop and patron, provisionally accepted. It is proposed to proceed with the minor of the two buildings as soon as the estimated expenditure reaches 1,500*l.*, which it is hoped it will by Easter.

A SCHEME is under consideration for the restoration of St. Peter's Church, Wallingford, Berks, of which Judge Blackstone, on his death was interred in a vault at the east end of the church, took a leading part in the rebuilding in the year 1769. The plans provide for an apsidal chancel, a vestry and organ chamber, a heating apparatus, and an open oak roof. The estimated expenditure is 1,500*l.*

AT a recent meeting at Barrow in connection with the Wesleyan extension scheme, which comprises the building of a large hall and two new churches, one in Vickerstown, it was decided that the total cost would be 11,250*l.* Towards this sum grants had been made amounting to 5,375*l.*, including 1,500*l.* from Mr. Walker, of Whitehaven, being 500*l.* for each part of the scheme, 1,000*l.* placed in the hands of the Rev. Dr. Pope for building schemes, 1,700*l.* from the Twentieth Century Fund, and 250*l.* from the Chapel Building Fund.

NEGOTIATIONS have been practically completed for the purchase of a site for the erection of the King's sanatorium. The locality selected is near Haslemere, a beautiful stretch of partially-wooded land standing over 600 feet above sea-level, and within a short distance of Hindhead Common. The site is considered by authorities on tuberculosis to be one of the best for the purpose obtainable in England. On this site, which is 125 acres in extent, will be built a palatial hospital on lines similar to those employed with great success on the Continent. There will be a hundred beds in the hospital. The majority of these will be set apart for necessitous patients, who will pay a nominal fee. The remainder will be placed at the disposal of others who may desire treatment in the sanatorium. From this class of patient a larger fee will be asked, perhaps five pounds per week, the rate current in some of the best man institutions.

A MEETING of the members of the Edinburgh Building Trades Exchange, Ltd., was held on the 19th inst. in the rooms 26 George Street, Edinburgh, Sir Thomas D. Gibson, Bart., presiding. A lecture was delivered by Mr. Henry F. Kerr, his subject being "A Glimpse of some of the

great Mediæval Churches of Britain." In the course of his lecture, which was illustrated by limelight views, Mr. Kerr referred to the current of architecture from Egypt to Rome. For the greater part the lecturer dealt with the plan of our great Mediæval churches founded upon the Roman basilica, and afterwards he described in some detail the various churches of Great Britain, such as Durham, Salisbury, Peterborough, Elgin, Canterbury, York and Melrose. In moving a vote of thanks to the lecturer, which was heartily accorded, the chairman spoke of the benefits to be derived from such lectures. He urged the members to attend all the meetings, as he believed that by assembling together occasionally all those connected with the various branches of the building trade would profit considerably.

THE prospect of obtaining large grants from the Million Guinea Fund has led, says the *Manchester Guardian*, to a remarkable development in Wesleyan Methodist chapel building. Since it has been known that the Connexional Chapel committee was prepared to commence the distribution of the 300,000*l.* allotted to it by the Conference for chapel building purposes the officials at the headquarters have had a busy time receiving and considering applications. Including the February returns, the number of applications dealt with exceeds 600. Grants have been made in 597 cases. Supposing the erections to extend over two years, that means that a new Methodist chapel or mission-hall will be opened every day for the next two years. The total outlay on schemes already sanctioned amounts to 1,841,177*l.*, and at the rate the applications are coming in the total expenditure sanctioned will soon reach two millions sterling. To the cases already sanctioned the committee have made grants amounting to 207,129*l.* The Manchester district is responsible for fourteen applications, involving an expenditure of 53,805*l.*, and secures grants amounting in the aggregate to 5,268*l.* Bolton district makes twenty-seven applications, proposing to spend 120,440*l.*, and secures the promise of 13,785*l.* in grants. Liverpool district has relatively a small number of applications for so large a district, the total proposed expenditure being 58,728*l.*, and the grants 7,160*l.* The Macclesfield district makes sixteen applications, the total outlay being 18,204*l.* and the amount of grant voted 1,985*l.* The first London district secures the first place in the amount it proposes to spend, namely, 196,802*l.*, towards which the committee has promised 19,245*l.* The Birmingham district is a good second. Its new schemes involve an outlay of 171,051*l.*, and to these 19,163*l.* is promised

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and Country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

in grants. The Nottingham district holds the first place in the number of applications made, but is outstripped by Newcastle-on-Tyne, Third London, and Bolton in the amount proposed to be spent and in the grants secured from the Twentieth Century Fund. The smallest amount voted to any one district is 260*l.* to the Channel Islands, where it is only proposed to spend 2,707*l.* on three cases.

THE ARCHITECTURAL SOCIETY OF IRELAND.

A MEETING of the Architectural Society of Ireland was held on the 17th inst. in the Grosvenor Hotel, Dublin. Mr. F. J. Hicks presided.

Mr. W. Kaye Parry, M.A., read an interesting paper on "Fireproof Floors." He said that whatever might be the differences of opinion regarding the merits of the various materials for fireproof or fire-resisting floors, it could not be denied that the ordinary timber floor left much to be desired. Whilst improvements in the methods of construction of human habitations had been numerous in other directions, architects and builders displayed a tendency to cling to the old-fashioned floors. Little could be said in favour of timber floors, except that they were so simple as to come within the knowledge of the veriest tyro in construction, and so cheap as to form an irresistible allurements to the economist and to the jerry-builder. Mr. Parry proceeded to refer to the distinctions between ordinary fireproof floors and the more complete and more costly fire-resisting floors, and he mentioned the experiments which had been made with a view to securing a satisfactory description of a fire-resisting floor. A floor, he said, to be a real fire-resisting one should have the girders encased in a fire-resisting material.

On the motion of Mr. Beckett, seconded by Mr. Patrick O'Sullivan, a warm vote of thanks was passed to Mr. Parry for his interesting paper.

ROYAL HIBERNIAN ACADEMY.

ON Monday a deputation representing the Royal Hibernian Academy waited on the Lord Mayor and Corporation of Dublin for the purpose of obtaining their support in favour of the reconstitution of the Independent Chartered National Guild of Artists, and the procuring of a site for a new academy.

Sir Thomas Drew, president of the Royal Hibernian Academy, said he wished to express his sense of the Lord Mayor's courtesy in inviting and encouraging a visit of deputation of the Royal Hibernian Academy of Arts, and permitting the time of the Municipal Council to be taken from the business in hand to be occupied by a subject which it brought to the attention of the citizens. The action of his lordship only carried out that traditional courtesy which had been always his privilege to receive during years of citizenship in Dublin from every officer—from lordship's predecessors in high office, and all subordinate officers. It was right that the Chartered Guild of Artists representing the interests of art culture in modern and contemporary art should move to address the Corporation of Dublin on a movement stirring in nearly every city and town of England and Scotland for the culture and enjoyment of the people at large, by art exhibitions' annual and permanent. Dublin was yet behind in such a movement. The Academy of Arts had been for 70 years the sole exponent of contemporary art in a partial and inadequate way by maintaining, with quite insufficient means and with struggles and self-sacrifice of its members, annual exhibitions of contemporary art for two or three months in each year. It was a national institution, and with Imperial claims no less than the Academies of London and Edinburgh. It had been treated with comparative injustice and neglect, with hostility from inferiors and with departmental English officialdom. Nevertheless, with all discouragements, it had not failed in duty to the Dublin public since Francis Johnston, citizen of Dublin, founded it with the modest endowment of a building in Lower Abbey Street in 1826. A very favourable opportunity had arisen to stir this whole question. A wave of interest and enthusiasm for art had broken out in Dublin, a winter exhibition of old masters, from old Dublin mansions, at the Academy, accomplished by the energy and knowledge of Mr. Hugh Lane, had been popular beyond belief. Therefore they seized the opportunity to bring before the Council the incumbent municipal duty, recognised elsewhere, to bring about better permanent conditions for culture and education in modern art. The public spirit with which the Dublin Corporation had, in spite of its poverty and burdens, recognised its responsibilities towards the art of music and technical education, convinced him that the provision for fine arts, respectfully suggested by the Corporate Guild of Artists, would receive every consideration. This appeal of theirs was not for their own candidates especially, but in the cause of contemporary art and the means

culture in it which were wanting in the cities of Ireland. A national academy, as in the capitals of England and Scotland, which claims on Imperial support, should receive encouragement and financial contribution from the purse of the Imperial taxpayer. He thought the treatment that the Irish Academy had received made this the time to come to the bar of Irish public opinion, and where more fittingly than to the bar of the Corporation of Dublin? He contrasted in detail the provisions made from the Imperial purse for the Academies of London and Edinburgh with the niggardly treatment of Dublin. They urged for the support of public opinion that could not be obtained in support of a reconstitution of the Independent Incorporated National Guild of Artists, a re-chartering of it subject to no condition or limitations not known in the sister Academies, absolutely home-ruled and autonomous by a body of living artists in touch with living artists outside it, by which the living and contemporary art could be brought to the notice of Dublin. The Government were now proposing to acquire by Act of Parliament a large piece of land for science and art purposes. A little extension of that scheme would secure not only what would be sufficient for a site for a new Academy, but for a municipal art gallery. Sir Thomas Drew, in conclusion, urged the establishment of a municipal art gallery in Dublin, and pointed out what had been done in this direction in a large number of English towns. The Lord Mayor said he thought he spoke for the whole Council when he said that he felt humiliated that they should be unable to make some efforts for art such as were made by English communities. There were statutory difficulties in the way of using their funds, but the subject had been before the minds of the Council for a very long time, and he thought he could pledge the Council to gladly second any efforts made by the Academy. He thought they had a very great grievance in this country when they compared the small sum of 300l. with the generous assistance given elsewhere. He was sure if it was agreed that this Society should call on the Chief Secretary or the Lord Lieutenant a deputation of the Council would be very glad to accompany them. He did not know whether any resolution would be submitted, but he was sure the whole Council would assist the deputation in any way they could.

In the course of a short discussion which followed, sympathy was expressed with the object of the deputation, and Mr. Beattie said he thought the Academy had been treated unfairly.

The Lord Mayor, in conclusion, said he should be very glad to get representatives of the Council to accompany him on any deputation to the Chief Secretary or the Lord Lieutenant with a view to bringing the matter before them.

The deputation then withdrew.

THE SURVEYORS' INSTITUTION.

THE annual dinner of the Surveyors' Institution was held on Friday night at the Trocadéro Restaurant, Piccadilly Circus. Mr. Arthur Vernon (president of the Institution) occupied the chair, supported by Lord Sandhurst, Lord Cottesloe, Lord Addington, Sir J. Rolleston, M.P., Mr. Coningsby Disraeli, M.P., Mr. Jesse Collings, M.P., Sir R. D. M. Littler, K.C., Sir T. H. Elliott, Sir T. Brooke-Hitching, Mr. Grenfell, M.P., Archdeacon Sinclair, Sir Henry Howse (president of the Royal College of Surgeons), Mr. Aston Webb and Judge Rentoul.

The loyal toasts, proposed by the Chairman, having been received, Mr. Charles Bidwell (vice-president) gave the toast of "The Houses of Parliament."

Lord Sandhurst replied for the House of Lords, and mentioned that he was the only peer who had nothing to do with land surveyors in any shape or form. The only land property he possessed was the flower-box in front of his dining-room window.

Mr. W. H. Grenfell, M.P., replied for the House of Commons.

Mr. E. Stafford Howard submitted "The Landed Interest," and said that, taking the land question as a whole, it was pleasant to find that the relations of landlord and tenant in this country were so satisfactory. If they wanted to get the labourers back to the land and keep them, they would have to give them good wages and provide comfortable homes. There was no use in asking Parliament to interfere any further in the matter.

Mr. Coningsby Disraeli, M.P., in response, said that this question of landed interest dealt with the greatest industry of the country. It affected the tenants, labourers and, he might even say, the Church.

Sir John Rolleston, M.P. (past president) proposed "The Bench and Bar," to which Judge Rentoul and Sir Ralph Littler replied.

Mr. Jesse Collings, in giving the toast of "The Surveyors' Institute," said it was a wonderful Institution, and it now had between 3,000 and 4,000 members. That the management of the land should be governed by the best advice was the hope of the country, and there was no other foundation for the permanence of a nation than the land.

The President stated, in response, that they believed that their Institution was yearly becoming more representative of the profession. For the good of the profession and the advantage of the public, they were pursuing what they considered the right path, and the landowners of the country would benefit. What they wanted was to give assistance to the overcrowded cities and relieve congested traffic, and make everything as pleasant as they could.

PLUMBERS' RULES IN LIVERPOOL.

THE Secretary of the Liverpool Master Builders' Association writes:—

As you are aware, differences of opinion have arisen between the Liverpool Master Builders' Association and the United Operative Plumbers' Association with regard to the following questions:—

1. The men allege that the proper place for taking on men is the master's place of business, and not on the job, while the masters contend that they are at liberty to take on a man either at the master's place of business or on the job.

2. The men allege that where a man is engaged at the shop and is discharged at the job, wherever the place of payment may be, his time and expenses are to be paid as if he were discharged at the shop instead of on the job, while, on the other hand, the masters allege that though a man is engaged at the shop, if he be paid and discharged at the job payment is to be made only up to the time of such discharge.

The first dispute has been going on for something like eighteen months, and the second took place about three months ago, resulting in a lock-out. Both these questions were submitted for final decision by the mutual consent of the two associations concerned to Mr. Joseph Hamilton Glover, solicitor, of 60 Castle Street, Liverpool, as arbitrator. The following undertaking was signed by the presidents and secretaries of the respective associations:—"We also hereby agree on behalf of the members of our respective associations to be bound by your decision in both cases in future so long as

the rules relating to the matters in dispute shall remain in force as at present."

Mr. Glover, after a very lengthy hearing, took time to consider his decision, and has now given his award, which is as follows:—

1. "As to the first point submitted to me, I find and award that a master may take on or engage men for work either at his shop or place of business or at a job."

2. "As to the second point submitted to me I find an award that where a workman is engaged at the employer's shop, but is discharged at a job (except a country job), wherever the place of payment may be the workman shall be paid down to the time of such discharge only." Mr. Glover also ordered that the costs should be borne in equal shares by the respective associations.

It will therefore be seen from the above award that the employers were right in their contention with regard to both questions, and that it is now clearly laid down as follows:—

(1) That an employer is entitled to take men on at a job, and when he does so he only has to pay such men the rate of wages for the district—no expenses at all. (2) That when a man has been sent from the shop, but paid and discharged at the job, the employer need not pay him for taking his tools back to the shop, the man only being entitled to be paid up to the time of such discharge.

EMPLOYERS AND LABOUR LEGISLATION.

At a conference of representatives of employers' associations connected with the various interests in the United Kingdom held under the auspices of the Employers' Parliamentary Council at the Westminster Palace Hotel on Tuesday, the following resolutions were adopted, and steps were taken to give effect to them:—(1) "In view of the attitude of political parties towards industrial problems, of the growing strength of the Socialist Labour party upon local government bodies, and of the efforts of the Labour party in the House of Commons to promote legislation to nullify the effect of the recent legal decisions with respect to conspiracy and picketing, this conference of representatives of employers' associations connected with the various interests in the United Kingdom affirms the desirability of a closer and more effective combination of employers for the purpose of protecting the interests of trade

free contract and of labour against undue interference with interests on the part either of Parliament or of local authorities;" (2) "That this conference is of opinion that, independent of party politics, steps should be taken at all Parliamentary and municipal elections to insure that the views of employers are brought under the notice of candidates in order to the efforts of the Labour party to control Parliament and that governing bodies may be resisted; and this conference desires to impress upon employers' associations and upon individual employers the need for personal communications being addressed to their local members of Parliament with respect to all questions arising in Parliament affecting the relations of employers and workpeople;" (3) "That this conference of employers' associations, representing the chief industries in the United Kingdom, expresses its regret that Parliament has failed to appoint the joint committee on municipal trading, and declares that inasmuch as it is essential to the commercial and trading interests and to the progress of the nation that an exhaustive inquiry into the character and extent of trading by municipal authorities should be made without further delay, urges upon His Majesty's Government that a Royal Commission of inquiry be appointed to define the extent to which municipal trading should be sanctioned by Parliament, and further submits that the consideration of all provisions in local Bills for the extension of municipal trading should be postponed until the said Royal Commission has reported on the matters in question."

CHESTER IMPROVEMENTS.

The Duke of Westminster, through his agent, the Hon. Cecil Barker, has sent an important letter to the Mayor of Chester protesting against the Corporation's decision to seek to borrow money on the security of the rates to build workmen's houses. The letter states that philanthropy is commendable, but not when money is taken out of other people's pockets against their will. His Grace is assured there is no real lack of housing accommodation in Chester to make it necessary for the Council to embark on housing speculation at the ratepayers' risk. Since the Council have been committed to building cottages letting them at lower rents than are paid for similar houses in private ownership the policy," says His Grace, "will have to be followed until every so-called working-man, never good his wages, is supplied at the ratepayers' cost;

the consequences of course being not only a prodigious debt being piled up, but the levelling down of the rents of privately owned cottages, and therefore of the annual value on which the rates are raised, thereby increasing the rate in the £ not only on the present cottage owner, but also on property occupied by tradesmen and others, some of whom perhaps are not really better off than many of the so-called working-men and for whom no house can be provided out of the rates." His Grace thinks that if the rates are to be resorted to it should be for improving and in some cases abolishing existing slum cottages, of which he is informed Chester still has too many, and he for one would not complain of money judiciously expended out of the rates with the knowledge and approval of the ratepayers.

HOUSING IN GLASGOW.

A LECTURE on "The Structural Aspect of the Housing Problem" was given by Mr. A. B. McDonald, the city engineer, in the Berkeley Hall, Glasgow. He began by giving an account of the work done by the Corporation after the extension of the city in 1846 by the inclusion of the burghs of Calton, Gorbals and Anderston, when a sum of 30,000*l.* was devoted for the purpose of eliminating some of the worst plague spots in High Street, Gorbals and Calton. He also noticed the labours of the health committee appointed in 1857, of which the late Mr. John Ure was chairman. In co-operation with the late Mr. John Carrick, master of works, Mr. Ure stimulated public interest in the regulation of new buildings, the control of nuisances, the prevention of overcrowding, and other sanitary arrangements that were ultimately formulated in the Police Act of 1862, in which there appeared for the first time a statutory definition of the amount of space to be provided for each occupant of a dwelling, the cubic measurement being 300 feet to each adult person. This allowance of cubic space was increased by subsequent legislation to 400 feet, and this important statute, confirmed and amended, remained in operation as the Glasgow Police Act, 1866. Thirty years had elapsed since the more important of these improvements under that Act were carried out, so that the former state of things must to many persons be a mere second-hand reminiscence. But even among those who were old enough to recall the past, how few were there who could realise the narrow, tortuous Main Street of Gorbals, with its deep hollow between Puddock Row and Adelphi Street, now replaced by a spacious, level

street, 70 feet in width at its narrowest part, the narrow irregular line of Saltmarket, barely 30 feet wide, now broadened to 7 feet, debouching on Trongate, widened from 70 feet to 150 feet. And how few bore in mind the narrow ascent of the Bell of the Brae to the congeries of old rookeries in Kirk Street, Drygate Lane and Drygate, which had been cleared away and replaced by the amplitude of Cathedral Square, conferring on modern eyes the fine vista of the ancient fane that was denied to earlier observers. These clearances were begun about 1870, and as showing the benefit to the public health thus obtained he stated that the death-rate in Gorbals, which in 1871 was 38.5 per thousand, was now 28.3; Saltmarket, formerly 38.3, was now 23.3; and High Street had been brought down from 43.2 to 29.7. The improvements effected under subsequent statutes were also briefly sketched, and it was mentioned that if the Corporation were to exercise the powers conferred upon them by the Buildings Regulation Act of 1900 it would involve the closing up of dwelling-houses in which at the present time about 20,000 persons find accommodation. The class of persons who would be displaced was next noticed, and a description was given of the types of houses which should be provided for their accommodation, as set forth in the evidence given by the lecturer before the Housing Commission. The lecture was illustrated by a number of beautiful limelight views.

FALL OF A CHURCH TOWER, BANGALORE.

A CORRESPONDENT of *Indian Engineering* writes:—The tower of St. Mark's as a structural and architectural work was a very small thing indeed, only about 20 feet square and about 90 feet high. It formed the central portion of the transept of the church, and in its lower storey was thus well supported by the rooms on the sides; so that, however badly designed, this part of it was supported on four sides by the nave, transepts and apse, and could not fall. It was immediately above the first storey and at the base of the second storey that the tower toppled over. Here the shaft extended barely 60 feet in height, and with the four rooms already mentioned as a base to the shaft, it seems almost incredible that it should have been so badly designed as to fall immediately after construction.

The cause of failure seems to be the clumsy way in which the square section of the tower was turned into the octagon. Any number of large and small towers have been built in

Madras within the last ten years. Had the builder, without any other knowledge, but used a little observation, he would have known the correct way of getting over this difficulty. Architectural buildings, where, for ornament and structural effect, masses of masonry have to be concentrated at certain points, it requires the knowledge and the training to know how to arrange this, so that there will not be undue strain and stress at those points. All knowledge of this kind is conspicuous by its absence in the construction of the tower of St. Mark's, so though it is, showing that the builder was extremely careless or knew very little of his business.

I understand that this small tower is the first tower designed by Mr. Harris as consulting architect to the Madras Government. It has been already explained that his design was in opposition to that of the Commanding Royal Engineer. Had the design for St. Mark's tower fallen into the hands of a competent builder I feel sure that he would have quickly detected its defects and so altered its structural arrangement without destroying its architecture, that the tower would have stood as firm and as solid as good construction can make it, with all the beauties of copied architecture.

There are now so many and such beautiful illustrations of architecture, more than in any art, that it is very easy for an amateur to copy a pretty or a striking illustration, but what such a man fails in is the constructive part of the design. The details of construction cannot be copied, as these are very seldom published, and hence failure and collapse in construction, so that architectural constructive ability seems in actual work even more important than high architectural knowledge.

From inquiries made I understand that the construction of St. Mark's tower was entrusted to the Superintendent of Light houses during Mr. Harris's absence, one who has had experience in the construction of architectural designs, whose assistant, therefore, slavishly followed every constructive detail as best he could, with the resultant collapse. In a building life an architect is more prone to look to his architecture distinct from construction, and to give it the preference. An experienced builder then steps in, and does not alter the architecture, but perfects the constructive details, so that everything is stable and well balanced, without undue strain or stress, any one place or point and well tied all around.

If Lord Curzon's rule is to witness an architectural revolution all over India, these remarks will apply not only to the Madras Presidency, but to all parts of the Empire. Had the collapse at St. Mark's taken place a little earlier or a little later, many

ave soldier would have been buried in the debris, and there could have been a wail extending beyond the shores of India; I would warn those concerned to take these remarks in good th. The authorities should see to it that every Presidency s its well-trained architectural builders, who should be em- oyed on only this one particular line of work, and in whose nstructive ability the architect can place the fullest reliance. is will relieve the architect of a great deal of responsibility d give him more time to attend to the purely architectural e of his profession. The taking out of quantities, rates, ining of workmen for special descriptions of ancient and dern kinds of work, and a hundred other details so necessary a large architectural design, can be attended to by the itectural builder.

Indian workmen are a marvel when properly handled. ey have got all the natural artistic gifts of the Italian, with re of his patience and less of his temper. But this mine of ural wealth has been but little touched on—perhaps more in outh than in the north of India. The appointment of ultiing and provincial architects is but one step in the right ection. To produce the best results, a great deal more is uired. Trained workmen in all the ancient building arts of lia, and in all the modern arts of Europe, are necessary e material is available, and merely requires some sympa- tic hand to call it into life. Let us hope that the monstrosity mporting French and Italian mosaics, gildings and aldings, will for ever cease. It is an easy way by which e architects and architectural engineers obtain a false atation.

I am informed that the collapse of St. Mark's tower has ed the transepts and part of the body of that old church, at that the place in which the English worshipped from the s when Bangalore first became a British possession now ents a most gruesome sight. For political and many other ons this military church, in the midst of an independent ve State, should be speedily restored.

WORCESTER MASTER BUILDERS' ASSOCIATION.

Annual dinner in connection with the above Association held at the Hop Market Hotel on the 17th inst. Mr. J. Mage presided in the absence of the president (Mr. J. S. Wood) through indisposition.

The Vice-chairman having proposed the loyal toast,

Mr. J. Stokes (the hon. treasurer) gave "The Mayor and Corporation of Worcester." The city, he said, was extraordinarily well served by the Mayor and the Corporation. The Mayor, despite his business interests, was doing his duty nobly. The building trade was well represented on the Corporation, but all would agree that it was a loss to the city when their president, Mr. J. S. Wood, resigned his seat. The city of Worcester was growing and prospering, and they had only to look at the magnificent buildings which were being erected in its streets to see how much the Council was doing for them. The Corporation having provided every facility for the electric current, it was a great pity the company had not provided them with the more efficient service they needed, and had not put the portions of the roads belonging to them in repair. He hoped all that work would be done before their next dinner.

Councillor Parker, in reply, endorsed Mr. Stokes's compliments to the Mayor. Speaking of the Corporation as a whole, he said they were accused of extravagance, but they had to spend money if they were to keep the city abreast of the times. In the electricity undertaking some people were shocked that so much as 120,000l. had been spent. They had always hoped to make the undertaking a success, and he was pleased to be able to announce that the electricity committee, at their meeting on Monday, received the report of their engineer and the statement of accounts, and the latter showed a credit balance on the accounts for the year of 1,150l. That was after paying interest on sinking fund and other expenses. A great deal of the success of the undertaking was due to the work done by the engineer, and the committee recognised the value of his work and intended at the next Council meeting to recommend that a considerable increase be made in his salary, and that he be given a bonus. The committee would be accused of extravagance in doing this, but he believed it was an economical course to pay an officer well and retain the services of a gentleman who had done so much for the electricity undertaking.

The Chairman proposed "Success to the Midland and Local Federation of Master Builders." He said that the Federation, having been commenced after a hard struggle, hibernated for about twenty years, but for about five years it had been doing active work. It had gained a great many privileges and benefits for builders throughout the country. Having referred to the advantages they had derived from the "prentice rule," which the Federation had introduced, he said that in Worcester they were handicapped more than in any other city, perhaps, in the early days of the Association, but

now they were working hand in hand, and he was glad to see the men were working with them and they were working with the men. He spoke of the advantages which they derived through the workmen of the various trades all working during the same hours instead, as formerly, each during its own particular hours, and in the abolition of the restriction imposed by trade unions on imported worked stone. They did not wish to encroach on the interests of trade unions, but they intended to manage their own businesses in the way it seemed best.

Mr. A. Smith responded on behalf of the Midland Federation, and said he addressed them with special pleasure because his grandfather 70 or 80 years ago was a builder in the city, and his father was born under the shadow of the cathedral. He regretted that he was not able to meet Mr. Sharman Wood, for he recalled that the name of Messrs. Wood & Sons was well known years ago in his boyhood. Referring to the Association, he said it existed not as an aggressive body, but for the purpose of resisting unreasonable demands.

Mr. W. Phelps, replying on behalf of the local Association, said the membership of the Association had increased during the year by seven, making the total membership thirty-eight. The wages paid by the various employers during the year was 53,400%. They had had no disputes, and had just concluded by arbitration the rules with the plumbers. Notice had been given to the various employers in the Malvern portion of the Association to bring their rules into conformity with those of the Worcester part. A reply had been received indicating that the men could see the wisdom of adopting the same rules. He pointed out that the employers had been doing their best to regulate the work so that during the winter time there should be work for as many men as possible, having shortened the hours a little. He claimed that the Association had done a very good work in getting the rules adopted, and thought it would be for the welfare of the employers and employes. He concluded by thanking the visitors for being present.

Mr. J. Jones, in submitting "The Trade and Commerce of the City," said they were glad to think that Worcester had a fair share of the prosperity of trade generally. There was a variety of trade in Worcester, and if one trade was bad another was good, and so they never had such depression in Worcester as they did in other places. Worcester was a progressive city, and their object was to make their town attractive, so that people would come there to reside, and so anything that tended to make it beautiful they would welcome. They were

glad that during the past year there had been no great trouble between capital and labour, and he trusted they would be able to prevent any rupture of their present happy relations in the future.

Ald. Caldicott, in reply, spoke of the kindly feeling that existed between the trade and the streets committee. The commodities produced in Worcester were of the very best, and would compare favourably with any made throughout the kingdom. He was sorry he could not congratulate the building trade on being in a prosperous condition; especially as there was no doubt the building trade, more than any other, reflected the state of the other industries in the city. A new league had been formed in Worcester, but whether it was a social league or a teetotal league he was not in a position to say. It had been stated that the league was a body which was to make the city an ideal one. If that were so, they wished it every success. There was a wave of trade depression passing over the kingdom, and this was felt a little in Worcester, for there was shortness of work. He mentioned what had been done by the streets committee to meet the wants of the unemployed, saying that they had been put to the levelling of the Jew's Patch; the stoneyard had been opened, and thirty men had been at work there. If they could get that number of men willing to break stone at 2s. a load it showed that they were men who wanted work and were not loafers.

Mr. H. Stokes gave "The Architects of Worcester District," and said there was a much better understanding between the employers in the building trade and the architects. The latter were always ready to meet them in every way. The only thing he had to complain of was their zeal on behalf of their clients—and he also wished sometimes that they would give the builders better prices. He coupled with the toast the name of the representative of the oldest firm of architects in the city, Mr. A. B. Rowe.

Mr. Rowe, in response, said the architects were in sympathy with the Association, and congratulated the builders on their success. He did not think they were so down on the builders as Mr. Stokes would have them believe, and they always tried to meet them in every way. He concluded by congratulating them on the admirable work carried out at the theatre by Vice-chairman, Mr. Stokes, and the sub-contractors, Messrs. Santonna, Ward and Heath.

The Vice-chairman proposed the health of the chair to which Mr. Bromage briefly responded, and this concluded the toast-list.

ARMOURER FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London"

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

ALSO MAKERS OF THE ARMOURER URALITE DOORS. Full Particulars on Application.

**HOT WATER AND
STEAM HEATING INSTALLATIONS,
HIGH AND LOW PRESSURE. VACUUM SYSTEM.**

**GRINNELL AUTOMATIC FIRE EXTINGUISHING INSTALLATIONS.
FIRE PUMPS AND FIRE APPLIANCES OF ALL KINDS.**

MATHER & PLATT, LTD. Park Works, Manchester; & 14 Victoria St., London, S.W.
And at Glasgow, Leeds, Birmingham, &c.

The Architect.

THE WEEK.

AT the present time, when the subscriptions for the proposed Liverpool Cathedral are only slowly coming in, it must have been most encouraging to the committee when they received a letter from Mrs. ISMAY, the widow of the late T. H. ISMAY, offering a gift of 10,000*l.* to the building fund, together with a promise to provide the east window in the new building as a memorial to her husband. The following resolution has been adopted:—"That the offer of Mrs. MARGARET ISMAY to provide the principal window at the chancel end of the cathedral as a memorial of her husband, the late Mr. THOMAS HENRY ISMAY, one of Liverpool's most distinguished citizens, be accepted, and that there be reserved to Mrs. ISMAY or her representatives the right to provide such window according to a design to be furnished by her or them in due course and approved by this committee." By reserving to themselves the right of approval of the design of the window the committee have recognised their responsibility. Although money is desirable, it would be an unworthy means to obtain donations if they allowed people to imagine that the new cathedral would be let out in sections for memorials of wealthy people. An east window, assuming the style of the cathedral to be Gothic, is no insignificant gift, but only on condition of its not becoming too obtrusive a glorification of the virtues and riches of the defunct shipowner.

WHEN the committee were appointed for inquiring into the affairs of St. Bartholomew's Hospital we recommended promptitude in arriving at results. We pointed out as a warning the deplorable example of the Manchester Infirmary, where, after years of reporting, the investigation cannot be said to have come to an end. The Lord Mayor's committee of inquiry have displayed their capacity as men of business by arriving already at the following resolution:—"That, in the opinion of this committee, it is desirable in the public interest to retain St. Bartholomew's Hospital on its present site." There were fourteen votes in favour of the resolution and only one against it. The discrepancy is enough to demonstrate how easily discussions may be continued and the unwisdom of waiting for a lengthened period in the expectation of unanimity. The problem has now cost much of its indefiniteness, and the task before the committee, though still extremely onerous, can be mastered with patience and resolution. Two sub-committees have been formed, we are told, the first to deal with buildings and the second with administration and finance, in order to thoroughly investigate the best means of providing a hospital, perfect in every detail, and brought up to the latest requirements of modern scientific knowledge, on the present site of the hospital in Smithfield. These sub-committees will meet—the former on Mondays and the latter on Fridays—until their investigations are complete.

RELIGIOUS and political differences in Ireland are so unlimited in their operations, they can affect an architect's claim for fees. A few days ago an application was made to the King's Bench Division in Dublin to have the venue of the trial of an action brought by Mr. DONNELLY, an architect, against the District Council of Omagh, changed from Omagh to Dublin. He claimed 149*l.*, and the council lodged in Court 70*l.* Mr. DONNELLY had filed an affidavit in which he objected to Omagh because he said he could not obtain a fair trial there, for the members of the District Council were all Protestants, and it was alleged they were one-sided in dealing with Catholics. It was admitted, however, there were other grievances against the council in the town, and it might be supposed there was a chance of their obtaining a verdict in their favour as the plaintiff. Eventually, and in spite of plaintiff's objection, it was decided to change the venue to Londonderry. The case may not at first sight seem important, but it reveals one of the causes which prevent the arts from flourishing in Ireland. A Catholic artist cannot expect to find patrons among Protestants, and *vice versa*; indeed, it

has been known that even sewage schemes have been set aside because of the religion of the designers. This is an unfortunate state of affairs, for what is the use of acquiring technical skill if such remote causes as politics or theology become more influential than any competence to carry out commissions? The mere application for a change of venue is enough to excite a prejudice against the architect who is seeking his fees, and that must have been known by the Council when offering only half the amount due to him. The spirit is fortunately incomprehensible in England, but it is supreme in Ireland.

FRIENDLY relations between foreign cities or states are not likely to be promoted by making them rivals for the possession of works of art. Owing to her dissatisfaction at the expulsion of the princes, the Duchess of GALLIERA left a collection of pictures to the municipality of Genoa on the condition that if they were not properly preserved they should become the property of the city of Paris, in order that they might be exhibited in the Musée Galliera. It is needless to say that the state of the paintings is from time to time jealously scrutinised by French eyes. It was lately stated that the provisions of the will were not complied with, as some of the pictures had been restored in a careless manner. A commission was therefore formed consisting of directors of various public galleries in Italy. As was to be expected they have taken a different view of the operations. They declare that through the restorations the paintings are now more beautiful than ever. It remains to be seen what course will be adopted by the Paris municipality. Under such circumstances an appeal should be allowed to independent experts, for it is not to be presumed that Frenchmen or Italians could be entirely impartial.

WHEN his *Hypatia* appeared in the most prominent position in the large room of the Grosvenor Gallery, Mr. CHARLES W. MITCHELL by that single work became prominent, and was looked on as one of the most able among the young painters of the time. The nearly nude figure of the hapless teacher of philosophy standing at bay on the altar steps, with her arm uplifted towards the Cross behind her, was unquestionably tragically dramatic. Since that time many visitors to public galleries wondered what had become of so promising a painter. It was not generally known that Mr. MITCHELL only considered himself to be an amateur. A son of a partner of the late Lord ARMSTRONG, he was busily engaged in Newcastle-on-Tyne as a director of the great firm of ARMSTRONG'S, as well as of various other companies. He was also useful in several ways, for he was chairman of the committee of the art department at Durham University College of Science, president of the Pen and Palette Club, and was largely instrumental in establishing the Arts and Handicrafts Guild, Newcastle. We regret to say that Mr. MITCHELL died on Saturday last at Jesmond Towers. His loss is not easily to be estimated, for there was no man more fitted to aid by his counsels the general movement in favour of technical education, and, indeed, he had already bestowed both personal services as well as large sums of money to the support of the cause. Mr. MITCHELL was in his forty-eighth year.

It is satisfactory to have it ascertained that there is no connection between the geological formation of London and the fogs of London. To be assured on that point is cheap at 250*l.*, the sum granted by the London County Council to the Meteorological Society towards the expenses of an inquiry into one of the plagues of the Metropolis. Many people had come to the conclusion that with the Thames and the abundance of clay it was vain to hope for a clear atmosphere. Now that the Meteorological Council say that atmospheric rather than geologic conditions originate fogs a step is gained, and all that is required is to reform the atmospheric conditions. It is supposed that with regular observations, especially in the early hours of the morning, it may be possible to forecast fogs. As they are not to be avoided or repelled, and as the greater part of the inhabitants of London cannot run away from them, the advantages of foreknowledge are not clear. The County Council have, we conclude, taken that view, for they decline to advance any further grants.

SLAB FROM THE PARTHENON NOW IN THE LOUVRE.

G. A. CHOISEUL-GOUFFIER.

A STORY is told concerning one of the large English towns, all of which was owned by a peer with the exception of one small house. Efforts were made repeatedly to obtain this property, which was from its meanness an absurdity as well as an anomaly. At length an extravagant sum was offered, but the owner remained obstinate. He told the noble lord to be content, for his lordship could go about the world and boast that the whole town was their joint possession. In the same way England and France can claim to be the possessors of the sculpture of the Parthenon. It is true the French share, if compared with what is to be seen in Bloomsbury, is exceedingly limited, for it consists of no more than the fragment from the Panathenaic Procession that is figured above and one of the metopes. For both, Frenchmen are indebted to the Count CHOISEUL-GOUFFIER. But there is no doubt the two countries may be said to have divided the sculpture of the Parthenon between them that existed in the beginning of the nineteenth century. The fragments still attached to the ruin are of minor importance.

The French examples are principally valuable in supplying voids, although it should not be forgotten that much else is required before the whole character of the sculpture originally adorning the exterior of the temple can be realised. But the French pieces have also a peculiar interest for Englishmen, for they are supposed to justify our wholesale ravage of the noblest works of art. When Lord ELGIN contrived to remove the figures from the pediments, metopes and frieze of the Parthenon and to bring them to this country, it could not be asserted that all Englishmen were satisfied. Many lovers of art were indignant. BYRON expressed their feelings in immortal verse. He not only wrote the stanzas in "Childe Harold's Pilgrimage," and epigrams on the transaction, but he devoted a special philippic, entitled "The Curse of Minerva," to condemn an act which was considered by him one of the worst deeds of vandalism ever committed. ELGIN and ERATOSTRATUS, who fired the Temple of Ephesus, were united, and the Scotchman was declared to be the blacker of the two. In addition numerous ills were prophesied as awaiting Great Britain for approving of the spoliation. In Parliament there were also many members in opposition to the voting of money for the purchase of the marbles, on the ground that the treasures were stolen property, and it was unworthy of England to retain them.

In the course of the Parliamentary inquiry on the subject, efforts were made to demonstrate that there was an attempt on the part of the Count CHOISEUL-GOUFFIER to anticipate Lord ELGIN. The following extract from the latter's evidence will suggest the endeavour to prove that his Lordship was not the only culprit; or rather that he simply checkmated a subtle adversary:—

Did Monsieur Choiseul take down any of the metopes and the frieze?—One piece of the metope and some of the frieze; the

metope I bought at a public sale, at the custom-house. It was at the time I returned from France; my things were dispersed all over the country, and my agent told me of some packages in the custom-house without direction; and I gave four or five-and-twenty pounds for them at a lumber-sale.

Thinking those packages to be your Lordship's?—Yes.

When your Lordship heard of those cases being to be sold at a rummage-sale, did your Lordship make any application to the Government, stating that they had any interest in it, and that therefore you ought not to be obliged to purchase?—No; certainly not.

It was a matter of private purchase?—Yes; these things had been left at Athens during the whole of the French Revolution. Bonaparte allowed a corvette to call and bring these things for Monsieur Choiseul, who was an intimate acquaintance of Monsieur Talleyrand's; from the delay which occurred they did not get away in time to escape our cruisers. Monsieur Choiseul applied to me to make interest with Lord Nelson, and I wrote to him and he directed them to be sent home, and applied to Lord Sidmouth and Sir Joseph Banks, wishing Government to make such a purchase as to secure the captors, but at the same time to restore the articles to Monsieur Choiseul. When I left Paris Monsieur Choiseul remained in the belief that they were still at Malta, consequently I had no clue to guess these were his at the time of the purchase in the year 1806, but I immediately wrote to him to state what these things were, as I had no doubt they were his by the metope, and in the year 1810 he wrote to me, stating that his were still at Malta. When I went over to Paris last year I took a memorandum with me for him, and satisfied him they were his, but he has never yet sent about them, and I do not know what he means to do at all; but there they are, marked among my things as belonging to him.

The authority given to Lord ELGIN by the Turkish Government was to enable the artists employed by him "to view, draw and model the ancient Temple of the Idols and the sculptures upon it, and to make excavations, and to take away any stones that might appear interesting." According to one witness the Greeks were not dissatisfied at the removal of the sculpture, as the work allowed of the expenditure of money. The Turks were indifferent, and they despised the idols to such an extent that visitors used to tempt the soldiers on guard at the Acropolis to fire at the sculpture, in order that they might knock down with their bullets heads, legs or arms which could be carried away. The select committee of the House of Commons in their report called attention to the attempt by CHOISEUL-GOUFFIER, as if it were an indication of a plan to carry off the whole of the sculptures:—

It may not be unworthy of remark that the only other piece of sculpture that was ever removed from its place for the purpose of export was taken by Monsieur Choiseul-Gouffier when he was ambassador from France to the Porte; but whether he did it by express permission, or in some less ostensible way, no means of ascertaining are within the reach of your committee. It was undoubtedly at various times a subject with the French Government to obtain possession of some of these valuable remains, and it is probable, according to the testimony of Lord Aberdeen and others, that at no great distance of time they might have been removed by the

Government from their original site, if they had not been taken away and secured for this country by Lord Elgin.

There can be no doubt that CHOISEUL-GOUFFIER'S conduct weighed with the committee when recommending the purchase of the collection at a cost of 35,000*l*. The French ambassador's plan, it was said, corresponded with Lord ELGIN'S, *i.e.* he first employed artists to make drawings, then had casts undertaken, and finally removed pieces of sculpture. He had, moreover, one advantage over Lord ELGIN in having a longer acquaintance with the Turkish authorities. The English ambassador in 1799 succeeded Sir ROBERT AINSLIE, who also had made use of his position to gain possession of works of sculpture. CHOISEUL-GOUFFIER was ambassador from 1784 until the time of the Revolution. He engaged artists not only in Athens to make drawings, but at Sicyon, Eleusis, Delphi and Delos. He was the friend of the Abbé BARTHÉLEMY, the author of the "Travels of Anacharsis," and it was his intention to obtain materials that would serve for the complete exemplification of that book, and would, moreover, enable his countrymen to realise as far as possible the life of the ancient Greeks. The first volume of his own "Voyage Pittoresque en Grèce" appeared, in fact, two years before his appointment as ambassador. His admiration of Greek art, unlike Lord ELGIN'S, was no sudden notion. In 1793 CHOISEUL-GOUFFIER was compelled to depart rather precipitately from Constantinople, and a large part of his collection consequently fell into the hands of strangers. The Revolutionary Government confiscated all his property. Twenty-five cases of sculpture which he claimed as his own were destroyed by fire in Smyrna in 1796. He lived for some years in Russia, and when he was able to return to Paris in 1802, he endeavoured to collect all his belongings which had survived. The twenty-six cases referred to in the evidence and sent to him from Athens were captured with the vessel carrying them by an English frigate belonging to NELSON'S squadron. Although at the time there was war between England and France, NELSON on learning the nature of the cargo arranged with the officers to abandon their claims for prize money, and the cases were left at Malta to await the orders of M. CHOISEUL-GOUFFIER. Another commander, not being aware of the arrangement, despatched them to England, where they were made the subject of a claim by the owners and his representatives. It must be admitted that the cases did not entirely consist of ancient works in marble. CHOISEUL-GOUFFIER, as we have said, had ordered casts of the sculpture of the Parthenon to be taken *in situ*. He had also obtained a large number of inscriptions, the most important being one recording the expenses of the Republic of Athens for the year ending July, 409 B.C. The metope which was taken by the Count was broken in the course of its removal from the Parthenon. According to the French account it had fallen as far back as 1687, when there was the explosion in the building, and was found near one of the columns. It represents a centaur seizing one of the Athenian women. DODWELL says that part of it projects 12½ inches, while in the rest of the metope there is no projection exceeding 7½ inches. The French Government paid 1,000*l*. for its possession.

The part of the eastern frieze in treatment, as will be seen from the headpiece, is in keeping with the other portions of the procession which are now in the British Museum. As it had the advantage of being scrutinised in the clearer light of Paris, the indications of colour were more apparent than in the parts examined in London. It was concluded that originally the ground was blue, the hair of the maidens was gilded, and the holes suggested there were metal ornaments introduced. VISCONTI interpreted the relief as a representation of some young Athenian woman who had deposited in the hands of two male personages the instruments for the sacrifices which they had carried in the procession. Although only one patera is visible, there are traces and marks of the fastenings of other instruments which it is supposed were of gilt bronze.

A wrong is not to be justified by another of less consequence, and casuists might find a difficulty in determining what warrant was to be found for the extensive appropriation of sculpture by Lord ELGIN in the removal of a slab by CHOISEUL-GOUFFIER? Both were ambassadors, and as representatives of civilised countries were bound to show

respect for Greek work. If Frenchmen desired they could have dismantled the temples at an early date. As far back as 1632 LOUIS DESHAYES, Baron de Courmenin, who was ambassador to Constantinople, in his account of his voyage describes the Parthenon as being uninjured by time as if it were newly made. Forty years afterwards another ambassador, DE NOINTEL, not only described, but had drawings made of the temple. The Jesuits, with their customary enterprise, established a French mission in Athens, but the present rather than the past attracts them, and in a few years they removed to Negropont, which seemed destined to become a flourishing Venetian colony. The Capuchins took their place in Athens, and it may not be generally known that the Monument of Lysicrates was purchased by the Order at a time when it was about to succumb to neglect. It was a narrative by a Jesuit which incited Dr. SPON, of Lyons, to make the voyage to Athens with WHELER, of which the record is invaluable. The city in the seventeenth century possessed so much interest for Frenchmen that an imaginary book of travels was prepared by one GUILLET, who never left Paris, and on the strength of the fabrication he was appointed historiographer to the Académie de Peinture et Sculpture. The French could easily have transported the figures from the Parthenon and other buildings in Athens if they cared, and against such a record of forbearance the acquisition of the single section of the eastern frieze seems a venial offence.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VI. (*continued*).

THE fashion of introducing medallioned busts or niched statues of individuals on the façades of buildings may be recommended, as long as their use is the outcome of cautious discrimination. In the metropolis the National Portrait Gallery and the Burlington Gardens façade of Burlington House are two notable examples, though the statues on the latter building have an acquired inappropriateness, the London University having removed to other premises. The general restraint exhibited in the external design of the former building is very pleasing, and only tends to increase the feeling of disappointment induced as soon as the portals are passed.

Moulded brick, terra-cotta and stonework are more in the nature of projective ornament, but attention may in this place be directed to their artistic value. Red gauged brickwork, suitably moulded and carved, gives very pleasing effects: an example of excellent treatment in brickwork may be seen as an exhibit in the Victoria and Albert Museum, London, viz. the façade of the former railway station at Enfield. Some of Mr. NORMAN SHAW'S buildings also serve admirably to show with what effect brickwork can be used.

The Constitutional Club, London, is an important example of the use of plain, moulded, and ornamental terra-cotta; but a practical objection often urged against the use of this material is its frequent tendency to warp in the process of burning, and this renders its successful production an expensive and dilatory proceeding.

Carved and moulded stonework has everything in its favour, except economy. It is well worth while, before deciding absolutely on the use of some ornament, to have a temporary cartoon placed *in situ*, and to judge of the effect; but for proper estimation the cartoon should be a modelled one, so as to gain the correct play of light and shade.

Carved and moulded wood, from an artistic standpoint, is not to be surpassed, but the assistance it lends to the ravages of fire woefully restricts its employment.

Tile hanging is a form of external decoration very much in vogue, and one that may be highly commended. Not only does it impart pleasing variety to a façade, but it possesses also the great advantage that the rooms so bedecked *externally* obtain a more equable temperature than the ordinary brick-walling allows. Good red tiles weather to most effective tones, and when (interspersed amongst them) the renewed tiles are set, a charming effect of colour greets the eye. Bedford Park, Chiswick, is an

FIG. 46.

assemblage of these red brick and tile-hung villas, the original architect being Mr. NORMAN SHAW.

Tiles may be set square or lozenge-ways, and ornamental designs are frequently employed by means of the combined use of square and of shaped moulded tiles, also by colour combinations.

Flint tracery is a form of decoration lending itself to pretty effects, and might be often and advantageously employed where flint is the staple material. Knightbridge, in London, has a church façade so treated, with a very happy result (see fig. 46). This is an example of surface (not relief) decoration. Brick and flint, and brick and boulder combinations are also to be noted frequently, and further variety is possible according as these stones are knapped or undressed; of course, the undressed treatment is more natural, and it is certainly less stiff and more pleasing. In Brighton, these façades are of frequent occurrence in the streets leading back from the Esplanade, and are a vast improvement on the monotonous brick walling so noticeable in London and the neighbourhood.

Plaster is also used in many country districts as the sole means of external decoration, except perhaps for the use of ornamental barge-boards. Modelled plaster ("pargetting"), and cast, or modelled stucco may also prove very effective, but the plaster would be likely to suffer in the atmosphere of a large town. Ipswich and Tewkesbury (amongst other places), have some fine examples of "pargetted" façades. In fig. 47, an illustration of this method of decoration is given.

FIG. 47.

Weather-boarded façades are only noticed here as possibilities realised in former years, but scarcely to be reckoned within the scope of modern practical design, except in the backwoods. Any picturesqueness attaching to these buildings is more the outcome of archæological interest than of any other sentiment.

Steel façades have not, as yet, received general recognition, but quite recently an attempt has been made in Germany to utilise this material in a decorative spirit, instead of merely constructively. It is now very many years

FIG. 48.

since M. VIOLLET-LE-DUC advocated the honest expression of iron in architecture. It will be naturally understood that buildings of the nature of the Crystal Palace are purposely excluded from consideration, but attention may well be called in passing to the pleasing effect of such structures as the Temperate House and the Palm Stove, both situated in Kew Gardens.

In passing, attention should also be called to the treatment that *is* accorded, and the treatment that *should be* accorded to spandrel spaces and to the extrados of segmental pediments. It is very general to introduce carved full-length figures reclining more or less uncomfortably on a constantly retreating base. This is altogether wrong, as it is bound to create a sympathetic feeling of unrest on the part of the spectator (see fig. 48).

If geometrical or floriated filling is not always deemed desirable, suitable figure treatment is possible without recourse to the *miserere* method noted above. A winged head (an accepted type for angels) will fill in the space admirably (see A, fig. 49), or treatment such as that shown at B in the same figure. These are merely two methods of treatment taken at random, or (more accurately) are those that came first from the writer's pen as illustrations.

FIG. 49.

The tympana of pediments may be advantageously decorated with statuary groups, as distinguished from mere relief decoration; the more remote from the point of view, the bolder should be the treatment.

Some further mention of ornament or decoration arises later in this treatise under the heading of individuality and conceits.

(To be continued.)

AUGSBURG.

IN September last a congress was held in Augsburg of the Union of German Architects and Engineers. There were no less than fifteen meetings. The Germans are accustomed to be thorough in all things, and as a memorial of the event three volumes have been brought out containing many hundreds of illustrations of the ancient and modern buildings of the city.

Augsburg has had a history which goes back to the time of the Romans, when it was known as *Augusta Vindelicorum*. In the Maximilian Museum there are many objects belonging to that period. It has also been ascertained that on the site of the present Ulric Kirche a temple to JUPITER was erected. There were other temples bearing the names of the gods honoured by Romans, such as MARS, VENUS, CERES, &c. Memorials also exist of different Roman legions. But what is most interesting is the evidence that art was appreciated in the city. A Corinthian capital would by itself be enough to demonstrate the perfection attained by the architectural carvers. Examples have also survived which display the skill of the metal-workers, mosaicists, potters and other crafts.

The Roman colony appears to have come to an end during the fifth century. In A.D. 558 Augsburg and the surrounding district became a part of the Frankish kingdom. Some two hundred years afterwards it was almost entirely destroyed in the war between CHARLEMAGNE and TASSILO. Then it fell into the hands of Swabian dukes. The relics of that period are not important. There is no doubt that ULRIC and other bishops were zealous for the erection of churches; but the position of Augsburg, which was exposed to invasions, was unfavourable to the duration of buildings, and the remains are little more than indications of former greatness. The crypt of the cathedral may date from the tenth century. As the Romanesque period in Augsburg is supposed to have been exemplified by as fine structures as were to be found in any place in Germany, the dearth of examples is to be regretted. Augsburg was able to purchase independence in the

thirteenth century, and it ranked as a free, imperial city for five hundred years. It was to be expected that during so long an era of liberty architecture would be recognised. The greater portion of the cathedral, the church of Saints Ulric and Afra, suggest the importance attached to religion in the earlier part of the period. BURCKHAIR'S paintings and etchings are sufficient to show the excellence of the Renaissance work. For a time there was a contest between plebeians and patricians, but it does not appear that the vast trade of Augsburg suffered through the dissensions of the citizens. The city was the residence of the FUGGERS, the bankers, who solved the everlasting "housing problem" by founding one district of the city which still remains, and in which rents are very low.

The collection of views commences with the Rathhaus, which was built by ELIAS HOLL, Augsburg's most famous architect, between 1615 and 1620. Near it is the Augustus-brunnen, one of the three fountains in the imperial Maximilianstrasse, and which is surmounted by a figure of the Roman emperor. The exterior of the Rathhaus is unusually severe, but some of the rooms within are richly decorated, and the ceiling in the "Goldener Saal" is one of the sights of Augsburg. The ornamental stoves in some of the rooms reaching from floor to ceiling are remarkable specimens of ceramic architecture. What must strike everyone in looking through the illustrations is the marvellous variety exhibited. Munich, which is not 40 miles distant, being a capital, has been transformed from time to time at the desire of the rulers, and is now a city of reproductions, but Augsburg has been left alone as if it were still the Freistadt. In the reign of CHARLES V. the people disobeyed the command to address the emperor in a Latin speech, and the same independent spirit is seen in the avoidance of anything that could be considered as an official type of architecture. Occasionally a long building may be seen like that adjoining the world-renowned Hotel Drei Mohren, which is somewhat monotonous in treatment, but as a rule the houses have not much wider frontages than is common in London, and every owner endeavoured to construct something different to his neighbours' houses on both sides. The streets are sometimes broad and sometimes narrow, occasionally, as if by chance, widening out into a Platz. Then there are old towers and gateways, and a visitor must be exacting who is unable to find subjects for his sketch-book at every turn. No doubt baroque examples abound which must be attributed to the influence of Frenchmen, who were long regarded as the arbiters of taste.

It was not in the Late Renaissance period alone that French influence was injurious in Augsburg. Lord LEIGHTON maintained that German Gothic was defective, because the builders imitated French examples instead of developing their own admirable Romanesque. He cited as a remarkable instance the cathedral of Augsburg, especially as it was erected in a famous centre of artistic activity, from which many fine works went forth. He said he shuddered whenever he thought of the exterior of the building, while within, "a choir at least half as high again as the nave, and of the usual cubic shape, is stuck on to, or against, that nave, *ex abrupto*, without a trace of an attempt at articulation and transition, and with an effect I leave you to imagine. But what you hardly can imagine is the aspect presented here by a circular east end and ambulatory crushed round a square choir. In this wonderful structure the workmanship vies with the design; one shaft at the north-east end of the choir—and, by the way, all the shafts rise without bases from the floor—stands truncated and vacant at the top, because apparently it did not work out so as to meet the adjacent vaulting-rib which it was destined to carry." It may be mentioned, as suggesting the difficulty of satisfying severe critics, that the only buildings in Augsburg referred to by KUGLER are the cathedral, the Rathhaus, or hôtel de ville, and the Zeughaus, or arsenal, the last having over the entrance a vigorous group of sculpture, St. MICHAEL and the Demon, by JOHANN RICHEL.

In modern times Augsburg has distinguished itself by its marvellous advance in industry. The population is now nearly 100,000, or at least 50 per cent. beyond that of the city twenty years ago. The increase is mainly owing to the

call for workmen. Augsburg, according to FROMMEL, needs no other development than that arising from industry, and there was a time when its manufacturers were proud as princes. A great many immense factories, in extent almost equal to villages, have been erected. Among the productions are machinery of all kinds, metalwork, cloth, cottons, chemicals, paper, gas, cement, tobacco, &c. The industrial districts of Augsburg consequently have a very different aspect from the older parts of the city, and strangers who knew the place a dozen years ago will be amazed at the change, while glad that so many of the streets remain in their former condition. It is no wonder the local architects and engineers are proud of a city which is making such bold efforts to surpass its former history.

CULROSS ABBEY.

AT a time when it is proposed to restore the ancient Abbey of Culross, it may be well, writes a correspondent of the *Glasgow Herald*, to call to the remembrance of our readers some features connected with the ecclesiastical history of the ancient burgh. According to tradition the sainted Princess Thenew, without the aid of either oars or rudder, drifted from Aberlady to Culross in a frail boat. Weary and exhausted she stepped on shore, and at the first dawn of the morning gave birth to St. Kentigern, or Mungo. From time immemorial the spot on which the interesting event took place has been pointed out by the people of Culross, and so sure was Archbishop Blackadder, in 1503, that tradition was right that he had a commemorative chapel erected upon the site of the birth of Mungo.

Mungo had a wonderful training at the feet of St. Serf, on the sunny slopes which overhang the shore between Dunimarle and Torryburn. Some of St. Serf's pupils took to stone-throwing one day, and in the shower of pebbles a favourite robin was killed. Mungo restored the bird to life, and he followed this miracle up by causing a flame, when light was needed, to burst from a hazel twig. The tree from which the twig was plucked grew into a grove, and the traditions of the miracle were long perpetuated by twigs bursting into a flame when breathed on. The time came, however, when St. Mungo hid himself from the slopes of his birthplace to Glasgow, and for a long number of years Culross dropped out of the world's gaze. From the far-off days on which St. Mungo shook the dust off his feet until the eleventh century, when the "Gracious Duncan" met the King of Norway in battle, Culross does not find a place in history.

The Danes and the Norwegians had a hot time of it, but the people of Culross do not care to linger over the eleventh century events connected with Bordie Farm, where the Scottish Standard was hoisted. They prefer the miracles of St. Mungo to the details of battle, and they leap from the early days of the sixth century to 1217, at which time Malcolm, seventh Earl of Fife, founded the monastery. Alexander II. did a great deal for the enriching of Dunfermline Abbey, and doubtless he looked on the work of Earl Malcolm at Culross with a kindly eye. The first abbot died in 1232, and an idea of the magnitude of the building will be obtained when it is stated that at that time as many as 100 monks and 135 probationers or novices are stated to have been located at Culross. The monks of Culross seem to have taken fright at the first blast of the Reformation trumpets, and when the terrible work of "dingin the abbey doon" began it was found that there were only nine monks in the building, and that the novices had to a man taken flight.

All that remains of the massive structure is the choir and the central tower and some fragments of aisles and chapels. The choir is occupied as the parish church, and entrance is obtained through the tower. The old cloister court in which the monks were put to flight by the Reformers is occupied as a garden, but visitors find much that is interesting in the ruined walls. The groined roof and arches of the great hall always command attention, and in the vaulted passage which leads through a Norman doorway are fine examples of the architecture of the flourishing days of Scottish monasteries. The old choir of the abbey has, as Mr. David Beveridge, the author of "Culross and Tilliallan," rightly puts it, been so "much metamorphosed in the course of the alterations which at different times it has undergone" since it became the parish church, that it is difficult to understand the original construction of the building. A magnificent specimen of an Early English window is obscured by a gallery and a staircase.

It is proposed to remove the south and the east galleries, and to provide sittings for the accommodation which would be lost by the opening up of the arches and the re-erection of the aisles on the south and the north sides. Repairs involving a cost of 2,000*l.* are absolutely necessary if the building is to be

kept in a half decent state of repair, and the heritors have pluckily come forward and guaranteed this amount. Sir Rowand Anderson estimates that the carrying out of his entire scheme would involve an expenditure of 5,000*l.*, so that 3,000*l.* will fall to be made up by subscription. The sum of 3,000*l.* is too big an expenditure for the people of Culross, who are no heritors, and this accounts for an appeal being made to the people of Scotland, and especially to the city of Glasgow. Like Portia, the ancient burgh has many suitors during the course of a year, and there is nothing which troubles visitors who have an eye for the fitness of things more than the modern fittings of the parish church, by which many of the beauties of the choir of the historic building have been obscured. Sir Rowand Anderson proposes to purge the building of its internal architectural vagaries. The work can only be done if help comes from without.

While writing of the ancient burgh, it may be interesting to point out that there is a greater chance to-day of history repeating itself industrially than has been the case during the past two centuries. In the days when James VI. was a frequent visitor at the "Palace" of the Sandhaven, Sir George Bruce's coal-works were the wonders of Scotland. The works were wrecked in the "Borrowing Days" of March 1625 by a terrific storm, and from then the record of Culross industries was a record of decay. The exploring bores which have been driven into the metals in those days of demands for coalfields prove that the deeper and finer seams of coal are lying intact. A lease has been obtained of the minerals of Low Valleyfield—a village to the east of Culross, where many a squabble took place over the monopoly which Culross claimed in connection with girdle-making—by the West of Fife Coal Company, Ltd., and such a guarantee of early development has been given the North British Railway Company that it is announced that the Dunfermline-Culross Railway will be commenced at no distant date.

LEEDS AND YORKSHIRE ARCHÆOLOGICAL SOCIETY.

A MEETING was held on the 26th ult. of the members of the above-named Society, presided over by Mr. Butler Wilson, at which an interesting paper was read on street improvements in Leeds by Mr. Fredk. Musto, A.R.I.B.A.

Mr. Musto claimed that as citizens, and still more as architects, they were concerned in whatever made for the improvement of the city with which they were connected. Leeds had much improved, but it still missed the mark, for whilst streets had been made wider they still remained throttled at their necks through lack of a scheme. The fact was that the laying-out of the lines for the main streets and public buildings of the city should not be left to chance and spare moments.

Leeds did not make a very favourable impression upon those who entered it. He did not think of comparing the town with Oxford or Warwick, or a city like Bristol or York, which made up for the absence of dignity by the presence of old-world charm. But he fearlessly declared that in the aspects of its streets and most of its buildings Leeds was far behind Manchester, Liverpool and especially Glasgow.

There was an air of something almost amounting to squalor about the town that even the City Square and Boar Lane could not destroy, and that Briggate would certainly not reduce.

City Square served to provide a good first impression, and he hoped it would be long ere its dignity was spoiled by the ceaseless careering of trams round it as a general changing station. It was far better than Forster Square at Bradford, though the vista from the latter up Market Street was very fascinating. But City Square badly needed the statue, which would help to mitigate the bad effect of the Post Office buildings; and he thought the circular balustrade, enclosing nothing and cutting off the sight of the base of the new buildings, was an absolute waste of money. The widening of Infirmary Street to 75 feet was not a crying need. Though it was too narrow, Park Row was a street of which they might well be proud, happy in the diversity of its buildings and the way they were caught "end on" together with the appearance of the Exchange, which he considered the second best building in the town. The cathedral was to be moved, and the vista, he was afraid, closed by a gradually diminishing line affording a flank view of shops.

Great George Street had now arisen from its desolation and was becoming an important street, with at least one building in it which would be an object of pride to architects. In time he considered it would form part of an important "through line" east to west, relieving Upperhead Row and connecting with Quarry Hill.

The widening of the lower part of Woodhouse Lane was commendable; but what, said Mr. Musto, were the authorities aiming at? Was there any scheme or definite line, and if so, how far did it reach?

Guildford Street had been getting widened for years past.

Of course, the wretched shanties at Albion Street corner were doomed; but what lines were to be pursued? If some of the money which had been spent on making some of that back street, Lands Lane, rather less of a back street, had been spent in improving Guildford Street, the gain in appearance would have been as great as in point of convenience.

Briggate possessed all the materials for an effective appearance some day. There was the promise of a building on a good scale in the Grand Central Hotel; but when they thought of Corporation Street, Birmingham, or Lord Street, Liverpool, what a contrast. Boar Lane, though presenting no single building of which the design was a pleasure to contemplate, was in the sum total far more worthy and dignified.

The Vicar Lane scheme was good; but had they noticed, asked Mr. Musto, its rise and fall and snake-like windings, and how, when approaching from North Street, the new market buildings hid their face? A straight line would have left the Dispensary intact, and run beyond Kirkgate and the Corn Exchange to Swinegate.

He did not see how the new street from Briggate to Albion Place could relieve Commercial Street or be a success. It began badly, and was not quite in line with Albion Place.

With regard to what might be done, Mr. Musto suggested a line of access from the end of Roundhay Road to Woodhouse Lane, near Carlton Hill. Most of the line existed already, but there was no leading thoroughfare. He would like, too, to see a street cut in prolongation of Oxford Place by Park Square to Park Place; and a better access to the Yorkshire College and Grammar School than was provided by the present College Road, with its plentiful supply of back areas and middens. As for Victoria Square, he would leave that in their hands.

Concluding, Mr. Musto declared it rested with the authorities to say if Leeds was always to be left behind by other and smaller cities, or whether, by doing things in a bold way and going straight forward, and having an ample and properly worked scheme, they would attain the position due to the size, population and prosperity of the city.

At the close a vote of thanks was accorded to the lecturer, on the motion of Mr. G. F. Bowman, seconded by Mr. W. H. Thorp.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT a meeting of the Association held in the Rooms, 117 George Street, on the 25th ult.—Mr. A. Hunter Crawford, F.R.I.B.A., the president, in the chair—Mr. Daniel Macfie read a paper on "Artificial Lighting in the Nineteenth Century," which was illustrated by limelight views. Alluding to the street lighting of Edinburgh, Mr. Macfie said it was little short of a scandal that in twentieth-century Edinburgh a unique installation of an antiquated and effete style of gas lamp existed side by side with the electric arc lamp. It was true that in some six thoroughfares throughout the city there were specimen installations of incandescent gas lighting, but these and the 38 miles of electrically-lit streets served only to bring into stronger relief the 150 miles of streets within the city boundaries which were still lit with an effete style of gas lamp. The juxtaposition of electric arc lamps and an effete type of gas lamp consuming only 2 cubic feet of gas per hour doing eight-candle duty was not matched in the United Kingdom, and it was not creditable to the powers that be that, while they had widely and generously adopted the electric arc lamp for street lighting, no sustained effort had been made to improve a system of gas lighting already existing. There need be nothing but praise for what had been done in electric lighting, but as it appeared to be generally conceded that on account of the cost a halt must be called in that direction, it might not be unprofitable to inquire what steps might be taken, and at what cost, to improve the 150 miles of gas-lit streets in Edinburgh to-day. As a first step towards that end, the present globe lamp with its blow-hole should be abolished, and with all convenient speed. To replace these square-tapered lanterns might be substituted at a slightly increased cost, and these could be of a type that would suit equally well with an enlarged flat flame burner or a Welsbach incandescent burner. The only method worthy of serious consideration for use for important streets was the adoption of the incandescent burner—preferably in a square-tapered lantern, as suggested. Already incandescent gas lamps were installed in several quarters of the city, lighting about $1\frac{1}{2}$ miles of streets, but "the man in the street" might be excused if he came to the conclusion that no serious or well-organised attempt was made to keep these lamps and their burners in the best condition. Edinburgh was at present spending about 2,630*l.* more for the gas lighting of 151 $\frac{1}{2}$ miles than it was spending on the electric lighting of 38 $\frac{1}{2}$ miles. No one would suggest that what had been done in electric lighting was not well done; but it was most reasonable to suggest that the time had come to improve some portion of the remaining three-fourths of their streets, which had been denied the luxury

of electric lighting. A modest beginning might be made with, say, fifty miles of the more important thoroughfares with 3 feet incandescent gas lights at a cost of, say, 34*s.* 7*d.* per lamp, an extra of 15*s.* each, or an additional charge of 46*l.* 15*s.* per mile per annum, with lighting power five times increased. To this would have to be added the cost of mantle and renewals and the initial cost of new lanterns; but those globe lamps displaced could be used for the outlying districts until such time as the globe lamps were finally superseded. The one hundred miles of streets still remaining might at once have burner tips consuming 3 cubic feet per hour substituted at a merely nominal cost, while the increased charge for gas would only amount to 10*s.* per lamp per annum, giving a light 75 per cent. better. Such globe lamps as remained in use might have a metal lifting flap for the covering of the present blow-hole. Those suggestions might be worth much or little, but the question was clamant and would not brook delay in the public interest. One could not help feeling indeed that if the lighting of the streets of Edinburgh and Leith were entrusted to the Gas Commissioners this would be to the public advantage. On the motion of Mr. Thomas Ross, Mr. Macfie was awarded a vote of thanks.

ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

A GENERAL meeting of members was held in the Institute Rooms, Dublin, on the 26th ult. The president, Mr. G. C. Ashlin, R.H.A., occupied the chair.

The President made a statement as to the various matters which had come before, and had been dealt with by, the Council since the last general meeting of members. He asked the members present to enter into a discussion as to how far the existing conditions of contract in their individual experience met the general needs of the profession. As the proposed revision of the conditions of contract generally in use in this country is a matter which the Council is very carefully considering, and which is occupying very largely the attention of the profession generally, the invitation of the President was cordially accepted, and a very interesting discussion took place. Mr. J. Rawson Carroll stated his views at some length, and was followed by Mr. Gilliland, Mr. Murray, Mr. Shaw, Mr. Orpen, Mr. Sheridan and others.

Mr. Albergy moved a resolution in reference to the proposed initiative of a qualifying examination as a condition precedent to election to membership of the Institute.

ARCHITECTURE AND THE AGE.

A PAPER was read at a meeting of the Northern Architectural Association, Newcastle-on-Tyne, on February 25, by Mr. G. S. Aitken, architect, Edinburgh, on "Architecture and the Age." The plans of the present-day houses and those of the eighteenth century were contrasted, and the excellent work pointed out which modern desire for municipal buildings had elicited. An opinion was expressed that the type of Pointed work shown in the London Law Courts would be revived in practice. Reasons were sought for the preference which Nonconformists as well as Episcopalians have for the use of Pointed architecture in churches. Classic architecture, it was assumed, had intellectual beauty, and Pointed both intellectual and moral beauty. In the course of the argument reference was made to one of the public buildings in Edinburgh in the following terms. It is remarkable what an effort Greek architecture makes before it realises itself in a successful work of art. One of the finest buildings in the country is the Royal Institution, Edinburgh. It is in the Greek Doric style, designed by its architect, W. H. Playfair, from a modern point of view. If we imagine all detail removed that is not necessary to construction, how bald an affair it would be; its porticoes, wings and lateral rows of columns would have to go. We could not apply this process of "thorough" to a Pointed building. Every part is there as a constructive necessity, which can furnish an ethical reason for its presence. Regrettable failures in the acoustics of some buildings were referred to, and the subject of expression in architecture considered. The paper closed with references to the Garden City scheme, Bournville and Port Sunlight, which, it was indicated, were pioneered by the village of Saltaire.

An Oak Screen and clergy and choir stalls have just been presented to All Saints Church, Bubwith, Yorks, by Mrs. Wilkinson, The Hall, Howden, in memory of her late husband. The work has been carried out from the designs and under the superintendence of Mr. G. Malam Wilson, architect, of Sheffield.

NOTES AND COMMENTS.

AGAINST the opposition in the City of London to the Building Acts Amendment Bill the London County Council could not hope to prevail in Parliament. The parliamentary committee of the Council, who were able to gauge the dangers which were ahead, acted wisely in advising the abandonment of the Bill, which was agreed to on Tuesday. It was suggested that another Bill embodying the results of further investigation should be introduced hereafter. All that can now be done is to endeavour after a more strict administration of existing Acts. If those who own or occupy premises in the City for business purposes will not have them altered in order that outbreaks of fire should bring no danger, they should at least avoid an evasion of the Factories Acts. It is not right to have a larger number of people employed in offices than was contemplated when the buildings were planned. It is now known by sad experience how easily a panic can arise, and when a crowd of assistants are required to carry out a business a part of them should be drafted to buildings where there can be ample space in stairways and places of exit. In that way the amendment of the Building Act can be postponed without danger until there are additional deliberations. But it is a terrible consideration that many lives must be endangered on account of the rivalry between the Common Council and the County Council, and the desire of property owners to avoid expense in providing means of safety for the people in their employment.

THE equestrian statue of MARCUS AURELIUS in Rome has received more attention, especially from artists, than any other work of its class in the world. PETER of Cortona is said to have ordered it to march, believing, for the moment, it was alive. MICHEL ANGELO said it would appear a living creature if the raised hoop were placed on the ground. When FALCONET, the sculptor, received the commission for the colossal equestrian statue of PETER THE GREAT, he had castings made of the different parts of the animal, and he wrote a very long essay pointing out all the defects he could discover. The horse is more admired than the rider, and it has even been said that the figure of the emperor is the work of a later time. It was once supposed that the subject was CONSTANTINE, but the majority of archaeologists are disposed to believe that it represents the merciful emperor MARCUS AURELIUS. It has been often observed that the mane assumes an unusual form in the part between the ears, and it has been recently suggested by the Director of the French School of Archaeology in Rome that the arrangement is a record of a Roman legend, although the connection of the emperor with it is not apparent. During one of the wars in which Rome was engaged a common soldier imagined that he could easily obtain possession of the person of the king against whom they were fighting. He had observed that the monarch used every evening to retire beyond his camp in order to seek repose or to weigh his position. The king generally stretched himself under a tree, to the annoyance of a screech owl who had a residence in the branch. The soldier was permitted to take a strong horse with him, and he succeeded in his enterprise. In remembrance of the event the sculptors used sometimes to model the horse's mane in a way that would suggest the bird. There is no ancient equestrian statue having the importance of that of MARCUS AURELIUS, and it is therefore impossible to say to what extent the practice was general. But every student of ancient art is aware of the existence of peculiarities possibly possessing an acquaintance with long-forgotten legends.

M. REDON, the architect in charge of the Louvre, has an excellent opportunity to display his skill in overcoming a difficulty that is now general. He is entrusted not only with the disposition of the electric lighting in the garden of the Tuileries, but what is no less important, with the form of the lamps also. The task is not easy, for when LE NÔTRE laid out the gardens there could only be an imperfect illumination, and accordingly he disregarded it. He arranged his trees in great masses as if repose for the eye by day was what he principally sought. There is no doubt of his success, for the gardens are still the delight of

the citizens of Paris, as well as of all visitors. The work has been a long time delayed owing to the difficulty of settling the question of expense. The Municipality at first regarded the work as national, and therefore should be paid for by the Government. On the other hand, the Ministry declared the lighting was essentially a municipal undertaking. The impatience of the public has at length compelled a solution to be arrived at, which is that the expenses will be shared equally by the State and by the city.

THE appointment of head master of the Birmingham Municipal School of Art will become vacant in September next, on the retirement of Mr. EDWARD R. TAYLOR under the provisions of the Corporation superannuation scheme. The committee of the school would be prepared to apply to the Board of Education to exceptionally recognise a head master a specially qualified candidate. Inquiries should be addressed to the secretary, and applications for the appointment should be addressed to the chairman of the management sub-committee, Municipal School of Art, Birmingham. The latest date for the receipt of applications is Saturday, March 21.

ILLUSTRATIONS.

NEW CHURCH, ALL STRETTON, SHROPSHIRE.

THIS mission church, in the parish of Church Stretton, Shropshire, has been built of shaly local stone from the hills, in random work, with dressings of Gimshill, red tile roofs, and some half-timber work in gables, a feature in several old Shropshire churches. As the site is on the side of a hill, considerable excavation in the shaly rock was necessary to form a platform for the building. The plan consists of nave for 150, chancel, and large vestry for use as a Sunday-school and as transept for extra accommodation in the church when required. The approach from the road below is through an oak lych gate up a steep pathway. The church forms a pleasing feature in the landscape, with its mountainous surroundings. The cost, including strong retaining walls back and front of the site, was under 2,000. The church was erected by Messrs. W. BOWDLER & CO. from designs by Mr. A. E. LLOYD OSWELL, A.R.I.B.A. of Shrewsbury.

HOUSE, NEAR BIRMINGHAM.

BAILRIGG, LANCASTER: ENTRANCE FRONT. FROM SOUTH-WEST.

ELTHAM PALACE, THE HALL.

CORDWAINERS' HALL, CANNON STREET, E.C.: THE SMALL HALL.

THE word "cordwainer" is commonly believed to have been derived from the French *cordonan*, which in turn, came from the Spanish *cordoban*, suggesting the leather of Cordova; but Dr. JOHNSON was uncertain whether the word was not more related to *cord*, of which shoes were formerly made, and continued to be in the Spanish West Indies in his time. The French had several words to describe shoemakers, and one reason for the use of *cordonnier* was said to be that shoes had to be attached with cords. The guild was important. GEOFFROI PLANTAGENET, son of HENRY II., granted a charter to the *cordonniers* of Rouen. The cordwainers of London were formed into a brotherhood or fraternity in the eleventh year of the reign of HENRY IV. STOW says:—"Of these cordwainers I read that, since the fifth of RICHARD II. (when he took to wife ANNE, daughter of VESALAUS, king of Boheme), by her example the English people had used piked shoes, tied to their knees with silken laces or chains of silver or gilt, wherefore in the fourth of EDWARD IV. it was ordained and proclaimed that beaks of shoone and boots should not pass the length of 2 inches, upon pain of cursing by the clergy, and by Parliament to pay twenty shillings for every pair. And every cordwainer that shod any man or woman on the Sunday, to pay thirty shillings." In STOW's time the hall stood in Destar Lane off Friday Street.

ELTHAM PALACE.*

By P. ION ELTON.

THE remains of the Royal Palace of Eltham, of which the great hall, portion of the buttery and the moat with the north bridge spanning it now alone exist above ground, are situated in the south-east suburb of London.

The manor of Eltham has been connected with the Crown since Saxon times, and is mentioned in the Domesday Book as having been held by one Haimo as the sheriff of Odo of Bayeux, to whom it had been granted by his half brother William I., when he created him Earl of Kent. Upon Odo's banishment the estate reverted to the Crown, and in the reign of Henry III. the first royal palace appears to have been built. It was greatly enlarged in the next reign by the noted Anthony Bec, Prince Palatine and Bishop of Durham, who held it as trustee, though he afterwards managed to acquire it for himself.

Upon the death of this prelate the palace again reverted to the Crown and formed a favourite residence of Edward II. and III. This latter monarch entertained the captive King John II. of France here in 1364, and it was at Eltham thirteen years later that the Parliament was held by which the king's grandson (afterwards Richard II.) was created Prince of Wales.

Though the palace at this time must have been of considerable magnificence it did not satisfy the taste of Henry IV., in whose reign it was largely rebuilt. Most of the work now standing dates from this rebuilding. The body of the hall is ornamented (in the spandrels of its north door) with the crest of this king, and the oriels, even if they are not contemporaneous, must have been built soon after. The buttery was undoubtedly built at the same time, for the stonework of the fragment remaining courses with that of the hall. The date of the bridge is, however, harder to ascertain, but its general character and what moulded work it possesses appear to be of about the same period, though possibly a little earlier in date. Messrs. Dunnage and Lever, in their monograph on the great hall, state, however, that the bridge was probably the work of Bishop Bec—a statement for which no confirmation is offered.

Henry VI. made Eltham Palace his chief residence, and Edward IV. spent large sums in repairing it, while Henry VII. completed the work by building a "fair front" facing the moat.

From this time the story of Eltham Palace has been one of decline. In the next reign the greatly preferable situation of Greenwich Palace caused Henry VIII. to make the latter his chief abode in Kent, the waterway of the Thames then being by far the best means of his removing to his other palaces, Windsor, Richmond and Hampton Court. The palace, however, was honoured by visits from Elizabeth and James I.

Upon the institution of the Commonwealth the manor and palace were sold, and an interesting survey made at this time testifies to their then extent and condition. It records that the demesne was over 1,200 acres in extent, and the palace, though then in a bad state of repair, consisted of a fair chapel and great hall (which alone were furnished), thirty-six rooms and offices below stairs, and above stairs seventeen lodging-rooms on the king's side, twelve on the queen's and nine on the princes' sides, with various other rooms and closets; also thirty-five "bays" of buildings containing seventy-eight rooms used as offices, and placed round the courtyard, which was an acre in extent. The materials were valued at 2,753*l.* exclusive of the cost of demolition. The hall was then stripped of its lead and the chapel and many of the other buildings razed, and the remaining portions of the palace allowed to decay, so that when the modern house, Eltham Court (to which the great hall is attached), was built about sixty years ago there only remained to be incorporated with it some fragments of the buttery, though no doubt the foundations of at least the buildings that surrounded the other sides of the courtyard are still extant beneath the surface of the lawn and garden of the present house.

After the hall was stripped of its lead it was covered with a tiled roof and used as a barn, the windows being blocked up,

and it remained in this capacity till modern times. Unfortunately, in order apparently to admit vehicles, the middle pier of the southern face of the south oriel was demolished, and the gutterings appear to have been allowed to become defective, so that the ends of the rafters became decayed, and in 1828 it was found necessary to shore up the hammerbeams as the roof was thrusting out the walls. In order to fix the shores the bases of the wooden columns above the hammerbeams were sawn off, and in the accompanying drawings recourse had to be made to those published by Pugin and Dunnage and Lever (which were made from measurements taken during these repairs) in order to complete the design of the roof.

The drawings published by Pugin in his well-known book on "Gothic Architecture" show also an elaborate lantern-like tracery framed around the pendants of the hammerbeam, giving them the appearance of enlarged editions of the pendants of the stone vaulting over the lady chapel of Christ Church Priory Church, Hampshire. What authority there is for this is unknown, and unfortunately the drawings are inaccurate in several particulars, notably the shape of the drops of the pendants and the vaulting of the oriels. It should, however, be remarked that the pendants show traces that seem to indicate that there was some such enrichment, and that it has been removed and its connections with the pendent chiselled off.

Another feature to be noted is the small purlins tying in the lowermost tier of windbraces. They only occur in the three eastern bays on the south side, and there is no evidence of their having been extended further. They were probably an afterthought, made necessary by the braces starting, owing to some slight settlement in the roof, as they are awkwardly placed and hide from view the lower cusps of the braces they tie in. They are obviously a copy of the face mould of the collar-beam.

It is said that the hall was wainscotted from the sills of the windows to the floor, though there are now no traces on the walls that this was ever the case. Indeed, the manner in which the stonework is bonded into the brick lining at the oriels and the doors certainly seems to negative this idea. Probably the hall was hung with tapestry or plastered and frescoed.

Originally the western end was reserved for the royal table, which was elevated on a dais, and connected by the oriels with the royal apartments, and the eastern bay was partitioned off by a screen, the oak frame of which is still *in situ*, forming a passage connecting the north and south doors, and screening the hall from the door leading to the servery. Over this screen was probably placed the minstrels' gallery.

The main portion of the roof is in splendid condition, and the workmanship both of it and the stonework is remarkably precise and clean. There is hardly half an inch variation in the dimensions and spacing of the buttresses. The stonework is said to have been quarried near Reigate, but that of the oriels is different to that of the body of the building. The smoke and air of modern London is unfortunately having a disastrous effect upon it, and in exposed places, especially on the south exterior, it is in places eaten away five inches from its original surface, and the jambs of many of the windows are similarly decayed.

The hall is being restored by Messrs. Shillitoe, of Bury St. Edmunds, under the direction of Mr. T. G. Jackson, R.A., who, amongst other repairs, is having the shores of 1828, which greatly disfigured the interior, removed, their place being taken by an unobtrusive iron truss placed within each of the timber trusses, so obviating any necessity for renewing the original woodwork, while the purlins have been strengthened with L-iron bolted to their upper sides.

It may be of interest to add that the bridge spanning the moat on the south side was still standing in 1808, and that in 1834 Messrs. King and Clayton, when examining some of the apartments of the palace under the ground floor then extant, and forming portion of the farmhouse that stood on the site of the present Eltham Court, discovered an underground passage of considerable extent and interest. In their report to the *Gentleman's Magazine* they stated that under a then recently made arch they found a trap door leading to an underground room about 10 feet by 5 feet, and proceeding from which

* See Illustration.

a narrow passage about 10 feet in length conducted to a series of passages with decoys, stairs and shafts, some of which were vertical and others at an inclined plane, which were once used for admitting air and for hurling down missiles or pitch-balls upon enemies, according to the mode of defence in Mediæval times, and that it was worthy of note that at points where weapons from above could assail the enemy with greatest effect there these shafts verged and concentrated. About 500 feet of passage was passed through in a direction westward towards the old Middle Park, and under the moat for 200 feet. The arching was broken in under a field leading from Eltham to Mottingham, but the brickwork of the arch could still be traced further, leading in the same direction.

The remains of two iron gates completely carbonised were found in that part of the passage under the moat, and large stalactites of supercarbonate of lime that hung down from the roof of the archway showed the lapse of time since the passage had last previously been used.

The above discovery recalls the incident that, in 1405, the Duke of York was accused of intending to break into the palace and murder Henry IV. Such an access would have formed an excellent means of effecting such a design to anyone acquainted with it.

THE STAINED GLASS OF THE FUTURE.*

(Concluded from last week.)

WE have now reached a most important section of the work—the selection of the glass. This I hold to be the artist's most individual task, which he cannot delegate to anyone. The usual way in firms is to have the different colours in numbered racks; then the master numbers the outline, and the cutter goes to the corresponding rack, and chooses any sheet and part of a sheet he likes. What idea can the cutter have of the relation of each piece to the whole, or how one colour will affect another—a matter of the utmost difficulty in stained glass? Colours and tones affect each other enormously, and demand the greatest care and experience. In selecting, every lead must be taken advantage of to vary the adjoining pieces. Of course, the master makes alterations when the glass is on the easel being painted, or even after it is leaded up. One hears of quite heroic attempts in that direction—of one master who had a figure cut over three or four times before he was satisfied. It was very good of him to take so much trouble, but what bungling not to know what he wanted at first. How can that warmed-up colouring give one the exquisite thrill of the tingling grip of the artist's hand, where every piece, however varied or unexpected, seems inevitable? We will urge this reform in the interests of the masters themselves. We will tell them that in denying themselves the pleasure of selecting every piece of glass they miss the highest rapture in the production of a stained-glass window, even at the cost of a smaller output and consequent diminution of profits. We must save them from themselves.

That pernicious method also favours a great fallacy—that the light and dark of a sheet of coloured glass should be utilised to give the light and shade of a drapery. This is to make a window pictorial and leads to general flabbiness of colour. Now the principle of colour in stained glass is contrast, one piece throwing up another. Only by this means can one display the jewel-like character of the material. This principle of contrast applies not only to the light and dark of a colour, but to a mixture of contrasting colours or tints, enhancing the beauty of one. Take a yellow drapery, for instance; there should be a dominant note of rich, pure yellow; then the colour branches out on each side, as it were, on the one side to the greens and on the other to the reds. These are not to be gradual changes, but sudden contrasts, a greenish yellow against a reddish yellow, for instance, and there must be contrast in values as well. There is no end to the variety that may be imported into a colour, so long as the impression of the one colour that has given the keynote remains. This method, besides preserving the essential glassiness of the material, gives a grip and subtlety to the colour which can never be attained by the light and dark of one colour. For the necessary breadth of effect, large masses of colour with the utmost variety within each are essential. White draperies should be treated in the same way, a mixture of warm and cold tints, the warm or cold predominating as is found necessary. For flesh I use various tints, in accordance with the character represented or the colour or tone required. There is absolutely no restriction with regard to the colour of flesh (which, of course, must be in the glass and not painted on), so long as it harmonises with the scheme of colour. I generally cut angels' flesh out of green tint, of various depths as they approach or

recede from the spectator, which all helps the necessary removedness of supernatural beings; the flesh of Christ generally out of warm tint, and other living beings out of tawny or red tints, as the character demands. In early work a deep brownish pink was used throughout for flesh; the nimbus were cut off the heads and in different colours. The objection to this is that all the flesh comes at you at once; besides, it is quite mechanical. I think of a modern imitation of the period, where, in one of the little subjects, the figures are under water, and the flesh is as red as that in other subjects. Right or wrongly, it would be impossible for me to do a thing like that. In Perpendicular work, and, of course, its imitations, the flesh, the white draperies and the canopies and bases are cut out of the same white, which all rushes together, and leaves the little bits of coloured drapery stranded. With regard to the heads, they are cut out of the same piece of glass as the nimbus and painted on, and the hands and feet are frequently painted on a piece of white drapery, and not cut out. An impossible style, if strength, tone and character are considered essential. It may be thought that my treatment of flesh is pictorial, but it is not so. It is just as much a convention to cut the flesh of angels out of cold or cool tones, as that of living beings out of warm tones, as to cut them indiscriminately out of one tint; but it is one which lends itself to greater harmony. I know a church filled with figure subjects where all the flesh is cut out of ruby. This is a convention you like, but a very hideous one.

Another very important point to be considered when selecting, and which has never hitherto been thought of, is that of *timbre*. That is to say, brilliant objects should be cut out of brilliant glass, dull and solid objects out of duller, more opaque glass, that would suggest solidity without having recourse to paint, so that even the deepest tones of a window may preserve their translucency. The various materials must be regarded as the instruments of the orchestra, each of which has its individual tone-colour or *timbre*. Thus there is the brilliant sharp colour that would bring out a melody like the oboe; then the more mellow but still rich colour that would suggest the violins; then material of such tone and texture suitable for background purposes, that would suggest the low strings and drums; again, a rich "Early English" gold ruby that would suggest the thrilling tones of the trumpet. All these should be welded together in like manner to produce the effect of a rich, mellow and powerful symphony.

The glass is cut with a diamond or a hard steel revolving wheel, assisted with pliers to groze or trim the glass to shape. Glass varies considerably with regard to the ease or difficulty with which it may be cut; but it is a rule that the better the glass the more difficult it is to cut. Think of cutting glass half an inch or more thick to a shape. In such cases even pincers have to be brought into use. I believe one reason why Powell's glass is not more used is that it is not so much annealed as other makes of "Antique." It is consequently more brittle, and can be cut with less certainty. Thus, to the greater cost of the best material must be added the greater cost of cutting and the waste in broken pieces, to which add the cutting of the sheet and the extra pieces of colour for painting.

We have now reached the painting stage. The first step is to trace the outlines of flesh and drapery, of course, in vitreous colour, viz. oxide of iron, ground in water, and fatter or made workable with treacle. Lay the cartoon on the bench and you will be able to see the lines of it through the flesh tints. Lay the light colours and the sheet-glass which you are going to paint on. When traced the glass is given a comparative light or tacking fire. We now require a large piece of plain glass, to be used as an easel glass, to which the glass that is to be painted is affixed with a mixture of beeswax and resin made hot. The coloured glass may also be added, and as this is the first time we have seen all the colour together, alterations can be made in it at this stage if necessary. The colours used for painting are of an amber or earthen sort, though oxide of iron can be added to give body. It must be remembered that the colours of the window are in the glass, and that the colours for painting are simply different degrees of warm and cold shade tints. A window is usually painted in one colour throughout, but that need not necessarily be so. The tone of colour can be adapted to different objects. For instance, a cold white can be painted in a cooler tone, and in some cases a pure black can be used. The colour, which is again prepared in water, but with gum as the medium, is laid all over the glass in a flat matt, which, while moist, is stippled with a tool called a badger. This stippling gives a granulated surface which helps the texture wonderfully. When dry, the colour is gently loosened with the finger where the lights should come, and dusted off with a soft brush. As much as possible should be done with the finger; it gives more character and better texture. This process of modelling the lights is continued with hog-hair brushes, and a quill to take out the high lights; the flat tone should be left for the half-tones and shadows. When fired and stuck up again, the shadows are strengthened with oil colour; the same colour prepared with turpentine and

* A paper read before the Architectural Association by Mr. S. Sparrow on Friday evening, February 20.

il of turps as the medium. Especially is this necessary in the
esh, to give character and expression. The dry surface of
e glass is first washed over with oil of tar, to let the colour
ow freely. It is not essential that every piece of glass should
e painted. On the contrary, if there is sufficient tone in the
lass, it is better not to paint, but to let the varied markings
nd tone of the glass speak for themselves. The shadows will
en possess more translucency than if painted. Light glass
eavily painted is much more obstructive to light than richly
coloured glass but slightly painted.

I cannot leave the subject of painting without alluding to a
ind of painting that is no painting. I mean "backing," as it
called. This is to lay a matt of colour on the back of the
lass, and then partially remove it, for no other purpose than
o make the glass look dirty and old; to give it, in fact, that
one which the glass itself lacks. From the assiduous way in
hich some firms plaster the back of their windows with colour,
nyone would think that the chief attraction of the old glass
as derived from the accumulated dust of ages. The parts
hat require it are now stained. Although this is called
stained glass, and we used to be called glass-stainers (we are
ll artists in stained glass now), there is only one stain—a pre-
paration of pure silver, which stains the whites yellow. It is
ixed with yellow lake to reduce its strength; and this, being
vegetable colour, burns away when fired again. The glass
s now ready to be put together by the glazier.

As already remarked, it has been usual to regard the lead
s simply a means of holding the glass together, consequently,
o employ an insignificant lead throughout. But if we regard
he lead as an important factor in the design, we must use
eads of various widths and of a bolder character. The pro-
ortions of the lead must be adapted to the size of the window
nd its distance from the spectator. That must be a very
mall window where $\frac{1}{2}$ inch is too large for the principal lead.
n large windows a $\frac{3}{4}$ inch may be the principal lead; and if
he window is going a great height, 1 inch or more will not be
o much. There must be no idea of shuffling the lead out of
sight. To hide the lead, and use as little of it as possible, is a
characteristic of the pictorial window. A wi dow can hardly
be described as pictorial, where the lead is a prominent
feature. Where leads of different widths are used it is
necessary to mark the outline with different coloured chalks—
ay a blue for the $\frac{3}{4}$ -inch lead, a red for the $\frac{1}{2}$ -inch, while the
black ink remains for the $\frac{3}{8}$ -inch lead. The leading recalls a dan-
ger to be avoided in designing—not to make every piece of
glass of so near a size that at the proper distance one seems
o see the glass through a wire trellising. This is a
langer the mosaic dispensers are apt to fall into. The
eading of the double glass, and of the thick and varied
ieces, offers difficulties. Leading becomes an art. One has
o use a very broad-hearted lead, but sometimes that is not
ufficient; in such cases one has to make a still broader heart
oy cutting the leaf off two calms of lead and soldering the two
earts together; or by paring the leaf away to let the glass
nto the heart and then soldering a fresh leaf over it. Thus
o see another process that is considerably extended by our
determination to use the best material. The lead is then
soldered at the joints and the panel is handed over to the
cementer. It would be more correct to say the puttier.
Whereas in ordinary work of single glass the leads are filled
with cement (a thick paint which ought to be composed of
whitening, linseed oil, white or red lead, dryers and lampblack
to make it a lead colour), in this sort of work every piece of
glass must be puttied on both sides. Copper ties are now
soldered to the lead to twist round the bars, and the window
is ready for fixing. Although I am explaining my methods
thus frankly, I have not much fear that they will be copied.
Not one of them is in the direction of time or material saving,
and any one who copies them will do so at the peril of decreased
profits. In stained glass, as in the other arts, if one would do
good work one must never count the cost.

Now that I have reached the last stage of my discourse,
that section which is to deal with the stained glass of the
future, I am confronted by the hateful task of having to say
something about my own work. It is unfortunately necessary,
because I have to show that the ideas I am about to put before
you are not mere impracticable theories, but the result of
working in the best material. Just as Wagner, when writing
his theoretic works, deduced examples from his earlier operas
(the spontaneous outcome of his artistic need, thus proving
that they were not the result of any preconceived theories), so
I must describe to you my first excursion into the unknown
land, the land of mystery, of light and tone. The window
I am about to speak of was executed some few years ago for
a lady who suggested the subject, "Wotan calling up Erda,"
from the Third Act of Wagner's "Siegfried." I must confess
that at that time the subject seemed an impossible one for
stained glass, and perhaps you will agree with me when I quote
the stage directions:—"A wild region at the foot of a rocky
mountain which rises steeply. Night. A storm rages.
Lightning and thunder, which last, then ceases, while for some

time lightning continues to flash through the clouds. Here the
Wanderer enters. He strides with resolution to the mouth of a
vault-like cavern in the rocks at front, and there stands, leaning
on his spear, while he directs his invocation towards the cave.
A bluish light glows in the rocky chasm. Illumined by this
Erda very gradually rises from the depth. She appears
covered with hoar-frost; her hair and swathings emit a
glittering light." Now the crux of the whole thing was the
supernatural light in which Erda appears, and I must say that
I was very fortunate in finding at that time some "Early
English," which I tempered with Powell's blue on Venetian
opal, that realised the effect perfectly. To my surprise, there-
fore, instead of this subject being impossible in stained glass it
became clear to me that this was precisely the medium in
which effects of light were possible and could best be realised.
I found there were possibilities in the best material which had
never been dreamt of. Besides the supernatural light and the
hoar-frost on the hair and swathings of Erda it was possible to
suggest the tone of night with glass alone; the vigorous action
of Wotan, with his cloak and "beard blown by the night wind,"
contrasted with the mystical stillness of Erda, also the flash of
red in the sky suggesting the subsiding storm.

Pictorial, you will say. Not at all. A pictorial window
would have been a representation of the scene as it takes place
on the stage. But this is an independent conception, con-
ceived in the terms of the material, and producing a result
which could not be attained by any other medium. Let us be
quite clear on this point. A stained-glass window becomes
pictorial when it does such things, or in such a manner, as can
be done as well or better in another medium, *e.g.* in a picture
or wall-painting. It follows from this that there is a class of
subject which is peculiarly the province of stained glass, that is,
the supernatural, in which mystery is the most vital element,
and in producing which effects of light—with which in stained
glass we are dealing directly—are the chief factors.

I will just summarise the ideas I have gained by carrying
out that "impossible" subject. That the subject of a window
should be supernatural and symbolical. That mystery is the
highest and indispensable quality. That to produce that
effects of light and tone are the chief elements. That there
must be a definite tone colour and keynote of colour.
The tracing and painting must be bold and expressive,
wherever it is needed; but as far as possible the glass must be
left to speak for itself, and the leading must emphasise the
important lines of the design. There are some who believe
that the subjects of a stained-glass window are a matter of
perfect indifference; that any trivial thing will do for stained
glass, and who are quite content to fill a window with a
number of single figures. What a colossal waste is that big
twelve-light window I have in view. Four tiers of single
figures. Eheu! Hinc illæ lacrymæ! What an almost
matchless opportunity for a "Last Judgment." But no. That
would be too pictorial (and difficult). Let us go on with our
kaleidoscopic inanities; let us produce a window that is so dull
and uninspiring that one never wants to see it again, even if
the material itself were worth looking at. No wonder that
stained glass is considered such a supernumerary art while
such things are being done. Yet, why should stained-glass
alone stand still and stagnate? Change is the law of
progress no less in art than in human society. If we
are to have progress, it is essential that children should differ
from their parents, although parents, who think themselves
perfect (and even those who clamour most for progress), try to
defeat that law by trying to make their children after their own
image and likeness. But the fact is that no parents are so
good that their children may not be better. Where, again,
would the art of music be to-day if it had been considered
imperative to imitate the first attempts at opera with the
undeveloped orchestra of that day? We should not have had
the crowning glory of the music-dramas of Richard Wagner.
It is just as absurd to imitate old glass as it would have been
for Wagner, when dealing with a colossal and complex subject
like "The Ring," to have confined himself to the orchestra of
Monteverde. Or imagine Tristan and Isolde conversing in
Gregorian tones, accompanied by the sackbut and psaltery.
Away then with these monstrous delusions which have paral-
ysed stained glass so long: "that there is no glass like the
old glass, and there will never be any windows like the old
windows." Away with the imitation that paralyses the
imagination and let us bring whole hearts to the study of the
best material and the natural development of Early work, when, as
I imagine, there was only one kind of glass—the best the people
could make. What then is this natural development of Early
work which I venture to call "the stained glass of the future"?
And why is our development to spring from Early work and not
from fifteenth century and later work? Because the latter was
no intrinsic development of the former, but simply a repetition
in a more elaborate and ornate form. It is still a window of
single figures or small subjects connected with canopies,
consequently it leads to an *impasse*, a *cul de sac*; there is no
development possible on those lines, so it must be ignored.

Let me draw a parallel to the development of the music-drama. First, we have the simple heartfelt strains of songs, loosely connected, answering to Early work. Then there is the period of Italian opera; still the aria form, loosely connected, only more elaborate and artificial, consequently no vital development. This corresponds with work of the fifteenth and subsequent centuries. Then we have the music-drama, a development of the simple song through continuous orchestral melody until it fills the work as an organic whole, giving also to each work its special tone colour. For this latter quality, varied and distinct, yet in keeping with the subjects, I need only refer to "Die Meistersinger," "Tristan," "The Ring" and "Parsifal," and over all the individual style of Richard Wagner. I suppose no apology is needed for my allusions to Wagner and his works, as every man of culture must know something of them; but I have found them of the utmost value, as in them the great principle of unity in variety is so remarkable a feature.

And now, to return from my parallel to the development ahead of stained glass. In the first place, I should regard it as a development that, in an age of commercial production, we consciously choose the best material. Another very important development would be that of regarding a window as a whole—one window, one subject—and not a series of small windows, as the single figures connected by canopies suggest. Owing to the kindness of your executive I am permitted to bring some designs and cartoons, which gives me an opportunity of dealing more effectively with the subject of composition in a window of one subject, and without canopy and base. In the first place, it must be distinctly understood that my desire to treat a window as a whole is not due to any impatience of the shafts dividing the window into lights, but to focus the attention on one subject, instead of frittering it away on a number of single figures or small subjects. The shafts therefore must not be ignored, but clung to, as the ivy clings to the oak. Broadly speaking, the linear design, if a window is to have its due monumental character, should be more or less perpendicular, following the lines of the shafts. Impersonal objects, such as angels' wings, trees, clouds, drapery, the lines of the landscape, may run through two or more lights to help in binding the window together; but the human figure should very rarely extend beyond its own light. The colour design, however, should be horizontal—in strata, as it were. That is to say, the strong colours should be consecrated on the base of the window, as in a musical composition the base is the most important thing; in the middle more neutral tones can be used, and in the upper part lighter and more ethereal tones, thus carrying the subject away into boundless space. The canopy must go, since it is no longer required to divide a window into sections, and as its lightness interferes with the tone of the window. You will see from the set of designs the difficulties one has to contend with in fitting a subject that demands a centre light into a window of an even number of lights. This suggests the idea that the architect, when he has a church to design, might do worse than confer with the glass-stainer as to the scheme of windows, with the view, in some cases, of adapting the shape of the window and the number of lights to the exigencies of the subject. Perhaps this is a counsel of perfection, but, at any rate, you cannot go far wrong in providing us with a centre light. Most subjects from the life of Christ demand a centre light, so instead of four and six-light windows, give us three, five and seven lights.

If, that is, as your President very happily expressed it at your last meeting, you are resolved to think out your work to the uttermost detail; and yet stained glass can hardly be called a detail, it is so important in itself and also in its effect in modifying the whole aspect of the interior. I feel very strongly that the architect should get out a scheme of subjects for all the windows in his church, whether there is any idea of them being carried out at once or not. The subjects would not then be such a hideous and incoherent jumble as they generally are now.

Another development would be a firmer grasp of the colour scheme, based on each window having a definite tone colour in harmony with the subject, and a keynote focussing the colour. Its symbolism must be reconsidered and developed, so that it shall appeal to the Spirit of Reverence (if any such exists) of to-day. Its drawing must be simple, dignified and natural, without affectation of Mediævalism. It will be a development to use paint with discretion, and only where it is necessary to give tone and contour. And finally, by a bolder system of leading show that we regard it as the main factor in the design. Do not think, therefore, that I wish to ignore all tradition, and expect stained glass to begin *de novo* from this moment. On the contrary, it is necessary to study good examples, and see what is the natural form of expression in this art, and what effects have been obtained with limited means. But surely one may study without falling into the rut of imitation; and let it not be forgotten also, that our knowledge is increased by learning to avoid many things that have gone before. On the

other hand, do not run away with the idea that stained glass to be learnt by simply looking at old windows. Before one can make a cartoon for stained glass, before any one can know what style of drawing the painter requires, he or she must have had practice and experience in tracing and painting glass. And yet, within these last few years, a horde of so-called styled artists in stained glass has risen up, and like a plague of locusts, covered the land with works which almost sink in the ground for very feebleness. Stained glass has become a happy hunting-ground for all sorts and conditions of men—black men, black-and-white men, wall-paper men, window-painting men, art students, particularly from those centres of light and leading where there is no technical teacher; any one in fact, who with hand or foot can wield a pencil, and without ever having handled a piece of glass, can presume colour designs and cartoons for this most rich and subtle mediums. And yet these people float. A state of affairs which amply justifies my opening words, "that there is scarcely a subject about which there is greater ignorance than stained glass." I admit that it would have been more satisfactory myself, and, perhaps, to others, if someone else could have written this address; but as I said at the beginning, "only those who have worked in the best material are qualified to speak of the possibilities lying dormant in it."

Let us, then, throw ourselves with enthusiasm into the task of making the best use of the best material, so that by developing it as we develop every other phase of the art, we may produce, by our works of imagination and mystery, the feelings of exaltation, of rapture and devotion it has hitherto been the province of divine music alone to impart.

Mr. LEWIS F. DAY, who proposed a vote of thanks to the author, said the paper contained a great deal that was true and at the present time there was need for the truth in relation to stained glass to be made known. The speaker agreed generally with all that had been said, and especially in emphasising of the facts that glass was the main thing and not the painting, that the glass must be good, and that good glass can be had, as good as ever was made, and that the glory of glass was its colour, and that that was value in the leading of a window. He also agreed with the censure of "backing" windows; in his, the speaker said, in earlier days the process was called antiquation. Good glass could not be procured without paying for it; the costliest, however, was not always the best, for in the making of cheap glass there was often found at the bottom of the pot some good stuff, which the manufacturers did not mean to make. As to colouring, gold ruby was not half so beautiful as copper ruby, and Mr. Day entirely disagreed with the statement in the paper that copper ruby was vulgar. He could not follow Mr. Sparrow when he said he failed to feel the beauty of white windows. He, the speaker, could not visit Salisbury or York Minster or any church where there were Perpendicular windows, masses of silver lights, and think small of white glass. That was reason for the use of white in modern windows. We were accustomed to light nowadays, and it was not only cheap, but which urged people to ask for crystal windows, but the love of light. It was not safe to prophecy, but he felt that the glass of the future would not be brighter and richer, but lighter in tone. The old ideal in glass was to glorify the light that shone through the windows, and that, he believed, was the ideal of to-day, and he hoped it would be the ideal of the future.

Mr. J. D. CRACE, who seconded the motion, said Mr. Sparrow's general principles of the treatment of stained glass were unexceptional. The processes described in the paper were after all those of the thirteenth century with very little variation. The lecturer had stated that canopies must go. He seemed to have overlooked the object of canopies. The great value of a canopy work was not in its ornamental treatment of the window, but the allying of the art to the stone that connected the subject of the windows. The great fresco painters in the past connected them with the architecture of the church in which they were placed, and the architecture more or less assisted the idea that they were connected with the building, and the canopy in windows had this value.

Mr. A. H. WESTLAKE, who was unable to be present at the meeting, in a letter to the President made the following comment:—I have read the paper carefully, but find little light shown upon the future; some I naturally expected from the title of the lecture. Possibly the lecturer thinks as I do, that the best future will come by doing our best, day by day, with straining, although striving. This straining for novelty is painfully shown in modern exhibitions of glass and window-painting cartoons; it destroys the repose so valuable in good art. I must also criticise some few points of the lecture, such as the prominence given to the names of certain glassmakers. I am sure it is not done in the manner of an advertisement, but it necessitates the omission of the names of other glassmakers whose productions are not distinguishable from those mentioned. The practice of "plating" is also advocated evidently as practised by American makers. It is a very

ious form of work, and ought with proper material to be necessary. It is especially pernicious on the point of durability, as the lead of a window is the first part to decay, and then there is the probability of the falling out of one of the panes. Moreover, it adds to the weightiness of a window. A window of good stout glass and lead has always a tendency to cockle irregularly and to tear itself from its copper bands. This irregularity of weight should be obviated and not exaggerated. Addressing myself to the general principle of the lecturer, it appears to me that his first thought is the effect of an individual window, irrespective of the general "coup" of a number of windows, say, in the aisle of a church. Here, less there is some rhythmic bond, the whole of the side of the church loses the proportion of the windows to the wall and each other. This rhythm was found from traditional practice best produced by the repetition of a dominant feature such as is effected by what is called canopywork, and regardless of whether the lecturer says of Perpendicular work or even of Early Renaissance work, the result is most perfect in some churches of these styles. Witness the old glass in the ante-chapel of New College, Oxford, and in the work of Jean Cousin (a great artist) at Sens and Paris. It must also be remembered that "Early glass," such as that at Canterbury, Bruges, Chartres and Florence, is heavily coloured. It was introduced here from France, where the light is better; but even in France on a dull day such glass as that at Chartres prevents anything else from itself being seen. Remember also that much of it was removed from our own churches in the fourteenth century for that reason. As to the relative cost of good work, the question of style has nothing to do with it. Good Perpendicular or Renaissance glass is the most expensive, as white glass, if of any value, requires the best painting (although much that is done now is badly manipulated), and where there is one first-class glass-painter there are fifty moderate cartoonists and thousands of good glaziers employed. Early glass has the least technical painting value. I cannot quite enter into the same or any other musical parallels quoted, such as the likening of golden ruby to trumpet tones, nor can I admit that mystery is the most valuable ingredient in a painted window; neither do I see why angels being supernatural—a word that has no art meaning—should be green-white and Our Lord's flesh warm white. I am unable to consider the questions of the whites of different tones running together in a window are not a defect, but give the effect of breadth, whereas when everything is cut out and juxtaposed with its opposite, spottiness, such as one sees in all second and lower class works, results. I entirely agree with the lecturer, who laments the immigration into painted-glass ateliers of those who know nothing about its requirements. They are of both sexes, and their name is legion.

The PRESIDENT, in conclusion, said he thought there would be a diversity of opinion on the points raised in the paper. The subject encouraged discussion, but it was so much a matter of opinion and taste that it seemed wrong to dogmatise. He agreed with Mr. Sparrow in most points, but it was reasonable and proper for others to hold different opinions.

HERALDRY IN DECORATION.*

THE choice of heraldry in decoration as a subject on which to offer suggestions to the Applied Art Section of the Society of Arts is influenced (apart from the necessity of limiting in some measure the scope of heraldic art in general) by the consideration that, as it was in decoration that heraldry found admirable expression from a very early period, its decorative use in the past is now worth study with a view to the satisfactory execution of modern work.

Primarily heraldry, no doubt, consisted of the devices which distinguished leaders in the field, but its close connection with the personality of its bearer, whom it represented in a very intimate way, also led to its use in every conceivable form of decoration. In costume, ornament and furniture, as well as in the hangings of tapestry and in other mural adornments, it became a striking and universal feature of the artwork of its time. Owing to this strong personal and allusive quality, the employment of heraldic motives in the decoration of buildings has continued, even down to our own time, to show a more marked degree of excellence than was for a long period present in other forms of heraldic expression.

Decorative work was also the direction in which the revival of heraldry, which accompanied the Gothic revival, first showed itself. Perhaps the inherent difficulties of the materials may have suggested the sincerity of the effort to properly employ them.

It will not be necessary (even if time allowed) to go very far into the origin of heraldry. For our purpose it began

about the eleventh century—that is to say, it began to be used and systematised, more or less, as we know it, but in its essence it must always have existed.

The desire to distinguish himself by some visible means seems to have characterised man ever since we know anything about him. Badges are mentioned as the ornaments of kings and chiefs from the earliest historic times, from that of the Chaldean king, 4000 B.C., onwards. Some of these early personal devices were strangely similar to those with which we are familiar in later times. The figures on the sculptures at Persepolis, for example, have veritable crests on their heads, and these also occur on the heads of the king and his heir apparent in contemporary coins. There may even have been some sort of regulations controlling the use of various devices, but we may at least be sure that the powers that were took good care that others did not use their badges if they could help it.

Artistically, our heraldry from its rise in the eleventh century quickly developed a high standard of decorative excellence, flourishing exceedingly, with certain changes of style and method, for 300 years until the middle of the sixteenth century, when its period of greatest strength and beauty ended and its decadence began. As a system it seems to have developed in a natural way on the lines of its own necessities, as did its artistic expression in a great measure, but the latter owed much to previous design, and mainly through the influence of the textiles and other importations (sometimes brought by returning crusaders) helped to perpetuate in the Western world the lions, eagles and strange and characteristic composite animals of the East. These ancient prototypes of heraldic forms are singularly interesting, and concern us here because they sometimes possess in a marked degree qualities which teach valuable lessons that are applicable to present use. This will be discussed presently.

Although at first the Mediæval draughtsman followed the drawing of his imported or traditional motives with considerable closeness (as in the lions of one of the thirteenth-century MSS. in the British Museum), he soon began to treat them in the way that came to be considered peculiarly heraldic. In thus handling his motives he was entirely himself, and the outcome was the natural result of that splendid sense of design which distinguished him. The style is, rightly considered, purely heraldic, because it arose from its own heraldic conditions, and was the result of the very sane intention that the thing done should be suited to the use to which it was to be put, viz. to serve as a distinctive badge which could be seen and easily read at a distance, and in many cases when in motion. To this end the object was drawn as large as the containing space would fairly admit, and its form was attenuated so as to allow the ground colour to show through in due proportion, and so effect clearness of definition. Vigorous draughtsmanship also contributed to the splendidly decorative effect that was due to good distribution, and the fine balance of colour that results from it. Thus the treatment which was suggested by reasons of practical convenience resulted in an effect of great decorative value which also afforded opportunity for the use of expressive line. It is interesting to contrast this treatment with that of the later Renaissance, such as the naturalistic lion by Della Robbia, which would have become an undistinguishable blob at a distance at which the attenuated form would have been quite effective. In a similar way an eagle drawn in the ancient way, with the wing-feathers strongly divided, was at once more distinct and more decorative than its Renaissance successor.

Another practical consideration, the need of readily repairing the damage caused in action to the actual shield, dictated the flat and simple treatment of much of the painted decoration. A similar simplicity occurs in some of the MSS., especially in such as are of large extent or of frequent repetition when economy of time and labour was desired. When, however, circumstances allowed, time and skill were not spared in the elaboration of the work. It is, of course, for this reason that the heraldry in architectural decoration is generally found to be among the best work of its period.

In the ceremonial shields this elaboration is very great. They were made of layers of various materials, such as canvas stretched on wooden frames, and the changes were then modelled in gesso, and afterwards gilt and painted, or were fashioned in stamped leather and pinned down to the surface. The spaces were diversified with the beautiful tracery known as diapering, and the whole result was rich and beautiful in the extreme. Large numbers of these shields were made in Italy down to a late period. A most admirable English example is the shield at Canterbury Cathedral, said to be that of the Black Prince. Here the lions are admirably distributed, full of power and life, and less extravagantly drawn than those of John of Eltham at Westminster Abbey, but they lack something of leonine character. The *fleurs de lis* of France are beautifully free and graceful, and though so dissimilar in shape to the lions are equally well designed to occupy their spaces and equally well proportioned to them. The whole

* A paper read before the Applied Art Section of the Society of Arts by Mr. George W. Eve.

work, which is so excellent an example now of some of the best qualities of heraldic design, has suffered from the wear of the centuries, but when it was uninjured must have been superb. The lack of leonine character in the lions might naturally be expected when it is remembered that they were the descendants of generations of copies, and therefore were not consciously generalised from objects seen by the artist. Even when he did see a lion his acquired ideas were too strong for him, so that one in a thirteenth-century book of sketches, though noted in the margin as "drawn from the quick," is very like its patternlike fellows.

Whether the treatment was simple or elaborate, however, its breadth of effect and decorative quality were nearly always conspicuous. These various methods, both satisfactory in their way, are of special interest to those who require historic sanction to a choice of treatment, in opposition to the opinion that, as certain methods of work or works of a certain period are good, they are, in addition, perfect and everything else is wrong. So when a flat treatment in harmony or contrast with surrounding decoration seems desirable, the armorials may be done flatly, and when on the other hand a more elaborate treatment seems fit, modelling in relief, or any other suitable means of decorative effect may be employed. The old work itself, full of variety and freedom, teaches us how to look at the subject without pedantry, but not without knowledge. It teaches the right of individual treatment combined with selection, and illustrates in a measure the essentially artistic principles taught to Kipling's primæval ballad-maker by his totem—

There are nine-and-sixty ways of composing tribal lays,
And every single one of them is right.

It is not meant, however, that ignorant and reckless scribbling is right. Order as well as freedom is necessary, and this can only be secured by a study of the subject from all points of view.

The early treatment of the crest, helm and mantling will also amply repay study. Being made of light material, and having its weight, which was still considerable, supported by the shoulders on which the helm rested, the crest was of conspicuous size and is so represented. In early times it is said to have been one of the privileges of knighthood, and this would additionally explain its emphasis. The helm was usually that known as the great helm, to distinguish it from the helmet, basinet or other form of head armour. The latter, having a visor or front which opened, and a movable neck, came into use in the fifteenth century to meet the desire for lightness and mobility in actual battle, and thenceforward crests and the great helms that bore them were reserved for the tournament and other military solemnities. There was another especially practical reason for this disuse. It had been found that a crest was a dangerous ornament in actual battle, for at close quarters it served as an excellent handle by which to pull down the wearer's head. King Stephen is said to have been taken prisoner in this manner. The mantling, which was at first quite simple, soon became of the greatest value as an element of composition, and the importance of its free possibilities of line was quickly recognised. From a mere representation of the helm drapery, it thenceforth developed through various forms until it became in many instances similar to the contemporary architectural tracery, when, as in the fifteenth-century carvings, it surrounded the shield and ornamented the surface of the panel in a very complete and beautiful way.

By the Tudor time heraldry had ceased to be used in war in the old way, with such exceptions as banners and the decorative and emblematic shields on ships of war, and it, of course, remained an essential part of the tournaments while they continued to exist, but heraldry in the main became merely decorative thenceforward, retaining, of course, its allusive and symbolic qualities. In this way it greatly increased, thus sharing in the impetus given to the arts by the end of the Wars of the Roses. At this time a remarkable number of simple flowers came into heraldic use, columbine, gilly flowers, marigolds, honeysuckle and many more appearing not only as arms but in garlands as decorative accessories.

By this time also the shield shapes had become less simple, following in their cusplings the fluted armour of which they formed part, and others of which large numbers were designed by the little masters were frank applications of the decorative scrolls of the time. The concave shield whose raised edges took the light and helped to define the form, while assisting, together with the shadow within it, the distribution of light and shade, became much in use.

Some of the early Renaissance heraldry retained much of the excellence of the preceding Gothic as regards the pose of the figures and the general composition, and it attempted, in addition, the characterisation that was wanting in the earlier work. In many respects it was very admirable, and seems, in its individual thought working on some of the suggestions or traditions of the older style, to suggest the lines on which

modern heraldry might develop. At the same time there, a more naturalistic school, of which the heraldry in Robbia's work may be taken as the expression, and this also interesting, but as a warning. It most unfortunately empowered the more decorative style, and ultimately developed into the feebleness which characterised the heraldry that preceded the revival in the last century.

A well-known example of the better Renaissance is a plate by Albert Dürer, of a shield bearing a rampant lion; this plate there is also evident a desire to render the more cloth-like, though still complicated. Mantling afterwards followed the influence of the conventional leaf forms of the Renaissance.

I have ventured to give you this slight sketch of the development of the artistic side of heraldry, not as a historic retrospect, but because it is in the study of old work that guidance is to be found for present requirements. By this connection, a word of warning may perhaps be permitted against making a fetish of the work of any period, however good. Another is against mere copying of old examples, ever excellent, except, of course, for purposes of study. Merely to copy bits of heraldic precedent and to piece them together is not the way to make an artistic thing at all. A copy has no vitality of its own, and cannot even reproduce that of the original, for it is more than doubtful if it is possible to reproduce the spirit of work done under other conditions and modes of thought. Even Pugin, to whom the revival of decorative heraldry owes so much, with all his sympathy, and with all his powers of draughtsmanship, cannot be said to have altogether caught the intense vigour of his originals.

Again, hardly anything possesses at the same time all the good qualities that it might have, and we sometimes excuse the absence of one because of the supreme way in which another is expressed. In doing new work a broader view is necessary if it is to result in anything but a shadow of a former style. Heraldry should be expressive, interesting and decorative in original treatment, and exhibiting the qualities that the best of the old work teaches us to desire, rather than being a copy of it. The term "original" here does not mean extension by means of wild arrangements of weird lines, which perhaps original in the sense that there is nothing like them on earth, but rather the originality, or perhaps I should say individuality, which comes from serious attempts to express qualities rather than to copy styles.

The artistic expression of heraldry may be regarded in two ways—as a representation of an actual shield, crest, helm, so forth, as they would be represented in a picture, of a tournament, for instance, or as a presentation of the essential hereditary facts, in the way that is thought most expressive, but with too much regard to preceding styles. The former seems more suitable to ancient and historic arms, and the latter to be likely to harmonise with modern decorative surroundings as well as to possess more vitality and variety in itself.

This harmony with surrounding decoration is one of the essentials of design that should be continually kept in mind. Another condition, equally important, is suitability to materials and methods by which the design is expressed. Two very obvious points cannot be too often insisted on, however wearisome the reiteration, for they are even frequently ignored. One hears of shields painted on velvet (with all the detail and finish to which that beautiful material lends itself), sent as a substitute for a working drawing, large embroidery or carving, and accompanied by instructions that they must be strictly followed. Or of friezes and panels of which the different parts, heraldic and ornamental, have been done by different designers working in ignorance of other's design. The general design is made perhaps of drawn and graceful lines, with spaces where it is thought probably correctly, that the shields would tell. Then a sketch, perhaps a mere diagrammatic note of the arms, is produced enlarged to the right size and blindly copied. Of course the result is patchwork. Careless treatment of heraldry soon pervades applied art, and so to spoil what is otherwise meritorious work. Much incongruity arises from fear of improving the drawing or composition may violate heraldic rules, and this brings us to the necessity for acquiring sufficient knowledge of the subject as will enable the designer to know what points are really essential, and therefore to be carefully retained and accentuated where accent is proper, and what, on the other hand, may be modified or ignored. A knowledge of the system of heraldic description, called blazon, is absolutely necessary to this end. Pedantry in non-essential matters is of course absurd, and artistic freedom is always to be desired, but there must first of all be a basis of knowledge on which to work.

It will be necessary to study the subject sufficiently to distinguish between the essential principles (such as underlie the old good work) and the later amplifications of rules for pedantic insistence on regulating every detail, however unimportant, which were made when the legal mode of thought had displaced the artistic one. The rules that are necessary

vent confusion will be found sufficiently elastic to allow of variety of treatment.

Among the qualities that it will be desired to express are proportion, distinct definition, good distribution in filling spaces, strongly characterised and well accented forms and a vigorous pose.

The proportion of the parts of a usual form of heraldic shield, crest, helm and mantling to each other remained fairly constant from the end of the thirteenth century to Tudor times, and may be taken roughly to be two-fifths of the whole height for the shield and three-fifths for the helmet and crest. This merely as a practical guide. I need hardly say that it is not to be taken as an actual measurement, but only as suggesting the relative heights in the design. The character of the crest, whether broad and solid or tall and slight, would affect this. The result of these proportions is to bring the helm a little above the actual centre of the design, where it forms a satisfactory point on which the other objects group themselves.

With regard to the proportions of ordinaries to their fields, any rules to be found in treatises may be safely ignored. In good work the ordinaries vary in size with the requirements of distinctness in respect to the other charges, and their variation in this way has no other significance. I do not, of course, deny the usefulness of points of proportion; they may be useful so long as it is recognised that they are approximate and variable guides instead of dogmatic inflexible rules. With regard to charges it is equally impossible to say what exact proportion they should bear to the field, nor in most cases could we measure it if we did. It must be a matter of artistic perception which decides whether a space is properly filled. In any case the proportion would be an apparent rather than a scientific one, and would be greatly modified by circumstances, colour, for instance. I need hardly point out that the actual measurements would not be the same for a white object on black as for a black one on white. It is curious how prevalent the desire has always been to reduce to exact rules matters that are insusceptible of that kind of control. The sixteenth century efforts at a geometric way of drawing letters and the attempt to regulate minutely heraldic drawing are instances of a peculiarly wrongheaded way of approaching matters essentially æsthetic.

As to the animal forms, vigour is of the utmost importance, together with strong characterisation. In this connection the lions of the Assyrian reliefs are very suggestive. The expression of strong, leonine character by means of the accentuation of the muscular masses is a method that lends itself well to heraldic design. The composite figures are also well worthy of study in relation to the griffins and other monsters of later times. Gerard Leigh, writing in the middle of the sixteenth century, has something to say about griffins; they are, as you know, half eagle and half lion, which students of natural history may like to know, thus:—"Griffins bear great enmity to man and horse; though the man be armed and on horseback, yet they take the one with the other quite from the ground and carry them clean away. I think they are of great hugeness," he goes on, "for I have a claw of one of their paws which should show them to be as big as two lions." In another place Leigh refuses to believe something because "he had not seen the proof thereof."

It will be well to consider animal pose in relation to the anatomical possibilities, and the qualities of dignity, strength or grace which are associated with certain charges should also find due expression.

The schemes of arrangement that suggest themselves as suitable to decorative purposes, are very various. Complete series of family arms and those of alliances, together with the honours conferred on individuals; arms of successive owners; shields marking the visits of distinguished guests and so forth.

Unity of plan, such as when the arms are arranged in relation to some central object, as the altar in a church or the fireplace in a room, for example, is, of course, desirable. In the latter case the central position would be appropriately occupied by the entire armorials.

The employment of badges in decoration opens up a large and interesting field of design from their value as decoration in places where shields of arms are not so suitable. Though not subject to the same rules as the regular arms, they were still regarded as of great though secondary importance, and became practically hereditary in many cases. Time, however, will not permit of their adequate treatment here. A kind of badge, more ephemeral in character, called an impress, was a fashion that came to us from Italy, as many other heraldic fashions did. They were devised from mere fancy, and consisted of a device with an explanatory motto. Henry VIII. and his knights at the Field of the Cloth of Gold bore a series of devices, of which they wore part each day until the whole was complete. Cosmo de Medici had a tortoise with a sail attached and the motto, "Festina lente," and there were others innumerable. Like other heraldic matters they sometimes led to quarrels. A knight who strutted up and down at the court

of King James had a falcon embroidered on his sleeve, and the motto, "I bear a raven, fearless in flight, who checks at him his death is nigh." Then a Scottish knight saw the device, and after a while appeared with another. His was a raven with a piece of meat, and its motto said, "I bear a raven picking at a piece, who pecks at him, I'll peck at his nose." The story goes on that in the arrangements for the consequent fight, the Scottish knight, who had but one eye, demanded that his opponent should lose one of his in order to be on an equality.

There will not be time to do more than briefly allude to colour treatment. It will suffice to say that it is not at all desirable that heraldry should scream in mural decoration, however necessary it may have been to do so in the field. So long as the tinctures are distinguishable with sufficient clearness any modification of tint may be used, and the colour may be broken by means of diaper or other surface treatment that may be desirable in order to make the heraldry take its appointed place, always avoiding, however, any interference with the clear statement of the heraldic facts. The decoration may be modelled in gesso and treated with monochrome, so as to emphasise the modelling, or in many another way that practice will suggest.

The revival of the art of enamel also offers a splendid material for heraldic work. The series of works in enamel on the monuments, and, above all, the early stall plates of the Knights of the Garter at Windsor, are too well known to need more than an allusion to the magnificent field of study they afford; but it may perhaps be permitted to hope that the beautiful art of enamelling, which (though its revival is less than twenty years old) is fully capable of worthily following its long-ago predecessors, may have some day an opportunity of doing so.

The value of heraldry in domestic decoration is also obvious. One can hardly imagine anything to excel the gem-like effect of armorial enamels on the dark panels of a library, for example.

Whatever be the material in which heraldry finds its means of expression, it is permitted confidently to hope that the wide and increasing interest that is being extended to the subject may result in the production of work that is not unworthy to follow the best of its predecessors.

TESSERÆ.

Sculpture and Painting.

THE principles of excellence in painting are so distinct from those of sculpture that the highly elevated character of general or ideal nature, so appropriate to the perfection of the latter, is perhaps scarcely compatible with that of the former, which, being a more complete imitation of its objects, requires a stricter adherence to their individual peculiarities. In sculpture we have only the forms and lines of expression, so that a statue is, in itself, but an abstract imitation, and consequently is employed to the greatest advantage in exhibiting abstract nature; but in painting we have also the glow of animation, and the hues, as well as lines, of passion and affection; wherefore, as less is left to the imagination, the tone of imitation must be brought down nearer to a level with the individual objects with which it will be compared and by which it will consequently be judged. In this respect the difference between sculpture and painting is similar to that between epic and dramatic poetry. In the picture and upon the stage the imitation, being immediately addressed to the organ of sense, and entirely dependent on its evidence, requires in many cases, and admits in all, a stricter and more detailed adherence to the peculiarities of common individual nature than either of the sister arts will ever allow. Many of our most affecting tragedies are taken from the events of common life, but no beauty of verse nor felicity of description could make us endure such things in epic narration. In the same manner some of the most interesting and affecting pictures that the art has ever produced are taken from similar events and treated in a similar style; in all of which the pathos is much improved, without the picturesque effect being at all injured by the characters and dresses being taken from common familiar life. But in sculpture this could not be borne, that art never having made any impression or excited any sympathy by exhibiting common individual nature. Even in their portraits the sculptors of the fine ages of Greece always took the liberty of enlarging the features and invigorating the expression, of whatever kind it happened to be, and if they employed drapery it was always of that particular sort which is peculiarly appropriated to the art and which may therefore be properly called sculptural drapery.

Gothic String-Courses.

String-courses may be regarded as the successors of the horizontal lines by which Classical is principally distinguished from Gothic architecture, and the importance of them will be

felt when it is remembered that all masonry is made up of successive layers, so that they form a most genuine piece of decorative construction, and are almost essential to the feeling of repose. They consist of projecting ledges of stone carried below windows, both within and without, round buttresses and other angular projections, and in cornices, parapets, tower-stages and other parts of edifices, used as dividing lines to set-off one particular portion as distinct from another. Though subordinate, and seemingly insignificant, details, they are of the greatest possible importance in imparting a character to a building. Sometimes, breaking playfully from the horizontal, they rise in graduated and rectangular heights. Sometimes carried over a doorway or round an arch; now dying into the wall; now, as it were, passing into some interrupting projection, and, nothing baffled by it, reappearing on the other side; now starting aloof into a window label, and playing the most fantastic tricks before again descending. A string-course at once relieves naked masonry, and blends into a whole the seemingly detached portions of a rambling and irregular construction. In most cases, especially in windows, it forms a real drip or weathering, and of course adapts its upper surface to this end. Hood mouldings, when used internally, cannot be said to have any real use; but they form a decorative finish of too important a kind to be neglected with impunity.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting was held on Monday last, Mr Aston Webb, A.R.A., presiding. It was resolved that, subject to His Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be awarded this year to Mr. Charles F. McKim, of New York, for his work as an architect.

At the ninth general meeting of the session 1902-3, following the special meeting above referred to and similarly constituted, the minutes of the meeting held on February 16 were taken as read and signed as correct.

The PRESIDENT referred to a circular recently issued to architects and others, headed "A Government Diploma for Architects," and said that the Council were still opposed to any such scheme of registration as that set forth in a previous Bill dealing with the same subject, but when the details of the proposed Bill were before them and had been duly considered the Council would be prepared to give their definite views as to the course to be taken.

Mr. John Robert Moore-Smith attended for the first time as Fellow.

The following were elected as Fellows:—Wilfrid Ainslie, Sir Robert Rowand Anderson, LL.D., F.R.S.E. (Edinburgh), Thomas Edwin Cooper, Herbert Davis (Scarborough), James Macintyre Henry (Edinburgh), Walter Stirrup (Blackburn), William Angelo Waddington [A.] (Manchester), John Henry Townsend Woodd, M.A. Cantab., Arthur William Yeomans (Chard, Somerset); as well as the following Associates—Robert Bennett (Buxton), William Edward Brooks, Frederick Billingham Chester, Walter St. Leger Crowley (Cardiff), William Greenwood (Blackburn, Lancs), John Hindle Higson (Blackburn), Joseph Holt (Wilmslow, Cheshire), Charles Henry Hopson [Colonial examination] (Canada), Henry Joseph Bissaker Hoskins (Birmingham), John Ivor Price Jones (Cardiff), James Morton Lethbridge, Thomas Forbes MacLennan (Edinburgh), Thomas McLaren (Montreal), Charles Ernest Monro (Glasgow), George Salway Nicol (Birmingham), Charles Edmund Lancaster Parkinson, Frank George Richardson, Nathan Thomas Salmon (Reading), Stanley Towse, William Henry Watkins (Bristol), Horace White, Francis Carr Wrigley. As Hon. Corresponding Member:—Constant Moyaux, Member of the Institute of France, President of the Société Centrale d'Architectes Français, Paris.

Chepping Wycombe Town Hall Competition.

SIR,—I am desired by the President of the Royal Institute of British Architects to ask you kindly to give publicity to the fact that the Corporation of Chepping Wycombe, having altered their conditions to meet his views by adding to clause 3 after the words "themselves prefer" the words, "but it is the intention and wish of the Corporation to accept the assessor's award unless there should appear any valid reason to the contrary," and having extended the time for the delivery of designs to April 4, he has consented now to nominate an assessor.—I am, yours faithfully,

W. J. LOCKE, Secretary.

Royal Institute of British Architects: March 3, 1903.

GENERAL.

The Duc Loubet has given 10,000 francs to the directors of the French School at Athens, in order that the excavations in Greece, and especially those at Delos, may be continued.

A New electric railway, about eight miles in length, connecting Portsmouth with Horndean and Waterloo, opened on Monday. The cars—of the tramway pattern—worked by the overhead trolley system.

The Memorial of the late Archbishop Temple in Canterbury Cathedral is to take the form of a figure, recumbent otherwise, of the archbishop in bronze, the architectural superintendence of the work being entrusted to Mr. W. D. Carr-Saunders, architect to the dean and chapter, and the execution of the sculpture to Mr. F. W. Pomeroy.

Mr. James Mansergh, C.E., ex-president of the Institution of Civil Engineers, and consulting engineer of Birmingham waterworks, will receive the honorary freedom of Lancaster March 24. An address by Mr. Mansergh dealing with the water supply of Birmingham will follow the formal ceremony.

The Restoration of Allhallows Church, near Rochdale, which dates from Norman times, is now completed. The whole cost has been defrayed by public subscription with the exception of the chancel, the renovation of which was undertaken by the Ecclesiastical Commissioners.

Motor Fans are to be introduced as early as possible, to carry the new financial year into the sick bays of all His Majesty's ships.

The Site of the King's Sanatorium is not definitely settled for negotiations are in progress between the advisory committee and Lord Egmont for the acquisition of a site, known as Lord's Common, almost midway between Midhurst and Fernhurst. The land, 120 acres in extent, lies at an elevation of 600 feet above sea level, is sheltered on the east, west, and north, has a splendid south aspect, and stands about half a mile from the main road from Haslemere to Midhurst. There are no dwellings nearer than a mile.

A Sum of 7,500*l.* was voted by the House of Commons for expenditure at Marlborough House. The money is devoted to the repair of the drains at Marlborough House. The delay in the commencement of the work was due in the first place to the presence of guests for the Coronation, and in the second place to the illness of Professor Corfield, the sanitary inspector for the Board of Works. The whole undertaking is now almost completed. The total expenditure has been 12,000*l.*

Mr. Davis, an American who has already spent much money on explorations near Thebes, on the Upper Nile, has recently covered a splendid chariot in the tomb of Thothmes IV. (XVIII. Theban Dynasty, B.C. 1533). The fittings are of bronze and the rest is gilded wood. The chariot is full-size, and has been valued at 5,000*l.*

Princess Christian will lay the foundation-stone of a new parish church at Summerstown, Tooting, on April 1. The original church, built in 1835, was condemned by the London County Council in 1893 as a dangerous structure, and it was taken down. The new church, to seat 800, will cost 8,400*l.*, and the fittings 800*l.* Mr. Godfrey Pinkerton is architect.

The Supreme Court of Washington has decided that there is a limit in law to the height of buildings, and that it is 90 feet. If it should be necessary to attain a greater height, the builders should be compelled to purchase the rights of the community to all the space above. This is a new interpretation of the maxim in English law, "Cujus est solum est usque ad cælum."

Messrs. Kidston & Co., of Glasgow, have been awarded the contract for the supply of 25,000 tons of steel rails for the Government railroad, in competition with American, German, and Canadian firms.

Sir A. Binnie has prepared a report on the drainage of the Aldington district, which is closely connected with Brixton and Hove. He recommends a separate outfall to the sea in the vicinity of Shoreham Harbour. The works will probably cost 200,000*l.*

The Belfast Harbour Commissioners have agreed on the construction of a graving dock, at an estimated cost of 299,000*l.* It will be 750 feet long, 96 feet wide at the entrance and 100 feet wide at the bottom. The depth will be 12 feet from the blocks to ordinary high-water level, and some 16 inches will be allowed for the blocks. There will also be a fitting-out jetty 600 feet long.

Sir Wm. B. Richmond, K.C.B., R.A., will give a lecture on the decorations of St. Paul's Cathedral to the Incorporated Institute of British Decorators on Monday evening next at the Painters' Hall, E.C.

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 5,000l. Premiums of 60l., 25l. and 15l. will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

CASTLEFORD, YORKS.—March 31.—Designs are invited for a free library. Premiums 15l. and 10l. respectively. Mr. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—April 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, Wycombe.

FENTON.—April 30.—Designs are invited for a public library. Premiums of 60l. and 30l. are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—March 15.—Designs in competition are invited for a memorial of the Hull soldiers who fell in the South African war. Mr. E. Laverack, town clerk, Town Hall, Hull.

HULL.—March 31.—Designs in competition are invited for extension of the town hall. Premiums of 300l., 200l. and 100l. are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000l. Premiums of 75l., 50l. and 25l. respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

SUNDERLAND.—April 30.—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100l., 50l. and 25l. will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

TASMANIAN SOLDIERS' NATIONAL MEMORIAL.—A premium of twenty guineas is offered for the best design for a national memorial to be erected to Tasmanian soldiers who lost their lives during the recent war in South Africa. The cost of the memorial must not exceed 1,000l., and full particulars can be had on application to the Agent-General for Tasmania, 5 Victoria Street, S.W.

YEOVIL.—April 10.—Premiums of twenty and ten guineas respectively are offered for the two best schemes for laying-out a piece of land on which it is proposed to erect a town hall, municipal buildings, markets, &c. Particulars may be obtained from the Borough Surveyor, at the Town Hall.

LONDON'S FIRE EXHIBITION.

SIR HENRY TRUEMAN WOOD on behalf of the Council of the Society of Arts has intimated to the advisory committee of the International Fire Exhibition, 1903, that the Council has decided to offer gold, silver and bronze medals for certain classes of modern fire-extinguishing and life-saving appliances to be exhibited at Earl's Court. For the best chemical fire-engine for town use shown at the exhibition the Council offer one Society of Arts gold, two silver and two bronze medals, and also similar awards for the best and most easily-worked long ladder exhibited which will reach the sill of a window 80 feet above the level of the pavement, and which can be rapidly transported over roads not more than 25 feet wide.

NEW CATALOGUES.

AN important feature of the new catalogue just issued by Messrs. W. F. Stanley & Co., Ltd., of Great Turnstile, is the capital series of designs for stencil plates, of which a large variety is shown, including cardinal points, corners, letters of many forms, &c. Illustrated descriptions of theodolites, gradiometers, levels, and calculators in great variety are also given.

MESSRS. SHANKS & CO, LTD, Tubal Works, Barrhead, send us a copy of their new supplementary catalogue of baths and bath-room appurtenances, in which this firm is constantly introducing improvements. The illustrations, which are admirably rendered, contain suggestions for ideal bath-rooms, and the prices of all the various appliances and accessories are given in plain figures so as to enable anyone to make an exact estimate of the cost of a proposed installation.

TRADE NOTES.

THE new three-dialled illuminated turret striking clock in Eltham town hall was set in motion on Saturday last before a large gathering of the inhabitants. The clock was fixed as a memento of the coronation of Their Majesties the King and Queen, and was made and fixed by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds and Newcastle.

MESSRS. GEO. G. BLACKWELL, SONS & CO, LTD., The Albany, Liverpool, advise us of the death of Mr. Isaac Roberts, their traveller, whose lead business they took over some six

months ago owing to his liquidation. They have erected at their Garston Mills, under his own supervision and on his own methods, a special grinding plant by which they grind to the particular fineness so essential to the trade, who can therefore fully rely on being well supplied with the very best article in quality and fineness. The late Mr. Roberts's position will be filled by Mr. E. S. Blackwell.

BUILDING AND BUILDERS.

THE foundation-stone has been laid of a new English Wesleyan church, which is being erected at Llangollen. The church, which will be in the Gothic style, from designs by Messrs. Morley, of London, will accommodate 400 worshippers. It is being built with Cefn stone at a cost of 4,000*l*.

THE foundation-stone of a new receiving house for children, to be erected by the St. Pancras Board of Guardians, has been laid at Leighton Road, Kentish Town. It is to be used as an intermediate school, where children will be placed while under medical observation and pending their removal to Leavesden, instead of, as at present, spending the necessary interval in the workhouse. Places will be provided for sixty children.

MR. EDMUND PEARSE BURD held an inquiry at Ashton-under-Lyne concerning the application for a provisional order to amend the local Act of 1893, and a subsequent order of 1900. The Corporation have borrowing powers to the extent of 35,000*l*. for the purpose of converting the town's closets to the water-carriage system, and something over 18,000*l*. of this has been already spent. It was explained by the town clerk (Mr. F. W. Bromley) that it was desired by the Corporation that the expenses incurred by them, which are heavier than was first expected, and often necessitated rebuilding outhouses, in carrying out the work of conversion should be "private improvement expenses," so that the repayment by the property-owners of the cost of the work might be extended over a number of years, instead of being recoverable in a lump sum, as at present, the owners to pay interest in the usual way. Evidence was given and the inquiry closed.

THE new offices shortly to be built for the Hearts of Oak Benefit Society will be from the designs of Mr. C. Meaby, architect, of 88-90 Chancery Lane, London.

SILICATE-OF-LIME BUILDING STONE.

IN our issue of January 23 we gave a short notice of Mr. L. P. Ford's valuable discovery of how to produce the long-desired silicate-of-lime stone, and we have now much pleasure in giving a more detailed account.

Mr. Ford first called his stone by the fancy name of Crown Dale, but now, on forming a syndicate, he has altered the style to that given above, which is an exact description of the article, namely, a combination of silica and lime, with no other addition except oxides of metal for colouring purposes. The stone is composed of only about 95 per cent. of properly graded silica sand, and about 5 per cent. of unslaked fat lime, and depends for its strength upon the expansion of the lime when put through the process, and the beautiful mechanism of the mould boxes.

The desirability of having a true silicate-of-lime building stone is recognised by almost every text-book on building, and numerous attempts have been made to produce it during the last 75 years, both here and on the Continent, but although Ransome in England, Zernikow and many others in Germany succeeded, their processes were far too expensive, and they could not avoid cracks and flaws which caused too great a waste. The consequence is that we find the industry practically, if not entirely, abandoned here and in America, while in Germany it has taken the form and been reduced to the manufacture of sand-lime bricks, which are now produced there in very large numbers.

With regard to bricks, Mr. Ford has devised a far simpler and cheaper process, which he desires to see carried out in connection with the stone process.

As to durability, we cannot do better than quote Mr. Ford's own words:—"Most natural building stones are unable to stand chemical tests, and the consequence is they have had to gain characters respectively by use; but a silicate-of-lime stone will endure chemical tests. Secondly, a silicate-of-lime stone was made by Ransome in 1837, but by an expensive process, and the buildings constructed with it are monuments of durability. Thirdly, we must not forget that the strength of the still standing Roman structures is due to the presence of silicate-of-lime. Fourthly, on the Continent there are buildings constructed of silicate-of-lime stone made by processes which were a failure, not for quality, but on account of the great waste from cracks. And lastly, silicate-of-lime bricks are now fully accepted as durable in Germany, France and elsewhere."

The process lends itself to producing the stone in any degree of hardness, and in any colour. Some of the stone now being exhibited is certified by Messrs. Kirkaldy & Son to crush at 692.8 tons per square foot.

The stone being absolutely homogeneous, and produced without cracks, flaws, air-holes, &c., can be used and cut up in the manner dictated by the size required, and no other considerations.

Mr. Ford thinks that it is not desirable, in the interest of architects and art, to produce only set sizes and designs, but to make the stone in quantity and in large blocks, and sell at a very cheap rate.

Mr. Ford's discovery will be the means of developing many an estate and the numerous large patches of desert country in various parts of the earth, also utilising the waste tailings from gold and other mines, and affording a really lasting stone in our large cities, the impurities in which are so inimical to many of the natural stones.

Mr. Ford's first factory is in North Wales; but the flotation of companies for London, Birmingham, Manchester, &c., besides for Johannesburg, Australia, India and elsewhere abroad are already being discussed, so that ere long the industry will be in full swing.

The cost of manufacture is calculated to be under 3d. per cubic foot of stone, and about 12s. a thousand of bricks, in factories of a fairly large capacity. And the selling prices will range from 8d. to 1s. 6d. per foot of stone (according to quality) and from 25s. to 50s. per thousand for bricks.

Mr. Ford's syndicate of 43,000l is nearly filled up, and several applications for licenses at home and abroad have already been received.

An exhibition of large and small blocks of stone and some bricks is open at 73 Coleman Street, E.C., which it is well worth our readers' while to visit, as it will convince them of the truth of the statements and claims made.

Mr. Ford is a lawyer. He held the position of Her late Majesty's Attorney-General in the Transvaal in 1877. He was the founder and owner of Fordsburg and Jeppes Town (suburbs of Johannesburg), besides several other important undertakings, and he took up the solution of the difficulties of the manufacture of silicate-of-lime stone through having to take over a mortgage on a property which consists chiefly of large deposits of silica and limestone. To turn them to account Mr. Ford had a factory put up on the German system, which he, like others, found a failure; but, having once tackled the

VARIETIES.

CLOCK tower is about to be erected at Surbiton from designs of Mr J. Johnson, architect, of 9 Queen Victoria eet, London, E.C

MR. F. C. WHEELER, of 4 Frederick's Place, Old Jewry, don, has been elected an Associate of the Surveyors' titution.

THE opening ceremony was performed on Monday in con- ction with the new schools just erected in Grove Lane, ndsworth, for 1,600 scholars, at a cost of upwards of 14,000l., the Handsworth School Board.

THE Brighton Guardians have decided to spend 1,000l in proving the water service at the workhouse as a precaution inst fire. They have declined, however, to act on a sugges- on from the chief constable that a resident fireman should be ointed, the idea being that the present officials are suffi- ntly trained.

THE new Waterloo school, erected by the Oldham School ard, has been formally declared open by the Rev. Canon untree, chairman. The school is situated in Greengate eet, and the total cost, including furnishing, is about 16,000l. accommodates 906 children.

OUR contemporary, *Le Mois Scientifique et Industriel*, ounces the removal of its offices from the Boulevard des ignolles to 8 Rue Nouvelle, Paris IX. It will publish, in form of quarterly supplements, four exhaustive monographs, which the first will treat of the "Fabrication des Fontes, iers et Fers par le Haut fourneau électrique." It will appear the 25th inst., and will contain a number of sketches and wings. The second supplement will appear on June 25, d its subject will be "Les Applications industrielles du id."

THE new church of St. George, Abbey Hey, Gorton, has t been consecrated by the Bishop of Manchester (Dr. orhouse). The parish of St. George, which was formed in bruary 1899, has a population of about 4,000, and there is

every prospect of rapid development. The chancel, side chapel, vestries and three bays of the nave (with accommoda- tion for 400 people) are now complete. It is expected that the cost of the church will be about 4,400l.

AN important stage in the completion of the new church of Greyfriars, Aberdeen, has been reached in the formal opening of the hall in connection with the building. This spacious suite of rooms, which is situated beneath the church, is now finished, and it is expected that another three months will see the church proper ready for occupancy. The building, in- cluding the site, has cost 20,000l, and, in addition, the con- gregation are to spend 2,300l in the erection of an organ, stained-glass windows, an oak screen and other adornments.

AT Tuesday's meeting of Chirk District Council a scheme for the systematic drainage of the parish of Chirk was adopted. Mr. Bremner Smith, the engineer, explained that the three separate schemes would necessitate an expenditure of over 2,000l. The septic tank system would be used, and one acre of land near Maesgwyn farm would be required for Chirk, half an acre for Halton, and another half acre for barracks. The engineer's slight modifications, suggested to reduce the cost by 50l, were approved

THE Bombay Port Trust has prepared a scheme, subject to the approval of the Government, for the construction of a great new dock with a water area of nearly 50 acres, the site to be between Ballard Pier and the present docks, the depth to be 33½ feet, and the entrance to be through a lock 600 feet long. The dry dock will be from 800 feet to 850 feet long. The scheme includes a deep-water dockhead pier 1,250 feet long, where mail steamers will be able to moor, the passengers stepping from the ship to the train. The cost of carrying out the scheme, exclusive of the branch railway line necessary, is roughly estimated at three crores of rupees (3,000,000l. in Indian currency).

AFTER being entirely remodelled and the plant brought up to date for steel smelting and rolling, the Britannia Works of Messrs. Dorman, Long & Co., Middlesbrough, were re- opened on the 2nd inst. About 1,000 hands used to be employed in this part of the firm's extensive concern, where girder making and bridge building work is carried on, and during the six months the alterations have been going on the workmen have been engaged in other, if less remunerative, occupations. The new plant is according to the latest American and continental practice. It is proposed only to

keep in stock the standard sizes of girders, but the firm's other sizes will be rolled when required for any special work.

ELECTRIC NOTES.

THE electric light was, on Monday evening, switched on in Hornsey, just two years from the day the work was commenced. The scheme is that of Mr. C. E. Lovegrove, the District Council's engineer, and already 81,962*l.* has been expended upon it. A further scheme, involving the outlay of 17,000*l.*, has been sanctioned.

THE Stoke Newington Council wish to promote a Bill in Parliament enabling them to purchase electricity in bulk from Hackney and Islington for the lighting of certain streets which they are legally bound to illuminate in this way. As there was opposition a poll has been taken of the ratepayers and owners, and the result has been declared as follows:—For the Bill, 2,371; against, 2,117—majority in favour, 254.

THE electricity committee of the Worcester Corporation report a profit of 1,151*l.* on the year's working, after payment of all expenses, including interest and sinking fund. The water-power at Powick station has proved more remunerative than in any previous year, 58.6 of the current having been generated by water-power, causing a reduction in the coal bill of 57.2*l.* over the previous year.

MR. HENRY F. JOEL, A.M.I.C.E., of 31 Wilson Street, Finsbury Square, notifies us that he has purchased the lease, plant and stock of that branch from the firm of Henry F. Joel & Co. and Thos. Potter & Sons United, Ltd., and that he purposes carrying on the business of electric dynamo motor and electric motor car manufacturer and contractor at that address in his own name.

LABOURERS' DWELLINGS, LIVERPOOL.

THE following report was read at the last meeting of the housing committee of the Liverpool City Council:—

Pursuant to the following resolution of the housing committee of December 5, 1902—"That the piece of land in Eldon Street shown on the plan submitted be placed at the disposal of the City engineer, and that he be requested to prepare plans and estimate of cost for the erection of concrete cottages thereon"—the engineer submits herewith Drawing No. 3,296,

showing the proposed general arrangement in plan and elevation of a block of tenements suitable for erection upon this site and also estimates which he has prepared of the cost of the buildings, &c.

The site upon which the buildings will be erected contains 413 square yards, and this space is laid out as follows:—Buildings, 234 square yards; open space, 179 square yards.

The building consists of three floors, on each of which four tenements are arranged. Each tenement comprises a living room 15 feet by 10 feet 3 inches, and two bedrooms averaging 7 feet 4 inches by 14 feet 3 inches, the height of the room from the floor to the ceiling being 10 feet; the floors will be covered with $\frac{3}{4}$ -inch boards or other suitable material laid on the concrete. The arrangement of the bedrooms relative to the passages and conveniences is such that, if though desirable, pairs of tenements can be used as two three-roomed houses, or alternatively as one four-roomed house and one two-roomed house. A fireplace and chimney is shown in each room, and through ventilation and light is provided. A cupboard for food is provided in each living-room against an outer wall, which is perforated to admit of free ventilation. Each tenement has scullery, separate water and ash-shoot accommodation, these being arranged in a projection at the back, and, together with the drainage connections, are kept outside the main building.

Each tenement is provided with a separate entrance door from the balcony facing the street. The stairs and balconies are on the front elevation and open to full view from the street with the object of avoiding the evils of common stairs and passages within the buildings.

As the roof is practically flat (the slope being that usually allowed as crossfall for flagged footwalks), a stair has been provided to the roof, which, being surrounded by parapet wall and made waterproof, can be used for washhouses and drying ground, or, if desired, as a playground.

The materials to be used in the construction of foundations, walls, floors, roofs, &c., of these tenements will be crushed clinker from the refuse destructors and Portland cement, with a small proportion of embedded steel or iron. The crushed clinker and cement will be mixed in proper proportions at the destructor depôt, and filled into moulds to form slabs, each slab representing a complete side, floor, or roof of a room. The openings for doors, windows, &c., as well as the fireplaces and flues, will be formed in the slabs, and projections in the nature of dovetails with their corresponding notches on

ities are provided, so that each slab may be dovetailed to ch of the slabs with which it comes in contact when erected, e permanent jointing material being cement mortar. The lconies, stairs, balustrades and the chimneys, where they rise ove the roof, are similarly moulded in blocks.

The site of the buildings will be excavated where necessary, d the foundations composed of the same materials filled in u, brought up to a level surface at the ground level, and owed to set.

The drainage, water and gas connections from the street e also put in and brought up to the ground level adjoining, under the site of each w.c. or scullery.

When the various slabs and blocks have matured they are ted, placed on waggons behind a traction engine and removed the site of the proposed building. They are here lifted from e waggons by an overhead travelling crane, and deposited in eir final position in the building.

When the building has been erected the windows, doors, ates and fittings are fixed in position and completed as usual

The engineer's estimate of the cost of the scheme is as llows:—

Land.

3 square yards at 12s. per square yard £247 16 0
ost of buildings complete, including drainage
and finishing open spaces 1,230 0 0

Capital expenditure 1,477 16 0
tenements (each consisting of three rooms) at
4s. per week, making a gross rental per annum
of 124 16 0
ess allowances for outgoings, say 40 per cent. 49 18 4

£74 17 8

r equal to a 5 per cent. return on the capital expenditure.

In submitting the above estimates for the cost of this ilding the engineer has had difficulty in settling the prices, any portions of the work being novel, but he has allowed at he considers a reasonable margin for contingencies and r possible alterations to existing plant.

The committee will understand that in the case of the first ck it will be necessary to execute most of the work by hand our, but if the experiment warrants the erection of further cks on this system the additional economies obtainable from nveying and mixing the materials in the first instance and

the subsequent handling of the slabs by mechanical arrange- ments would enable the actual cost to be materially reduced.

JOHN A. BRODIE, M.Inst.C.E.,
City Engineer.

Municipal Buildings, Liverpool:
February 27, 1903.

DELTA METAL.

THE fifteenth annual general meeting of the shareholders of the Delta Metal Co., Ltd, was held at Cannon Street Hotel on Friday, February 27. Mr G. A. Dick, the chairman of the company, in moving the adoption of the report, referred to the continued growth of the demand for the company's high-class engineering alloys, especially for the Delta Metals Nos. I. and IV. These alloys have a very high and well-deserved reputation on account of their strength (exceeding 48 tons tensile per square inch for Delta Metal No. I.), and their resistance to corrosion, and new applications are continually found for which the special qualities of these alloys render them eminently suitable. The standard of the tests of engineering alloys has lately been raised considerably, not only by the Government, but also by many of the large engineering firms. This is a matter which is hailed with great satisfaction by the company, as it has largely increased the adoption of their superior manufactures. Being in close touch with the works on the Continent and in the United States, where the manufacture of Delta alloys is also carried on on a very large scale, the company has, by reciprocal agreements, the advantage of all improvements made at those works. These various factors have helped to bring about an increased output, a continuance of which may be considered as assured, the more so as the company's business, consisting chiefly of specialties, is not much subject to the usual fluctuations of trade. The somewhat unsettled condition of the metal market towards the close of the year has been duly taken into consideration, and the stock has again been valued at lower figures. The plant at both the London and Birmingham works of the company has been maintained in a thoroughly efficient condition. Although additions have been made to it, it now stands at a lower figure than last year, due to the fact that the depreciation has been written off at the usual full rate. Out of the profits for 1902 it is proposed to pay a dividend at the

same rate as last year, namely, 12½ per cent. per annum (less income-tax), and to make an addition to the reserve fund which brings the latter up to 10,000. In conclusion, Mr. Dick expressed his gratification at the conscientious and careful work of the officers and staff, to which he attributed to a great extent the success of the company. The report and accounts were unanimously approved and adopted, the dividend as recommended was declared, and the retiring director, Mr. J. W. Meyjes, as well as the auditors, Messrs. Geo. Williams & Co, were unanimously re-elected.

THE NEW JOHANNESBURG.

IN the *Rand Daily Mail* is an account of an interview with the municipal inspector of buildings (Mr. E. H. Waugh) in Johannesburg.

The extension of the municipal area from a three-mile to a six-mile radius has doubled the work of the building branch of the engineer's department, and the staff has been correspondingly increased, Mr. Waugh now having five assistant inspectors. The number of buildings in the new area is not great in proportion to the extent of the addition.

"Is Johannesburg overcrowded?" the inspector was asked.

"I should say it is pretty full, but not overcrowded," he replied. "There is unquestionably a great demand for dwelling-houses, but this demand is being met by the large number of houses being built.

"The building trade generally is not, builders complain, very brisk at present in Johannesburg—owing to the unsatisfactory state of the money market I suppose—but it is worth recording that no less than 95 per cent. of the plans sent in are for dwelling-houses. Very few offices, and not many warehouses, are going up. You can calculate the number of houses in course of erection when I tell you that in January we passed 167 plans."

The public will be pleased to learn that a better class of house is being built in Johannesburg.

"It is gratifying to note," said the inspector, "that a larger proportion of the new buildings are of brick—good, solid houses—instead of, as formerly, wood and iron."

"What is the cause of the change?"

"For one thing," he replied, "the municipal by-laws specify a good many streets—we call them business streets—in the centre of the town where all the buildings must be of brick or

stone. The number of these streets is to be greatly increased under the new by-laws, and no objection has been offered to the extension of this restriction. Then there is a good deal of competition in the brickmaking business, with the result that the price has come down, until now there is little difference in the cost of the two kinds of houses. Besides, difficulty and delay are often experienced in getting up supplies of wood and iron."

The Rand cannot boast many buildings of much magnificence. But this reproach—if reproach it can be counted against a town still in its 'teens—is gradually being removed. Some very big buildings are about to be erected. The inspector had something to say about these.

"This will be a very fine street," he said, pointing to plans of the new National Bank and Eckstein's Buildings. They certainly looked imposing.

"Both buildings," he went on, "are 120 feet high, and will run from Commissioner Street to Market Street, 'tween Chains. Stuttaford's new shops will also be 120 feet. Eckstein's and Stuttaford's structures are both being erected by Milliken Brothers, of New York, on the steel construction, or 'bird-cage' principle."

Asked how these piles compared with Jagger's Cape Town "skyscraper," of which so much has been heard, the inspector said that all the buildings he had named would be higher than the Cape Town block.

Johannesburg Town Council propose to fix the maximum height for buildings at 140 feet. No objection has been raised by any local body concerned. The inspector considers this rule very generous, and says it would not be safe to have higher buildings owing to the impossibility of coping with fire at such a height.

The theatre is undoubtedly a favourite resort on the Rand, but it is questionable if all the theatrical enterprises on the tapis can succeed. No fewer than three new theatres, all capable of accommodating considerably over 1,000 people, are about to be built—in Fox Street, Eloff Street and De Villiers Street. The plans have been submitted to the Council, and the new theatres will certainly be a big improvement on the existing ones, which can scarcely be said to be a credit to a town of the importance of Johannesburg.

Another huge building is the Carlton Hotel, which will be by far the largest and most sumptuous hostel in South Africa. It covers six stands, has two basements, and seven storeys and an attic, and will have a garden on the roof. A novelty is the

struction of double corridors—one public and the other
ate, so that suites of rooms can be curtained off and made
tly private. In this building the steel "bird-cage" framing
be erected by the General Steel Construction Company of
York.

The establishment being erected by the African City
erty Trust in Eloff Street is worthy of mention. It con-
s a large number of suites of rooms, each consisting of
ng-room, bedroom and bath-room, and already, it is stated,
promoters of the scheme have many applications for
ommodation.

Referring to the fact that all the contracts for the big steel
dings had been secured by Americans, the inspector said :—
ough so far the structural work of all the big buildings to
erected on the skeleton principle has been captured by
ted States firms, 'loyal sons of the Empire' will be glad to
n that the home manufacturers are at last becoming alive
he value of this new form of construction, and Mr Dorman,
Dorman, Long & Co., the famous Middlesborough firm of
l rollers, has lately returned to England after a visit to the
ad, and has also sent his engineers to America to examine
latest developments at Carnegie's and other large works,
a result that this company intend to revise the whole of
r catalogue and enter into the structural steel market, with
pecial view to catering for South African requirements on
most modern principles. They also mean to enter into
tracts for the erection of buildings of this kind, and archi-
s and others in town consider that they will be able to
pete with their American cousins very favourably as
ards price; and as to workmanship, theirs is of such a
racter that without doubt they will capture the local market
very great extent."

"Which of the new townships are developing most in the
ended municipal area?"

"The new townships that are going forward most," said the
pector, "are Bezuidenhout Valley in the extended area, and
ville, near Auckland Park. Large numbers of houses are
ng up there. Ecksteins have a very liberal scheme for
dding houses for their employées. All the houses are brick
stone, of nice design, and comfortable. In Denver town-
p, beyond Jeppes, a few stores and houses are being built.
ere are also a few houses going up on the Heronmere estate
at Turffontein, although the extension in that direction is
great, nor likely to be for some time. Several warehouses
to be erected in the city and suburbs."

Regarding the opening up of townships, the inspector ex-
plained that as soon as the tram service was extended to the
suburbs there would be an inevitable exodus from the dusty
city, but since the Council's tramway scheme did not embrace
any of the outside places, developments of this nature would be
slow.

The adage tells us, however, that all things come to those
who know how to wait, and some of our enterprising township
companies know how to wait, and how to do it quickly, too.
So that ere the Golden City is very many months older we may
see the sparky cars sliding through the heart of the principal
suburbs, sprinkling seeds of progress all along their route.

So mote it be.

HOSPITAL SITES IN LONDON.

A MEETING of the Hospitals Association was held at Caxton
Hall, Westminster, on Tuesday, when Sir Henry Burdett
opened a discussion on "Hospital Sites and Population in
London," which dealt with the question as to whether any, and
if so which, of the large hospitals should be moved from their
present sites to new ones situate in more congested districts or
in the country. Sir Henry Burdett dealt with the various dis-
tricts of London, and, referring to St. Bartholomew's Hospital,
said that it was the only general hospital situated within the
City boundaries, and he could not conceive of the City of
London ever consenting to permit so representative an institu-
tion to be removed from its present site to any site except one
which was closely adjacent to, or only just outside, the City
boundaries. The proposal to remove large hospitals from
cities to the country seemed to him to be impracticable. He
pointed out that, with the exception of the south-west district
—Wandsworth and Battersea—where the ratio of general beds
to population was only as 1 to every 13,364 people, and the south-
east district, including Deptford, where there was not a single
hospital bed for upwards of 110,000 people, Greenwich, Lewisham
and Woolwich, a district where the ratio of general beds to popula-
tion was as 1 to 2,126 people, the population within the whole of
the postal districts of London was well supplied with general
hospital beds. Indeed, if they added to these beds the beds
in special hospitals, then every district, with the two exceptions
just mentioned, showed that the ratio of all hospital beds to
population is greater than that laid down by the accepted
authorities as a basis for calculation, namely, one hospital bed

for every 1,000 people in a given district. If, therefore, King's College Hospital moved to a site situated conveniently for the population of Deptford and Camberwell; the North-West London Hospital united its forces with the Miller Hospital, and erected modern buildings on a site convenient for the residents of Greenwich, Lewisham and Woolwich; and the Westminster Hospital, or possibly St. George's Hospital, if the governors of the latter institution were determined to move and Westminster Hospital found it could not secure sufficient funds to enable it to take this step, the question of hospital sites and population in London would be placed upon a basis adequate to supply efficiently all the needs of the residents within the county of London. A discussion followed.

BUILDING ACTS AMENDMENT.

THE parliamentary committee of the London County Council prepared the following report, which was brought up at the meeting on Tuesday:—

We have given our most careful consideration to the course to be adopted with regard to this Bill, which has now been read a first time in the House of Commons. Instructions to us to promote the Bill were given by the Council on November 4 last, and time did not permit of our ascertaining the views of the various authorities and bodies concerned before submitting the Bill to the Council for approval. We have not at the present moment been furnished with the views of some of the more important technical bodies, but, from such observations as we have received, and from information which has reached us from various quarters, we regret that we are driven to conclude that the Bill will, if proceeded with in Parliament, encounter very considerable opposition. We are advised that many of the suggestions which have been received would form bases for useful amendments of the Bill in detail, and that had time permitted the Bill might with advantage have been in some particulars differently drafted. It is with great regret that we arrive at the conclusions embodied in the recommendation which we submit concerning a measure for the protection of human life and property from the perils of fire, and in doing so we are influenced by the knowledge that the Council will, with more time at its disposal, be in a position, if it adopts our recommendations, to place before Parliament in the session of 1904 a more complete and perfect measure.

It is important that any step in the direction of withdrawing the Bill should be taken without delay, in order that such authorities and bodies as may wish to take action with regard to the Bill may not be put to any unnecessary expense and trouble. We accordingly recommend:—(a) That, notwithstanding any previous resolution of the Council, a Bill to amend the London Building Acts be promoted in the next session of Parliament, instead of in the present session; and that the London Building Acts (Amendment) Bill, 1903, be not further proceeded with. (b) That the Bill, as at present drafted, be referred to the Building Act and parliamentary committees, with a view to their advising the Council, after consultation with such persons and authorities as may be desirable, as to the ultimate form the Bill should assume.

Mr. Napier moved the adoption of the recommendations. The committee took this course from no want of sympathy with the objects of the Bill. He doubted whether the committee had had due time to consider the very important matters involved in the Bill, which affected very many interests, houses and factories in the City of London, and would necessitate the expenditure of a large sum of money. The present Bill would have little chance of succeeding, but he believed with their increased experience and additional expert advice they might next session present a Bill which would avoid many of the difficulties of the present one.

Mr. Radford (the chairman of the parliamentary committee) moved that the recommendation should be referred back to the committee with instructions to proceed with the Bill in the present session. He declared that the Bill had been well considered and had been approved by the Council with practical unanimity. He could, therefore, see no reason why it should be withdrawn.

Mr. Taylor seconded the amendment, and said that there were in London hundreds, if not thousands, of buildings which would be nothing less than death-traps in case of fire.

Mr. Howell Williams said that the architectural profession and the building trade opposed the Bill, because they objected to being left entirely in the hands of the Building Act committee.

Mr. Alderman Alliston said the owners of buildings in the City were as anxious as anybody to protect life from fire, but this Bill went far beyond anything which was required and inflicted great injustice.

Mr. Allen (chairman of the fire brigade committee) said

at although his committee did not agree with all the provisions, they thought the Council would be well advised to go on with the Bill
The recommendation to withdraw the Bill was adopted.

THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, February 24, Mr. C. Hawkshaw, M.A., president, in the chair, the paper read was "Mechanical Handling of Material," by G. F. Zimmer, Assoc. M. Inst. C.E.

Mechanical appliances for the conveyance of material from one point to another were undoubtedly of the first importance owing to the economy which they effected; and in round figures the saving of one man's wages warranted an outlay of £1000 in machinery. The paper treated only of such methods as dealt with material continuously—that was, which received and delivered it in an uninterrupted stream, and passed over such methods as light railways, ropeways, &c. The appliances were described under three heads, viz. :—

(a) Appliances for lifting in a vertical direction or from one level to another called elevators.

(b) Appliances for moving material in a horizontal direction called conveyors.

(c) Appliances which combined the two former operations.

Elevators in a primitive form had been known and used for a considerable time, and since their introduction had undergone little alteration except in details. They consisted of endless belts or chains, to which suitably shaped buckets were attached, and which ran over two terminal pulleys, fixed at different levels. Grain-elevators were usually vertical, and were encased in wooden and iron trunks; while mineral-elevators were generally in a slanting position at an angle of 45 degrees to 60 degrees. Grain-elevators were fitted with leather or textile bands, while mineral-elevators had malleable or wrought-iron chains as support for the buckets. Grain-elevators, travelling at a speed of 250 feet to 350 feet per minute, according to the size of their terminal pulleys, could deliver satisfactorily if in a vertical position; while mineral-elevators, which travelled at the rate of only 50 feet to 160 feet per minute, required the inclined position, so as to discharge their load clear of their own buckets. Inclined elevators were more easily driven than vertical elevators, on the principle of

the inclined plane. In vertical elevators, in order to effect perfect discharge, the centrifugal force must be sufficient to overcome the gravity of the material; so for a specifically heavy material it was necessary to have a higher centrifugal force, that was, greater speed of elevator, than for a specifically lighter material. While it was usual to run coal-elevators at 90 feet to 130 feet per minute, according to the friability of the coal, coke-elevators ran at only 50 feet to 90 feet per minute. On the other hand, minerals which did not deteriorate through breakage could be elevated at the rate of 120 feet to 160 feet per minute. A very rational form of elevator was that fitted with a continuous chain of buckets. It was of much larger capacity than an ordinary elevator of the same dimensions. It received and delivered the feed more uniformly, and as the buckets need not plough intermittently through the contents of the elevator-well, slightly less driving-power was required.

The types of conveyor were numerous and some of them were of great antiquity. The oldest type was undoubtedly the Archimedeian screw, worm or spiral conveyor. It consisted of a continuous or broken blade screw described round a spindle, revolving in a suitable trough and thus propelling the material slowly from one end of the trough to the other. The ratio of the diameter to the pitch of all worms depended upon the kind of material to be conveyed. It ranged from a pitch of one-third of the diameter to a pitch equal to the whole diameter of the worm and even more. The greater the pitch the greater the driving-power required. A detail of great importance in all worm conveyors was the intermediate bearing. This, if cumbersome, obstructed the passage of the material, a result which was to be carefully avoided. Delivery of the material from a worm conveyor could be effected at a number of points; it was only necessary to provide a suitable outlet. The principal advantages of the worm conveyor were its simplicity and small first cost; it was, moreover, of great service where a mixing of the material to be conveyed was desired. The chief disadvantage was the large amount of driving-power required and the breakage of the material conveyed.

Conveyors of the drag or push-plate type consisted of a fixed open trough. The material to be conveyed was deposited in this trough, and was pushed or dragged along by a series of plates attached to an endless chain. The speed of travel ranged from 60 feet to 180 feet per minute. The cable conveyor consisted of a V or U-shaped trough through which was dragged a wire rope with disc-like attachments. The speed of travel was 100 feet to 120 feet per minute.

NORMAN & STACEY, Ltd. DESIGNERS and DECORATORS.
252, 253, 254, 255 & 256 TOTTENHAM COURT ROAD, W. (Oxford Street End).

Band conveyors had been introduced a little more than twenty years ago, and were now one of the best means of conveying large quantities of almost all kinds of material, especially for long distances. They consisted of a band which ran over two terminal pulleys. Early band conveyors had been almost entirely used for conveying grain. The tightening of a band conveyor was done in a similar manner to the tightening of elevators. In long conveyors the tightening-gear consisted of a pulley held in tension by weights over which the belt passed. The tight side of the band was the one which should preferably be used for conveying the material. To withdraw the feed of a band conveyor at an intermediate point, a throw-off carriage was employed. The speed at which band conveyors for grain were run varied from 450 feet to 600 feet per minute. The lower speed was for oats or other grain which contained a quantity of chaff that would be blown off the band at a speed exceeding 500 feet. Maize, beans and heavier seeds were conveyed at the highest speed of 600 feet per minute. Band conveyors for heavy materials, such as coal, coke, minerals, &c., were very similar to those previously described, with the exception that all the fittings were much more substantial. The principal advantages of band conveyors were the small amount of power required to drive them, and the fact that they did not injure the material conveyed. The disadvantages were that a great many small bearings had to be oiled and kept in repair.

The continuous-trough or travelling-trough conveyor consisted of an endless trough, the sections of which were rivetted to the links of suitable chains. The endless trough travelled over two terminal pulleys. These conveyors travelled at 75 feet to 100 feet per minute. They were in their construction very similar to the push-plate conveyor, but each section of trough took the place of a push-plate on the endless chain.

The vibrating-trough conveyor was the latest type, and consisted of troughs which received the material at one end and delivered it to the other by means of a succession of suitable backward and forward movements of the troughs. These might therefore be classed together with the two previous types, the band and the travelling-trough conveyors, as in all three the material was, so to speak, conveyed in a trough without the action of a stirring or pushing element, as was the case with worms, push-plates and cable conveyors. It was obvious that all kinds of materials which deteriorated

through rough treatment should be conveyed on appliances of the last three types. The support of the trough in its reciprocating motion had been effected by flexible legs in an oblique position. For considerable lengths and capacities the conveyors were balanced. The load could be fed into or withdrawn from any of these conveyors at any number of points without cessation of work. The material travelled at the rate of 40 feet to 70 feet per minute.

Under the heading (c) there were only two types to be mentioned—the travelling or tilting-bucket conveyor and the pneumatic conveyor. The former consisted of two endless chains or ropes held at certain distances apart by suitable bars which were fitted with small rollers at each end. Every link, and sometimes every second link, carried a bucket, so that the whole was an endless chain of buckets, which were not, however, fixed like an elevator bucket, but were movable, and suspended above their centre of gravity, so that they were always in an upright position, whether they were moving horizontally or vertically. Each bucket carried its load to the point at which delivery was required, and here it was met by an adjustable device which tilted each bucket in its turn, and thus emptied the contents. The material to be conveyed was not injured in the least. Such conveyors required little driving-power, and one main drive was sufficient for a whole installation. The second and last appliance under this head was the pneumatic elevator. Mr. F. E. Duckham, M.Inst.C.E., had designed the apparatus which had been in use at the Millwall Docks and in docks of other ports since 1895. The plant consisted of an air-tight tank from which a pipe was connected to the bulk of material to be conveyed. The air was withdrawn from this tank by means of a second pipe connected to an exhauster, and as the air passed through the first-named pipe it drew the grain with it into the tank. The arrangement for removing the grain from the tank without destroying the vacuum was described and illustrated. The Bolinder timber-conveyor was also described.

Provision was made in many modern power-stations, gas-works and mines for automatic handling of the materials, and there was no reason why labour-saving appliances should not be employed in dock works, &c., for the handling of the excavated material.

The paper was illustrated by diagrams and accompanied by numerous tables of data as to the capacity of elevators and conveyors of different sizes and speeds and the amount of power required for working them.

CABOT'S INSULATING & DEAFENING QUILT

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Deca-moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

The Architect.

THE WEEK.

It is commonly assumed that town surveyors and borough engineers have a wish to monopolise every form of construction. There is no doubt that in some cases at least that is a fallacy. With a large town like Brighton there is a probability of a breakdown of the official, as he is unable to sustain all the work placed on his shoulders. In Brighton a new fire station is desirable, and at the last meeting of the Town Council it was proposed that the surveyor should confer with the chief constable and prepare plans for the erection of a fire station, &c., with an estimate of the cost, and submit them to the committee at an early date. One of the members decried the suggestion, for he said that not only were they unfairly treating Mr. MAY, the surveyor, in asking him to do so much work, but it was utterly impossible for him to perform it. Another member recalled the fact that the Corporation had formerly suffered because the engineer had been unable to carry out all the work efficiently which had been thrust upon him. It was also considered that Brighton would be the gainer if plans were obtained by competition. Eventually the resolution was withdrawn, which means that all the labour of the committee in inquiries has been in vain. It is of course possible that an amended resolution may be shortly brought forward, but it is generally found that in similar cases when an opportunity is lost it is not quickly found again.

THE official *Livre foncier de Paris*, which was issued this week, supplies a large amount of statistical information about the value of the houses of Paris. In 1901 there existed in the city 80,319 properties consisting of houses or manufactories which occupied an area of 39,983,357 square metres. The capital value was 13,813,113,490 francs, and the rental value 878,678,271 francs. Recently account has been taken of unoccupied land within the boundaries of the city, which is found to have an area of 1,592,972 square metres, the valuation of which is 10,064,850 francs. The buildings have been classified in twenty-one groups, according to their value. It will be sufficient to say that 30,025 do not exceed 49,999 francs in capital value, that 304 vary from 2,000,000 to 4,999,999 francs, and that only fifty-seven properties exceed five million francs. On the other hand, there are 10,430 properties of which the capital value is less than 10,000 francs. It is also found that 28,450 buildings have five or more storeys, 18,240 have four storeys, 17,502 have three storeys. If tested by valuation, the Eighth Arrondissement is the most important in Paris. It extends from the Madeleine to the Arc de Triomphe, and from the Parc Monceaux to the Seine. Within that district are 3,158 properties of the value of 1,854,907,000 francs. The poorest is the Twentieth Arrondissement, which extends from Père la Chaise eastwards. It contains 6,175 properties of the value of 145,248,650 francs. The rural quarter of Saint Fargean is comprised in it, where the average value of the houses is only 31,408 francs; while in the Chaussée d'Antin quarter the average is 660,635 francs. The municipal tax is 10 per cent. on the capital value.

A STRANGER who could enjoy a bird's-eye view of the vast collection of houses known as Brighton and Hove would take it for granted that what he saw formed an immense town or city by the sea. He would be surprised to learn there are two distinct towns, and that there is as much emulation between them as if they were some miles apart. So long as the rivalry does not mean waste of money on useless works, or on law costs, the inhabitants have no reason to complain. The Aldrington sewage case, which was decided in the Court of Appeal on Friday last, is, however, enough to suggest the possibilities of waste over works and law. The action has been for nearly a year before the Courts, and we have already related the circumstances. In 1870 an Act was passed, known as the Brighton Intercepting and Outfall Sewers Act, by which Hove was allowed to use the sewers equally with Brighton. In 1893

the district of Aldrington was incorporated with Hove. The Brighton Corporation, while admitting, of course, the rights of Hove, considered that Aldrington was not included in the agreement, and that, indeed, the sewers were inadequate to an increased discharge. Mr. Justice KEKEWICH gave judgment in favour of Brighton. The Hove Town Council resolved to appeal, and the arguments on both sides occupied three days. The Court were unanimously of opinion that the decision of the Court below should be set aside, and the appeal allowed with costs against Brighton. The Master of the Rolls said that an enlarged district was contemplated from the first, and that Aldrington was as properly and as completely added to Hove for the purpose as if it had been expressly named in the Act of Parliament. Lord Justice ROMER held that sooner or later, and even if Aldrington were not incorporated, the intercepting sewer would have to be enlarged. Meanwhile, the Brighton Town Council were not justified in refusing to Hove and Aldrington the right to have its drainage taken by the sewer. His Lordship said there was a question about the authority to enlarge the sewers, but if necessary they could apply for it to Parliament. The cost of the sewers was obtained by raising a loan for fifty years, and repayment has been in progress for thirty years. The new district will have to pay its proportion of current expenses, including the capital and interest for the repayment of the loan.

AMONG the graves in Hampton churchyard is one of HUNTINGTON SHAW, of Nottingham, "an artist in his own way," who died in 1710. To him the fine iron screen and gates at Hampton Court were long attributed. But there seems to be no doubt they were designed by JEAN TIJOU, the Frenchman, and SHAW was only one of his assistants. As the effect of time on the ironwork was becoming too manifest, some years ago they were removed from the grounds to the interior of the palace, and subsequently parts were deposited in the South Kensington Museum and elsewhere. It is now contemplated to restore the screen, and to set it up again in its former position at Hampton Court. The whole of the work does not appear to exist, and accordingly Messrs. HART, SON & PEARD obtained a commission to make a replica of a pair of the gates. The commission has been carried out at their Birmingham works. The gates are 30 feet wide by 30 feet high. The only difference from the earlier examples is that the monogram of HIS MAJESTY THE KING has been substituted for that of WILLIAM and MARY. The execution of such elaborate ironwork justifies the trust placed in Messrs. HART, SON & PEARD. The new gates are enough to convince any lover of metalwork that English smiths under English superintendence are equal in dexterity to the Frenchman and Englishmen who produced the original gates at the close of the seventeenth century.

THE annual report of the London Master Builders' Association may be considered as satisfactory. It is admitted there was an appreciable decline in the bulk of trade during the year, but not sufficient to warrant the agitation on behalf of the "unemployed." There were no strikes on the works of any of the members. Any differences which arose were settled in almost every instance by the Conciliation Boards. The proposed amendments of the London Building Act were declared to be prejudicial to the building trade, oppressive to both owners of property and their tenants, besides arming the officials appointed by the London County Council with extensive powers for requiring structural and expensive alterations in existing premises. Regret was expressed that Parliament had not intervened to restrict building operations of municipal bodies. It was anticipated that in the near future a form of contract will be agreed upon by the Royal Institute of British Architects and the Institute of Builders, and that the objectionable practice on the part of some public bodies and individual architects who require priced bills of quantities with tenders will be abolished. The following officers were elected:—President, Mr. ERNEST J. BROWN; senior vice-president, Mr. JAMES CARMICHAEL; junior vice-president, Mr. FREDERICK HIGGS; treasurer, Mr. JOHN GREENWOOD.

TYPES OF COSTUME: EGYPTIAN AND ASIATIC.

MASTERS OF ART: SCULPTORS.*

PAINTERS, sculptors and poets have the advantage of being able to exercise their art in representing its history. That privilege is denied to architects and musicians. It would be easy for an architect to create a building which would embody variations of styles. But it would be impossible by means of a building to recall the personality of even the foremost architects. Musical composers or tone poets would labour under similar limitations if they attempted to record the history of music. Although it is the most expressive of the arts, music cannot give the least indication of those, from PAN to WAGNER, who brought it to its present state.

It must, therefore, have given more gratification to JOHN BIRNIE PHILIP when he modelled his series of figures of great sculptors than when the history of architecture was his subject. It will be observed by comparing the plate we now publish with that in *The Architect* of January 2 how much there is in common between the two works. Space and time are in metaphysics closely related, and each long slab of the podium corresponds with the course of many years. If distinction of genius conferred the right to the central position among the sculptors selected, PHIDIAS should occupy it instead of MICHEL ANGELO, and ARNOLFO was still less entitled to a similar status among architects. But if we consider that time and not genius is the ruling power, that the relief is like an historical scroll or summary, then it is fitting that PHIDIAS should be close to one end, and that MICHEL ANGELO, as the representative of Renaissance art, should come midway between antiquity and modernity.

It was possible in the architectural series to start with HIRAM. But numerous as are the records among Assyrians and Egyptians, they have not as yet yielded the names of any great artists who would serve to commence a long line of sculptors. The Egyptian and the Assyrian seen discussing in a friendly way some point of art, or it may be the influence they exerted on Greek and later sculpture, must be accepted as types of many nameless artists. It would be appropriate in such a work as the podium to introduce a large number of other figures in the arts of all countries who produced grand works, but whose names must for ever remain unknown. If the Athenians, as became a people who were hospitable to gods, raised an altar to the Unknown, a similar recognition should be bestowed on the anonymities who were in all ages the benefactors of humanity without receiving any acknowledgment of their services.

Who was the first Greek sculptor? The Greeks themselves assigned the position to DÆDALUS. If the results of the Cretan explorations could have been anticipated in 1865 he would no doubt have figured among the sculptors on the podium. But he was then considered along with the contemporary SMILIS and EPEUS, the designer of the wooden horse which appalled the Trojans, as being only a fabulous individual. RHÆCUS has therefore the honour of appearing at the head of the European sculptors. He belonged to the Isle of Samos. PAUSANIAS described him as the earliest founder, and PLINY credited him

with introducing the art of modelling. In Ephesus there was the figure of a woman by him called *Night*. He was also an architect, and HERODOTUS says that in Samos was "a temple greater than all those I ever saw, and of which the principal architect was RHÆCUS, the son of PHILEAS, a native of Samos." The name of DIBUTADES is connected with one of the most poetic romances of art. A daughter wishing to have a memorial of her absent lover outlined the shadow of his face upon a wall. DIBUTADES covered the face with clay, and in that way produced the first portrait in relief. As he was a potter the clay was easily converted into terra-cotta. It was believed that the relic was carefully preserved in the Nymphæum at Corinth until the city was captured by MUMMIUS. BUPALUS and ATHENIS were sons of an artist called ARCHEMOS or ANTERMOS, and it was supposed there was a public inscription recording that Chios was made as illustrious by their talents as by its own puissance. There was a statue of DIANA by the brothers, said to appear sad to those entering the temple and gay to those leaving it. FALCONET did not regard the feat as impossible, and endeavoured to explain how it could be repeated. The next figure is PHIDIAS, whose name now stands as significant of the utmost attainment in sculpture. His *Minerva* and *Jupiter* were from their beauty stated to have added something to religion. FLAXMAN held that the sculptor owed much to PLATO, both for the choice of subjects and the expression of qualities for the perfection of beauty. With all his genius PHIDIAS was compelled to suffer through the suspicious temperament of the Athenians, and it is not impossible that he ended his days in a prison.

According to PLINY, SCOPAS was employed on the Mausoleum as well as on thirty-six of the sculptured columns of the Temple of Diana at Ephesus. It is therefore concluded he was the contemporary of PRAXITELES, BRYAXIS and LEOCHARES, who are near him in the relief. PLINY considers the *Venus* of SCOPAS was superior to one by PRAXITELES, and mentions a large number of his works possessed by Rome. It has been supposed that the *Niobe* group was among his productions. He, too, practised as an architect, and in a Temple of Minerva he utilised the three Orders. BRYAXIS and LEOCHARES were both among the sculptors engaged on the Mausoleum. Some of the works by the former were so excellent as to be ascribed to PHIDIAS. VITRUVIUS describes LEOCHARES as one of the most distinguished artists, and mentions a colossal *Mars* at Halicarnassus as *nobili manu Leocharis factam*. We must not be surprised at seeing PRAXITELES in the second plane in the relief. It was difficult to identify any existing work as coming from his hand. WINCKELMANN asserted there was only one which had survived, the *Apollo Sauroctonus*, or lizard-killer, in the Villa Albani. The beautiful *Hermes* since found at Olympia reveals that all which was said of the sculptor by ancient writers was deserved. LYSIPPUS, the favourite sculptor of ALEXANDER THE GREAT, was, according to PLINY, the most prolific of all. The number of his works was reported to be fifteen hundred, and that each one of them was sufficient to give a reputation. They were nearly all in bronze, and although modelling in clay was more

* See Illustration.

expeditious than working in marble, probably there were not more than one hundred and fifty examples. CHARIS was the pupil of LYSIPPUS, and as the *Colossus of Rhodes* is ascribed to his hand it should have been introduced closer to him.

The dark interim between the flourishing period of Greek art and the beginning of the Renaissance is represented by the figure of GIULIANO DE RAVENNA. There were several artists employed by the emperors in Rome of whose names there are records, but for long after the establishment of Christianity the history of sculpture seems to be a blank. Not till the thirteenth century did NICCOLO PISANO appear. In the churches of France, Germany and England there was sculpture, but from its unworldly character it would now be considered as failing to uphold the Classic traditions. With NICCOLO, who in the relief seems to be looking sadly back to the past, we find a return to Classic models. Indeed, there is little doubt that both NICCOLO and his son GIOVANNI adapted examples of ancient sculpture to Christian usage. Ghiberti belongs to the fifteenth century, and is introduced as showing the trial piece of his gate to LUCA DELLA ROBBIA, whose work was not in bronze but mainly in enamelled terra-cotta. TOREL, the sculptor of the tomb of HENRY III. and Queen ELEANOR in Westminster Abbey, used to be generally regarded as an Italian artist, but he was a London goldsmith and a citizen. He is talking with WILLIAM of Ireland, one of the Mediæval artists who, like ALEXANDER of Abingdon, are mentioned in the records of English church building.

VERROCHIO was a pupil of DONATELLO, who stands before him, and laboured as a goldsmith and a painter as well as a sculptor. Either to him or LEOPARDI we owe the statue of *Colleone* at Venice. DONATELLO is seen bearing his statue *St. George*, which has been accepted as suggesting an ideal Christian warrior, but the artist himself seems to have preferred his figure of *St. Mark*. Greater than either is his *Gatamelata* in Padua. MICHEL ANGELO is sitting between his *Night* and *Day*, the figures adorning the tomb of GIULIANO DE MEDICIS, and holds one of his anatomical studies. Enmities are we may hope at an end in Elysium, and it is therefore allowable to suppose that TORREGIANO, to whom he owed the disfigurement of his face, could touch his knee in friendly fashion. JOHN BOLOGNA, who leans on TORREGIANO, was a native of Douai. He had received advice from MICHEL ANGELO, who told him always to reflect and reason about his work before he attempted to finish it. His *Flying Mercury* at least is a masterpiece. For most of the portraits of the Renaissance period reliance has to be placed on VASARI's woodcuts. PETER VISCHER appears to have anticipated the needs of the future, for he took the precaution of introducing his own figure with his leather apron and his tools in his hand among those adorning the shrine of St. SEBALDUS in Nuremberg. It was well he was able to use the occasion, for, according to tradition, he was treated shabbily, and would have received little reward if it were not for the voluntary contributions of some good people. BACCIO BANDINELLI's position in the rear is a merited punishment for his morbid jealousy.

BENVENUTO CELLINI, like VISCHER, was anxious to be known to posterity, for he set an example, which some modern English painters have imitated, in writing an autobiography. His *Théséus* shows his skill in treating the figure on a large scale, but in the sixteenth century he was esteemed for his works in the precious metals. His discourse is listened to by BACCIO D'AGNOLO, who was more of an architect than a sculptor. JEAN GOUJON was the first among the great French sculptors, but about his life little is known. His fountain, figures on the Hôtel Carnavalet, and caryatides in the Louvre, demonstrate his powers. BERNARD DE PALISSY was an able man of science, a religious reformer and an admirable potter, but he is not ranked by the French among their sculptors. PIERRE BONTÉMPES was the sculptor of the bas-reliefs of the tomb of FRANCIS I. in the abbey of St. Denis.

GERMAIN PILON, a native of Paris, appears as a very grave man, but he has been called the CORREGGIO of sculpture. Most of his works are found in the churches of Paris, and they are admired for the beauty of the heads and the skill displayed in the treatment of drapery. ALONZO CANO, who is near him, was at one time entitled

the Spanish MICHEL ANGELO. After an adventurous life he entered the Church. NICHOLAS STONE was born near Exeter. He went to Holland and worked for PETER DE KEYSER. In 1619 he was appointed by CHARLES I. master-mason and architect for Windsor Castle, receiving the wages and fee of twelve pence by the day. He was in request for tombs. He died in 1647, and was buried in St. Martin's. An inscription on the wall testified that he was "esteemed for his knowledge in sculpture and architecture, which his works in many parts do testify, and, though made for others, will prove monuments of his fame." BERNINI was throughout his life regarded as a phenomenon. The son of a sculptor, the studio was his playroom, and at the age of eight he modelled a head which astonished the connoisseurs. When he was ten he was allowed to study and model in the Vatican, and at fifteen could produce life-size statues. The group of *Apollo and Daphne* introduced into the relief was cut out of a single block of marble before he had attained his eighteenth year. The tomb of URBAN VIII in St. Peter's, Rome, is one of his undertakings. LOUIS XIII. endeavoured to attract him to France without success. LOUIS XIV. was more fortunate, but in spite of the vast sums expended on the artist he failed to produce a design for the Louvre that was satisfactory. BERNINI was so familiar with the sculptor's art, he could only regard it as a means for exciting surprise. His dexterity in manipulation was wonderful, but it is rare to find any trace of the true spirit of the Renaissance in his work. Sir CHRISTOPHER WREN said he would give his skin for BERNINI's design for the Louvre, and the words suggest the admiration for the Italian which was then general. It was therefore allowable to show GRINLING GIBBONS looking at BERNINI with wonder. He also was a master of manipulation, and the carver of lace cravats and pots of flowers which were moved by the passing of coaches up and down Ludgate Hill must have envied the skill seen in BERNINI's flying draperies. Whether GIBBONS was an Englishman or a Dutchman cannot be ascertained. PIERRE PAUL PUGET was a native of Marseilles, and as he was born in 1622 he was nearly a quarter of a century younger than BERNINI. He made his way to Italy when he was only fifteen, and as he received kindness from PETER OF CORTONA he adopted that artist's work as his model. Many of PUGET's defects are to be attributed to that cause. When he abandoned painting for sculpture he showed a preference for works on a large scale. He had great force, and he attacked the marble without other aid than a very small model of the figure he contemplated; it was not unusual with him to finish one part almost to finesse before the remainder of the block had been touched. CAIUS GABRIEL CIBBER was a Dane who came to England and obtained work with one of the sons of NICHOLAS STONE. Although COLLEY CIBBER wrote many biographies he never attempted a life of his father. CAIUS was appointed statuary to the King's Closet. He produced several works, including figures of *Melancholy* and *Raving Madness*, for Bedlam, and the statues of the kings that adorned the old Royal Exchange; much of the ornament at Chatsworth is due to his chisel. FRANCIS BIRD was CIBBER's successor. He gained the approval of WREN, and was employed to prepare the sculpture for the pediment of St. Paul's. For this immense undertaking he received 1,180*l.*; for the original statue of Queen ANNE, with four figures around the pedestal, he was paid 1,130*l.* All his works are not equally meritorious, and consequently he was subjected to much abuse by POPE and other of his contemporaries. JOHN BUSHNELL was one of CIBBER's rivals. The figures of the kings introduced in the niches of Temple Bar were his work. Unfortunately he was excitable; to demonstrate his superiority he once attempted to construct a colossal Trojan horse. He executed the figures of ABRAHAM COWLEY, the poet, and Sir PALMES FAIRBORNE in Westminster Abbey. The long series comes to a termination with LOUIS FRANÇOIS ROUBILIAC, the Frenchman, many of whose works are to be seen in Westminster Abbey. FLAXMAN said, "His thoughts were conceits and his compositions epigrams." According to HENRY WEEKS, R.A., he was a man of high genius and great knowledge, and his works show "the first regeneration of sculpture from the state of chaos into which it had fallen." ROUBILIAC died in 1762.

BRITISH STANDARD SECTIONS.

ABOUT two years ago a committee was formed under the auspices of the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Naval Architects, the Iron and Steel Institute and the Institution of Electrical Engineers, for the purpose of ascertaining whether the sections of iron and steel which are rolled in this country could be reduced in number and made exactly uniform in dimensions. Although Great Britain is supposed to be exceedingly careless in meeting the demands of trade, there is no doubt that in many ways much labour is undertaken and large sums of money are expended not only to comply with the legitimate requirements of customers, but even with their caprices. In other countries there is more show of willingness, and it may be there are more protestations among manufacturers of a desire to be obliging at any cost, but eventually it will be found that the foreigner gives greater attention to outlay than is done among us.

It was ascertained when the subject was investigated that an infinitely larger number of sections of angles, tees, bulbs, channels and beams were produced in Great Britain than in the United States, Germany or Belgium. The questions naturally arose, how in those countries so vast a trade could be accomplished when the sections were few, and why English buyers often went abroad and made alterations in their requirements in order to favour foreign products? For instance, there are over sixty sections of channel-irons employed in England, while elsewhere a third of that number suffices. In sections of other forms there is no less marked a difference. Now, if it is recollected that the production of rollers for steel is costly, it must be evident that every section which can be dispensed with represents a dead loss. It was therefore concluded that one way towards meeting foreign competition would be by the avoidance of useless sections. With that object the Engineering Standards Committee was constituted, and several of the most prominent representatives of iron and steel production in Great Britain have been glad to render service by acting as members of the various committees and sub-committees. In addition, it is believed that about 30,000% has had to be expended, and it may be assumed that further disbursements will be indispensable.

The first result is the production of nine lists of sections which are recommended for adoption by the committee. It is needless to say adherence to them cannot be enforced, and it is still open to every manufacturer to make as large a variety of sections as formerly. There are, of course, two points of view from which to regard the subject, viz. the producers' and the users'; the latter will require information respecting weights and strength which has yet to be prepared. Many engineers, architects and designers have favourite sections which have served their purposes during several years, and which they may not care to relinquish on the moment. It is, however, an advantage in dealing with wrought-iron and steel that it is always possible to reach a desired degree of strength by a skilful arrangement of available materials. If one standard section does not serve another can be used which will afford an excess of strength without much addition to the cost of construction.

The first list shows sections of angles with equal sides, beginning with 1 inch by 1 inch. The sizes increase by quarter inches up to 3 inches by 3 inches. Then we have 3½ inches by 3½ inches, 4 inches by 4 inches and 4½ inches by 4½ inches. The other sections are 5 inches by 5 inches, 6 inches by 6 inches, 7 inches by 7 inches and 8 inches by 8 inches. The sections will vary in thickness, and it is said that angles ordered to the standard thickness shall be practically accurate in profile, but if the thickness is between, above, or below the standards the flanges will be proportionately longer or shorter than the standards. The profile at the back of the toe will be slightly rounded when above the standards instead of square, but the radii at the root and toe will remain unchanged. In equal-sided angles the thickness of the flanges will be the same. It is suggested by the committee that all angles be ordered by size of flanges and weight per foot. The curves at the root and toes are of a very simple kind which can be easily struck out.

The unequal angles begin with 1½ inch by 1 inch, and proceed as follows:—1½ by 1¼, 1¾ by 1½, 2 by 1½, 2½ by 2,

3 by 2, 3 by 2½, 3½ by 2½, 3½ by 3, 4 by 2½, 4 by 3, 4 by 3½, 4½ by 3, 4½ by 3½, 5 by 3, 5 by 3½, 5½ by 3, 5½ by 3½, 6 by 3½, 6 by 4, 6½ by 3½, 6½ by 4, 6½ by 4½, 7 by 3½, 7 by 4, 8 by 3½, 8 by 4, 9 by 4, 10 by 4.

Bulb angles, bulb tees, bulb plates, Z bars and channels are not much used in building construction, and we therefore need not notice the different sections.

There are thirty sections of rolled beams or joists recommended for use, which are as follows, the dimensions being given in inches:—3 by 1½, 3 by 3, 4 by 1½, 4 by 4½, 4½ by 1½, 5 by 3, 5 by 4½, 6 by 3, 6 by 4½, 6 by 5, 7 by 8 by 4, 8 by 5, 8 by 6, 9 by 4, 9 by 7, 10 by 5, 10 by 6, 10 by 8, 12 by 5, 12 by 6, 12 by 6, 14 by 6, 14 by 6, 15 by 5, 15 by 6, 16 by 6, 18 by 7, 20 by 7½, 24 by 7½. The weights vary from 4 lbs. to 100 lbs. per foot. The flanges slope from the web upwards, and the standard thickness is to be measured at distances half-way between the extreme edges of the flanges and the nearer side of the web. It is suggested that all beams be ordered by depth of section, width of flanges and weight per foot.

The T bars are of the following dimensions, in inches:—1 by 1, 1½ by 1½, 1½ by 1½, 1¾ by 1¾, 1½ by 2, 2 by 2, 2½ by 2½, 2½ by 2½, 3 by 2, 3 by 2½, 3 by 3, 3 by 4, 3½ by 3½, 4 by 3, 4 by 4, 4 by 5, 5 by 3, 5 by 3½, 5 by 4, 6 by 3, 6 by 4, 7 by 3½.

To anyone without experience in the use of steel the recommendations may appear to be insignificant. But the adoption of the sizes will be little short of an industrial revolution. For designers the use of normal sections will be advantageous in saving time, and to the makers of beams as well. It will no longer be necessary to institute inquiries about the obtaining of sections of the dimensions which are sometimes introduced in drawings without any consideration as to whether they are easily obtainable in the market. The number of sections of rolled beams is very satisfactory, and architects are not likely to encounter any difficulty in spans or loads to which one or other section is not equal. The rolling mills can easily produce the standard sections owing to the simple arrangement of the profiles. In the course of a year the sections generally required will, no doubt, be on sale. Meanwhile, and possibly for some time afterwards, the sections which have been already rolled cannot be rendered obsolete; indeed, there will always be use for them. It is not suggested that the new forms will have any advantage in the way of strength. The principle which determined the form of rolled beams is unaltered. When FAIRBAIRN first suggested their employment he thought that not only the I section, but one with a cellular top, or other varieties, might be employed; but experience has shown there is nothing better than the I section, and that has been adhered to by the committee. If we might say so it is not so much an engineering question which is under consideration, but an economical one. The competition with foreign ironmasters, it is believed, will be more advantageously upheld under the conditions suggested, and for that reason there will, we suppose, be little opposition offered to the British standard sections. As Mr. JAMES MANSENGH said when addressing the International Engineering Congress, "much of the real essence of economical engineering is contained in the work of settling standard sections of important constructive materials," and in attaining that desirable end co-operation is necessary.

An International Exhibition will be held at Limoges from May to September this year. The exhibits will be comprised under the heads of education, the liberal arts, general mechanics, electricity, civil engineering, agriculture, horticulture, forestry, metallurgy, social economics, hygiene, special applications of medicated alcohol to motive power, lighting and warming and other departments.

The Three Remaining Bays of the cloisters of the old Priory of St Bartholomew the Great, Smithfield, have now been purchased and a faculty obtained for connecting them with the church by means of the original monks' doorway, which, though at present bricked up, can still be traced in the wall of the south ambulatory. An historical and descriptive lecture on the church will be given on the 21st inst., at 3 P.M., and repeated on the 28th. The crypt and other portions of the church will be open for inspection without any fee, but contributions will be invited towards the cost of the newly acquired cloisters.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VII.

UNITY, VARIETY, CONTRAST, &c.

UNITY may be defined as the maintenance of the prevalent idea in any design, and this is quite consistent with the introduction of adequate *variety* and even *contrast* in detail. Variegated unity is, in fact, a stock expression, though it is better termed "Unity with Variety." It may be easier to describe what unity implies by instancing failure. Regarding the house shown in fig. 50, it is evident that though well balanced, it suffers from lack of unity of design. The spectator's eye is distracted, and cannot find any central *motif*. In all good work—whether drama, novel-writing, music, or pictorial art—the best contains one main plot with various ancillary incidents grouped round it, some perhaps even meandering into byways here and there, but always with the central idea predominant, and keeping within proper bounds all the subsidiary incidents.

It does not necessarily involve lack of unity in a design to employ a combination of two or more different architec-

sight of, and though the sculpture and carving are frequently entirely disassociated from religious forms, yet the whole effect is congruous.

That variety need not destroy symmetry is well known; but it is also true that even an unsymmetrical arrangement of varied features may have an appearance of symmetry, either through these varied features being of minor importance or else through artistic management. In the façade of the Palazzo Pandolfini, Florence, the variations are slight, and certainly do not destroy the symmetry.

These remarks apply not merely to the form of ornamental features, but also to their grouping; where rigorous symmetry is not enforced, variety may be more freely introduced, and frequently with advantage.

The author is tempted at this place to quote *in extenso* a paragraph that appeared in one of the issues of *The Architect* not very many months ago:—"All beauty is the result of harmony, which is not a simple quality, but, as ARISTOTLE defines it, 'the union of contrary principles having a ratio to each other.' Harmony thus operates in the production of all that is beautiful in Nature, whether in the combinations, in the motions, or in the affinities of the elements of matter. The contrary principles to which ARISTOTLE alludes are: those of uniformity and

FIG. 50.

tural "styles," nor is there *per se* any æsthetic objection to such combination; a sentimental objection there may be; but Sir CHRISTOPHER WREN not infrequently combined Gothic and Renaissance in the same building: at times happily enough, though it requires a master hand to preserve the "unities" under such conditions. Opinions seem to differ as to the æsthetic value of the combination in the western towers of Westminster Abbey designed by this architect.

It is, however, not only a question of architectural style, seeing that proportion of parts, the attention devoted to chiaroscuro, and the use made of colour and ornament all have an influence on the preservation of "unity." An example of failure due mainly to excessive colour treatment is met with in London in the Albert Memorial, by Sir GILBERT SCOTT; on a small scale and under a glass case as a museum exhibit it looks sufficiently pretty and satisfactory. On the other hand, the Natural History Museum, London, by Mr. ALFRED WATERHOUSE (see fig. 51), is a fine exponent of the attention paid to unity with an adequate amount of variety. The mediæval cathedrals also serve as examples of the same combination; their main intent (of consecration to Divine ideals) is never lost

variety, for, according to the predominance of the one or the other of these principles, every kind of beauty is characterised. Hence the difference between symmetrical and picturesque beauty: the first allied to the principle of uniformity, in being based upon precise laws that may be taught so as to enable men of ordinary capacity to produce it in their works; the second allied to the principle of variety often to so great a degree that they yield an obedience to the precise principles of harmony so subtly that they cannot be detected in its constitution, but are only felt in the response by which true genius acknowledges their presence. The generality of mankind may be capable of perceiving this latter kind of beauty, and of feeling its effect upon the mind, but men of genius only can impart it to works of art. Throughout the sounds, forms and colours of nature, these two kinds of beauty are found, not only in distinct developments, but in every degree of amalgamation. We find in the songs of some birds, such as those of the chaffinch, &c., a symmetrical division, resembling in some measure the symmetrically precise arrangement of parts which characterises all artistic musical composition; while in the songs of other birds and in the other numerous melodies with which Nature charms and

soothes the mind, there is no distinct regularity in the division of their parts. In the forms of Nature, too, we find amongst the innumerable flowers with which the surface of the earth is so profusely decorated an almost

parts, as also amongst the hills and valleys, the mountain and ravines, which divide the earth's surface, we find in every possible variety of aspect the beauty produced by that irregular species of symmetry which characterises the picturesque."

The foregoing quotation deserves careful study, and is evidently the outcome of attentive observation. Whilst the same catholicity of observation is not a characteristic quality of the writer of the present work, yet one variety of Nature's mathematical treatment he has frequently noted with admiration, and this is the beautifully regular plan assumed by many flowers, whose petals so overlap or meet as to produce a perfect stellaloid by means of the hollow space next the calyx, after the fashion shown in fig. 52.

Monotony has been elsewhere mentioned under the heading of surface decoration, and it must be borne in mind that all monotony (whether of outline or of ornament) is to be deprecated, as being contrary to all the lessons that Nature teaches. If the façade of the Palazzo Farnese be

FIG. 52.

considered, it will be found to be distinctly monotonous in effect, due to the too frequent repetition of the same features insufficiently relieved by varied treatment. A remark once made anent it showed a ridiculous disregard of type and prototype. This was that the Palazzo Farnese "looks like a bank: one would fancy it might be taken out of Lombard Street or some thoroughfare of almost any modern city."

(To be continued.)

RYLSTONE HOUSE, BOURNEMOUTH.

RYLSTONE HOUSE, Bournemouth (see next page) was erected a few years ago for the late Mr. WILLIAM CHARLES LACEY, at that time town clerk of Wareham Dorsetshire. The house was built of red bricks with free stone dressings. The architect was Mr. JOHN TUR LACEY, of London. He was architect and surveyor to the County Fire Office, and died June 14 last year, at his residence, 17 Taviton Street, Gordon Square, and was interred at Highgate Cemetery on June 19, aged sixty-four years. He was born in London, and educated at Eagle Hall Academy, Southgate, having for his schoolfellow Sir JOHN AIRD, M.P., Messrs. W. & J. WATSON, builder W. F. POTTER, and other names now well known in the building trade. Mr. J. T. LACEY married Miss JULIA WHITEAVES, sister of Professor WHITEAVES, of Canada, professor of conchology. Mr. LACEY was succeeded as surveyor to the County Fire Office by Mr. J. J. BISSELL, his late principal assistant. Our illustration is from a pen-and-ink perspective drawing by Mr. W. F. POTTER.

DISCOVERY AT THEBES.

THE great event of the Egyptian season from an archaeological point of view has been the discovery of the tomb of one of the Pharaohs of the eighteenth dynasty, Thothmes IV. For the last two years, says the *Times*, Mr. Theodore M. Davies, an American gentleman who is well known in Egypt, has been excavating steadily and systematically in the Valley of the Tombs of the Kings at Thebes, clearing the rubbish away inch by inch, and so laying bare the bed-rock. He has been rewarded this spring by the discovery of a previous unknown royal tomb. The mummy of Thothmes IV. is in the Cairo Museum, having been found in the tomb of Amenhotep II., to which it had been conveyed by the Egyptian priests for the purposes of concealment, probably in the age of the twenty-first dynasty, but the sepulchre of the Pharaoh has never been discovered, though it was pretty certain that it was hidden somewhere under the debris in the Valley of the Tombs of the Kings.

endless variety of systematic arrangements of beautiful figures, often so perfectly symmetrical in their combination that the most careful application of the angleometer could scarcely detect the slightest deviation from geometrical precision; while amongst the masses of foliage by which the forms of many trees are divided and subdivided into

RYLSTONE HOUSE, BOURNEMOUTH.

The actual discovery was made by Mr. Howard Carter, the Inspector of the Monuments of Upper Egypt, who has been conducting the excavations for Mr. Davies, and it is to his care and practised skill that we owe not only the preservation of all the objects found in the tomb, but also a scientific record of the conditions under which they were discovered. The tomb itself, like the other royal tombs in the same valley, consists of a gallery cut into the heart of the mountain. After sloping downward for a considerable distance, it is interrupted by a deep square well, on one of the walls of which is a band of paintings. On the further side of the well the passage turns back upon itself, and finally opens into a large chamber, at the extreme end of which is a magnificent sarcophagus of granite covered with texts from the Book of the Dead. On either side are smaller chambers, the floor of one of which was covered with mummified loins of beef, legs of mutton and trussed ducks and geese, offerings made to the dead king between 3,000 and 4,000 years ago. Clay seals with the name of the king had been attached to the doors of the chambers, and it is interesting to observe that the Egyptians of the eighteenth dynasty had already to some extent anticipated the invention of printing, the raised portions of the seals having been smeared with blue ink before being impressed upon the clay.

The walls of a chamber which served as a vestibule to that in which the sarcophagus was laid are adorned with a few paintings, and on one of them is a hieratic inscription, dated in the eighth year of Hor-em-heb, and stating that the tomb had been plundered by robbers, but restored as far as possible by that Pharaoh. It was doubtless at that time that the jewellery and other precious objects buried with the king were stolen.

More than enough was left, however, to satisfy the archaeologist of to-day. The floor was literally covered with vases, dishes, boomerangs, symbols of life and other objects of blue faience. Unfortunately, nearly all of them have been wantonly broken; in some cases the damage must have been done by the original desecrators of the tomb, as the breakage has been repaired in the time of Hor-em-heb. Intermixed with the faience were fragments of exquisitely shaped cups and vases of rich blue or variegated glass. There are also fragments of an opaque white glass as well as what would have been pronounced to be the bottoms of modern beer bottles had they been met with on the surface of the ground. Equally

interesting is a piece of textile fabric into which hieroglyphic characters of different colours have been woven with such wonderful skill as to present the appearance of painting on linen.

The great and unique find, however, has been that of the actual chariot which was made for the Pharaoh, and in which he rode at Thebes. The body of it alone is preserved, but in a perfect condition. The wooden frame was first covered with *papier maché* made from papyrus, and this again with stucco, which has been carved, both inside and out, into scenes from the battles fought by the Pharaoh in Syria. The art is of a very high order, every detail being exquisitely finished and the faces of the Syrians being clearly portraits taken from captives at Thebes. The chariot is, in fact, one of the finest specimens of art that have come down to us from antiquity, and that it should have been made for the grandfather of "the heretic king," whose foreign correspondence has thrown such a light on the history of the ancient East, lends to it additional interest. Along with the chariot was found the leather gauntlet with which the king protected his hand and wrist when using the bow or reins.

MANCHESTER SOCIETY OF ARCHITECTS.

ABOUT 450 members and guests assembled at the City Art Gallery on Friday, February 27, and were received by the President and Council. Selections of music were played during the evening by the Manchester Military Stringband, and there was an interesting and representative exhibition of work by the members.

Among the guests who accepted were Mr. Alfred Hopkinson, principal of Owens College; Mr. David Morgan, president of the Cardiff, South Wales and Monmouthshire Society of Architects; Mr. A. H. Crawford, president of Edinburgh Architectural Association; Mr. S. Trevaill, president of the Society of Architects; Mr. John Belcher, vice-president of the Royal Institute of British Architects; Mr. John Slater, vice-president of the Royal Institute of British Architects; Mr. J. Flew, president of the Bradford Society of Architects and Surveyors; Mr. Arthur Clyne, president of the Aberdeen Society of Architects.

NOTES AND COMMENTS.

AN inquiry was lately instituted by members of the Iowa Engineering Society concerning the methods adopted for the appointment of city engineers in the United States. Information was obtained from twenty-five cities. It was found that in nine cases the selection rested with the mayor; in eight with the people; in four with the Commissioner of Public Works; in two with the City Council, and in two with the Civil Service Commission. The opinions of the holders of the offices varied. One engineer said, "There is no way that I know by which merit alone can place a man in this position." Another wrote, "In a city of this size it would be extremely difficult to remove the office out of the sphere of political influence, and I am not sure that it would be an improvement to do so." A third replied, "The office of city engineer is elective and the system from a merit standpoint is a failure. Anyone who hustles can get a nomination, and if nominated by the winning party is elected. From a close examination of election returns it does not look as if merit made any appreciable difference in the vote for engineer." More satisfactory answers were given in other cases. For example, in St. Louis, Mo., it is said:—"Up to the present time politics have not been considered to any great extent in the appointments; merits and not political influence are considered. I would say the only way for an engineer to succeed in a municipal office is not to affiliate with any of the party organisations, but to attend strictly to his duties, and in time the question of politics of an engineer will not enter into the appointment." But the consensus of opinion may be taken as favouring election by the people or appointment by the Civil Service Commission. In Philadelphia the appointments are made after competitive examinations, and in consequence the standard has reached a high degree of efficiency. No less than seventy-five college graduates, representing most of the colleges and universities in the eastern part of the United States, were engaged in the public service as officials of the engineering department.

IT is not often one individual can point to so much success in a few years' explorations as was done by Dr. HERZOG, of Tübingen. Last week he gave a narrative of his operations in the Island of Cos before the Archäologische Gesellschaft in Berlin. It was known that ÆSCULAPIUS was worshipped by the islanders, and Dr. HERZOG was able to discover the remains of the temple which had been long sought after. The building stood on a terrace and was approached by several steps. The material employed was white marble. Near the temple was a medical school, and it is supposed the votive offerings formed a collection that was useful in teaching anatomy. Dr. HERZOG was also able to make several discoveries relating to the Knights of Rhodes, who owned and ruled the island for about two centuries. It is supposed that remains of ancient sculpture found in their castle were derived from the ancient temple.

IT seems now to be contrary to good government for coins to be produced except by the State. But it is well known that from a very early period the archbishops of Canterbury possessed the privilege. It is also believed that in the reign of HENRY II. several of the great barons issued coins. The bishops of Durham, as became such princes, struck pennies from the reign of EDWARD I. to that of HENRY VIII. The Archbishop of York had also his mint. One of the charges against WOLSEY was his introducing the cardinal's hat upon the king's money. Mr. S. W. KERSHAW has a paper in the "Journal of the British Archæological Association" relating to the ancient coinage of Canterbury. THOMAS CRANMER was the last prelate to exercise the right. His initials T.C. were introduced on the coins. Mint Yard is shown on most maps of Canterbury. It was near and around the present King's school. The almonry was CRANMER'S mint. The abbots of St. Augustine's were likewise allowed to coin money. Canterbury also possessed an Exchange, which stood in the parish

of All Saints, High Street; it was bestowed by EDWARD III. on Eastbridge Hospital. There was a mint near the Exchange. In conclusion, Mr. KERSHAW says, "Canterbury, famous from the earliest time, has ever formed a central ground of history in all its departments. Whether we consider the Roman remains, the rich ecclesiastical and domestic work, or the monastic annals which crowd round Christ Church and St. Augustine's, in one and all there is a vast field for study."

ALTHOUGH it is near Edinburgh, we suppose few Englishmen ever heard of Queensferry and Southferry until they were introduced to notice by Sir WALTER SCOTT in the first chapter of "The Antiquary." Yet there were historical associations between the places and England. The queen commemorated by the name was the Princess MARGARET, the sister of EDGAR ATHELING, who married the Scottish king, MALCOLM CANMORE, and became an important influence in the civilising of the North. It is now proposed to utilise St. Margaret's Hope, one of the bays in the Forth, as a naval base. To what extent docks will be constructed as well as fortifications, breakwaters, &c., is not, so far as is known, yet decided. The position is important, and it is possible that the great Forth Bridge might be turned to account as an auxiliary fortification. There are several ironworks in the district, Falkirk being among them. It will be a strange metamorphosis of so quiet a locality when it becomes a naval station. But the prosperity of Fifeshire is likely to be augmented by the realisation of the project even on a restricted scale.

THE twenty-first Congress of the Sanitary Institute will be held in Bradford from July 7 to the 11th. The President will be the Right Hon. the Earl of STAMFORD. The section of sanitary science and preventive medicine will be presided over by Professor CLIFFORD ALLBUTT; the section of engineering and architecture by Mr. MAURICE FITZMAURICE, C.M.G.; the section of physics, chemistry and biology by Professor C. HUNTER STEWART, D.Sc. The lecture to the Congress will be given by Mr. J. SLATER, B.A., F.R.I.B.A. Eight technical conferences will also be held in connection with the Congress, presided over by Councillor W. C. LUPTON, Professor THOMAS OLIVER, Dr. J. SPOTTISWOODE CAMERON, Mr. T. H. YABICOM, C.E., Mr. C. DRABBLE, V.S., Mrs. MOSER, Dr. JAMES KERR and Mr. ISAAC YOUNG.

CATHEDRAL SERIES.—WORCESTER: THE HIGH ALTAR.

DANESFIELD, GREAT MARLOW.

METHODIST CHAPEL, WOLVERHAMPTON.

SEVENTY years ago, when JOHN BRITTON described Worcester Cathedral, he said that a "handsome openwork stone screen closes the back or east end of the communion-table." He believed that the choir and its transept must originally have formed a most splendid architectural design. But "modern whitewashing and fittings-up have, however, greatly deteriorated its effect and the irreverent, theatrical practice of fixing numerous galleries and seats in it for periodical oratorios must continue to deface and injure this splendid part of the church." The reredos shown in the illustration was designed by Sir GILBERT SCOTT, and is a characteristic example of the treatment he considered becoming in a cathedral. The figures under the canopies are CHRIST and the four Evangelists. The sculptors were Messrs. FARMER & BRINDLEY. On the back of the reredos is an inlaid cross with the following inscription:—"In memory of JOHN PEELE, D.D., Dean of this Cathedral from A.D. 1846 to 1874, who erects this reredos in affectionate remembrance of AUGUSTA his wife: this cross is inscribed by the Dean and Carvers and other friends, A.D. 1877."

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. L. Ambler, vice-president, in the chair. The following were elected as members:—Messrs. F. J. Commin, W. Curtis Green, W. Gilbert, F. Jennings, Owen Dudley, G. F. N. Clay and C. F. A. Voysey. Messrs. E. J. Wellman and A. B. Yeates were reinstated members.

The CHAIRMAN announced that a donation of ten guineas towards the new premises fund had been received from the Birmingham Architectural Association. A hearty vote of thanks was passed to the Birmingham Society.

Mr. A. W. S. CROSS, M.A., read the following paper on

Competitions.

As one who is greatly in favour of the system of obtaining designs for public buildings by means of competitions, I am, unfortunately, unable to agree with many of the views adopted by Mr. Cresswell in his extremely able paper which will follow mine. I have had, quite recently, the pleasure of perusing an equally excellent paper on the same subject by Mr. G. H. Willoughby, of Manchester, in which its author, a strong believer in the system, as he has shown by both precept and practice, writing from a standpoint diametrically opposite to that selected by Mr. Cresswell, argues in its favour as follows:—

"From my point of view, it is a mistake to suppose that the profession can dispense with healthy, stimulating competitions. A man never knows what is in him until he has measured himself with his fellows in real honest work of this kind. Consider what a large field for effort is presented to our younger men at the outset of their career, when youth, with its enthusiasm and capacity for work, is so strong. With many the commissions which they have in hand fail to fully occupy their time. Does not the opportunity thus afforded through the medium of competitions, which is, I think, confined to our profession, create, if grasped, a lasting habit of steady, continuous application and activity—a prelude to the time when hands and head will be fully occupied on more certain work? Let me remind you of the endless opportunities which cross our path, through the medium of competitive problems, for the study and investigation of the many kinds of structures the architect of to-day is called upon to design."

These words of Mr. Willoughby represent with more or less exactitude the views of those architects who, while believing that competitions are desirable and tend to the advancement of architecture, are at the same time determined to do their utmost to remedy the undoubted evils connected with the competition system in vogue in this country, which evils, involving as they do many miscarriages of justice and frequent deviations from rectitude on the part of promoters and assessors, must be rooted out, and with this object in view a society for the reform of competitions has been formed, and is now, I honestly believe, doing good work in its efforts to protect members of our profession against the wiles of unscrupulous promoters of competitions. But, after having made good their position with regard to promoters, competing architects should advance a step further and insist upon the employment, wherever practicable, of a jury of assessors in place of the present one-man system, which has proved to be a dismal failure. It is neither desirable nor necessary for me to enter into particulars, or to call attention to specific instances in which flagrantly unfair awards have been made; the general fact is common knowledge, and there are doubtless many members of this Association who have suffered, at times, from the incompetence, lack of sound judgment, call it what you will, of certain assessors.

In France, where, as a matter of course, "they manage these things better," and in America the jury system is now almost always applied to important competitions; in the latter country in accordance with the following code for the conduct of competitions, as presented to the American Institute of Architects at their annual convention in 1900, viz.:—

Form of Competition.—A competition as a means for the selection of an architect may properly assume one of the following forms:—(a) "Limited" to a certain number of architects, each of whom is invited to take part. (b) "Open" to all who desire to enter, or to all of a certain class. (c) "Mixed." Certain architects being invited, but others being at liberty to take part.

Payment of Competitors.—In all competitions the first prize should be the award of the commission to design the building and superintend its construction, and the programme should definitely state that the successful competitor will be so retained, and that he will be paid for his services at the rates established by the American Institute of Architects. To allow for the contingency of delay or of the discontinuance of the work, the programme should provide for a substantial payment to the successful competitor on the award of the competition, such payment to be regarded as on account of the final commission. Payments to unsuccessful competitors should be as follows, viz.:—In limited competitions each should be paid a fixed amount. In open competitions prizes fixed in number and

amount should be provided. In mixed competitions the two classes of competitors should be paid in the manner above described.

The Professional Adviser and the Jury.—It is highly desirable, in the interests both of the owner and the competitors, that a professional adviser should assist in the preparation of the programme, and that the professional adviser, or a competent jury, consisting, at least in part, of experts, should assist in making the awards. The professional adviser or jury may have full power to make the award, or they may select a number of designs, and placing them in order of merit leave the final choice to the owner or his representatives. Wherever possible, the adviser, or the jury, should make a positive report in favour of one design, and recommend the employment of its author as architect for the building.

The Programme.—The programme should be so drawn as to form a contract. It should (a) Name the owner of the structure forming the subject of the competition, and state whether the owner institutes the competition personally or through representatives. If the latter, it should name the representatives, state how their authority is derived, and define its scope. (b) State the kind of competition to be instituted, and in limited competitions, name the competitors, or in open competition, if it is limited, geographically or otherwise state the limits. (c) Fix a definite time and place for the receipt of the designs; the time should not be altered except with the unanimous consent of the competitors. (d) State the limit of cost, if fixed, the desired accommodation, and the conditions respecting the site. (e) Fix uniform requirements for the drawings, giving the number, the scale or scales, and the method of rendering. As the representation of a general scheme (rather than of a design perfectly studied in all its parts) is the object of the drawings, they should be of the simplest kind, capable of explaining such a scheme. (f) State whether the submission of more than one design by a competitor is forbidden or permitted. (g) State whether the competition is to be anonymously conducted or not, and if anonymously, provide the method. (h) Name the judge or jury, or provide a method for their selection. Define his or their power. (i) Provide for placing out of the competition any drawing which violates the terms, or any set of drawings whose authors have so disregarded the terms as to deserve the extreme penalty. (j) Provide that during the competition there shall be no communication upon anything relating to the competition, except in writing, between any competitor on the one hand, and the owner or any representatives of the owner, the professional adviser, or any juror, on the other, and that any information, whether in answer to such communication or not, shall be given in writing simultaneously to all competitors. Give a date after which no question will be answered. (k) Fix the nature or the amount of the awards or prizes. (l) State, in case the professional adviser of jury is not empowered to make the award, in whom such power is invested. (m) Fix the period of time within which the final decision will be rendered. (n) Provide for sending the decision and a copy of the report of the professional adviser or of the jury to each competitor. (o) Provide that no drawing shall be exhibited or made public until after the award, and not then without the consent of the author. (p) Provide for the return of unsuccessful drawings to their respective owners within a reasonable time. (q) Provide that nothing original as to this competition in unsuccessful designs shall be used without compensation to the author of the design in which it appears.

Whilst one may not agree absolutely with each individual clause in the above exhaustive code yet, broadly speaking, it appears to have been carefully and impartially framed alike in the interests of both promoters and competitors, and it is fundamentally sound in its insistence upon the following essentials which should be borne in mind during the preparation of every set of conditions issued to competitors in this country:—1. A definite pledge should be given by the promoters as to their intention to retain the services of the successful competitor. 2. The conditions should be framed to constitute a contract between the promoters and the competitors. 3. The drawings required should be of the simplest kind necessary for explaining the competitors' schemes. 4. A copy of the assessor's report should be sent to every competitor. 5. No communication, except in writing, should be allowed upon anything relating to the competition between any competitor on the one hand and the owner or any representative of the owner, the professional adviser, or any juror on the other.

With regard to (1), this clause is essential to the success of any properly organised competition. Promoters must be brought to understand that the payment of a premium is quite insufficient to reimburse the successful competitor for his outlay of time and money. As to (2), this proposal is an innovation as far as this country is concerned, but it is one that will form, sooner or later, an integral part of the conditions of the competitions for all public buildings. (3) Has been evidently framed with the object of minimising the amount of work

required from each competitor, and any experienced competing architect will vouch for its necessity. (4) Constitutes a laudable attempt to allay many of the heart-burnings that almost invariably follow an award. In my opinion, it is very desirable that a copy of the assessor's report, containing the award and his critical notes on the various designs, should be issued to every competitor. I have here a copy of such a report, kindly lent to me by its author, Mr. Paul Ogden, of Manchester, which is, in my opinion, ideal in its characteristics. It contains photographic reproductions of all the plans submitted, together with the assessor's criticism of each design, by which means competitors are enabled to obtain a very fair insight into the reasons governing the award. The last stipulation (5), although it might perhaps be strengthened, is, I think, a wise one under our haphazard system, or rather want of system. A competitor is often tacitly allowed to obtain special information from individual members of the promoter's committee or from officials and subordinates connected with them, and this course of action is to be deprecated, as the contest between the competing architects should be fought on the information conveyed by the conditions, and by the subsequent replies to questions, and by that information alone.

On the whole I think, gentlemen, you will agree with me that the problem relative to the conduct of architectural competitions having been successfully solved by the American architects, it is the duty of all members of our profession in this country to support the movement that has recently been initiated to insure a similarly satisfactory result here. By doing so you will be upholding the dignity of the profession, for what other body of educated men receives the insults that are constantly offered to us by promoters of competitions, who often advertise for designs for buildings which they have not the slightest intention of carrying out, or for which they have actually selected their architect before the issue of the conditions for their so-called competition? To put it briefly, competing architects must sift the good competitions from the bad ones, and protect themselves against unfair or incompetent assessors by insisting upon the introduction of the jury system of assessing. The only argument I have heard advanced, so far, against the appointment of jurors is that emanating, I presume, from those architects who have too great an appreciation of the value of the fees obtainable under the present system of assessing to make them desire any change; to the effect that the excessive cost of the jury system militates against its adoption, but if—as in America—no first premium be awarded, and the definite commission to carry out the work be substituted, there would not be apparently any insuperable difficulty in providing the necessary funds for the payment of three or more jurors.

Mr. H. B. CRESSWELL also contributed a paper on the subject. He said:—It is six years since I stood in this room, at the invitation of your committee, to read a paper before you on this same subject of architectural competitions which brings us here to-night, and I do not think that the interval has advanced this question any nearer to a satisfactory solution now than it was then. Six years ago the conclusion was forced upon me that arguments and suggestions on the subject of architectural competitions had reached very much the same position in the history of the world as puns, namely, in this, that they had all been made, and I do not think circumstances have changed since then sufficiently to make discussion of this subject more profitable than heretofore.

I would like to remind you that the whole subject of competitions, in almost the same aspects and involving the same dilemmas, the same difficulties, the same differences of opinion, has beset our profession like an incubus, and has provoked lengthy discussions, protracted correspondence in the professional journals, special commissions, sworn fraternities, and self-denying brotherhoods continuously for nearly 100 years. I can assure any one of you who cares to refer to the records which will be found within the walls of this building that he will be truly amazed at the huge amount of energy, mental activity, arguments, research and classification of facts which have been brought to bear, on this subject, and I may add by some of the most conspicuous and able men of their day; and yet, although in the particular of professional assessors, promoters of competitions have fallen partially in line with our views, the main question remains no nearer solution, and the confusion in the conduct of competitions is perhaps as great as it ever was.

I find that the subject of competitions has been prominently brought before us here or at the Institute or elsewhere during past years as follows:—

In 1838 a committee was appointed by the Institute to consider this subject of competition, who, having thoroughly investigated it, seemed appalled by its difficulties and concluded by publishing a report containing much "valuable information," but leaving the remedy very much as it was before, in the hands of the profession. In 1850 the Architectural Association considered the question and drew up a report

containing a code of regulations which it was suggested would meet the difficulties of the case. In 1857 Mr. George Morgan read a paper before the Institute upon this subject, which led to a debate in which everyone agreed again that something ought to be done. In or about 1860 the "Architectural Alliance" took steps to draw up a form of circular suggesting terms of "general conditions" which were sent to such committees and councils as showed symptoms of breaking out into competitions. In 1871, on the occasion of the General Congress of Architects, Professor Kerr read a valuable paper on the subject of the "Commercial Aspects of Competitions." Everyone agreed that something ought to be done. A special committee was again nominated, and deputed by the Congress to investigate the matter and report accordingly. In 1872 the report, together with a code of proposed regulations for the conduct of competitions, was read before the Congress of the year, and the Congress were, with one exception, unanimous in agreeing that something ought to be done. The exception was Sir Edmund Beckett, who made a very able and interesting speech in the character, as architects may consider, of devil (or grocer's) advocate.

I may mention here that it is the recommendations made by this report, revised again in 1883 and in 1892, which to-day stand in the Institute Kalendar as "Suggestions for the Conduct of Architectural Competitions." In 1879 Mr. Thomas Porter read his exhaustive paper on the subject, in which the belief that has been said in demonstrating the suicidal folly of the profession in acquiescing in the competition system is there printed and set down. After hearing that paper everybody was completely satisfied as they had ever been that something ought to be done. It was a past-president of the Architectural Association, Mr. Cole A. Adams, who the next year did—or very nearly did—the necessary "something" by drawing up and circulating a memorial which was signed by 1,300 architects, who there bound themselves to take part in no competition save where a professional adjudicator of established reputation was employed. This was presented at the Institute by the late George Edmund Street in 1881. Since then the subject has been again discussed, and there have been papers read since by Mr. Baggallay and others.

It will be noticed that a periodic recurrence of the subject of competitions is endemic with us—an affection of the spleen—and seems so essential a factor of the healthy existence of our profession that we may at least view this present outburst as an intimation of our healthy existence.

I am not going to restate in detail the injustices and stupidities which have been brought to the charge of those who organise competitions; they are vividly in the minds of all who do, however, briefly propose to remind you how disastrous the main principles which are involved in our system of competitions, because we are apt to reason from our own personal experiences, and personal ambitions and prejudices, and I think that it is this attitude which has produced and promulgated the confusion which makes impossible any chance of that clear view and approach to unanimity by which alone we can encounter and overcome the difficulties we discuss so exhaustively and with such futility. I will ask you to join me in my conviction that we shall never reach a solution until we can make our own immediate interests subservient to wider interests of the profession at large. I will then ask you to let me suggest to you wherein the root of our trouble lies, and to state what I believe to be the only solution which ever be possible until we are a closed profession, and registered and placed under compunction to obey the rules which are made for us.

First of all, I would remind you that competitions do not in any way influence the number of buildings erected. The whole mechanism of competitions effects nothing more than the selection of those particular architects who shall be appointed to execute certain particular buildings. Their justification rests, then, on the substantiation of the fact that the process of selecting architects by competition is better for the profession and for the national architecture than if an architect were selected by his reputation or his proved fitness for the work. The question is not, gentlemen, whether competitions afford a short cut to notoriety for individuals, whether, taken as a whole, that system of selection is the best system of selection. I am not going to urge the reasons which convince me that the competitive method of selection is a method as a frequent usage, and bad in all cases except limited competitions, but I will ask your permission to quote the mature opinion of Professor Kerr on this subject. It is reported to have spoken these words in 1871:—

"The only conclusion I can arrive at with any regard to common sense is that the system of architectural competition is radically unsound in principle, and in practice most injudicial to the profession of architects, both financially and morally. Whether it benefits the public in any way may for a moment be questioned, but even on this point I believe the answer must be eventually in the negative. . . . I have never known any man succeed in establishing by competition

reputation which he would not have better acquired without it, except occasionally a bad reputation, which but for competition he might fortunately have been able to escape. I know of no other temptation in business so subtle as that which assails, as I think, a high-minded man when involved in architectural competition, and especially if he is to be successful. I know of men who have succeeded by competing in attaining to the promise of a position which they were not qualified to hold, but they have never been able to retain it, and have in several cases been ruined in their legitimate prospects by the consequences of such hasty and fallacious good fortune. I do not hesitate to say that competition success leads generally to personal and public disrespect; and this not through jealousy alone or personal offence, but by reason of the ordinary estimate of the qualities by which alone such success can be obtained."

The remarkable emphasis of these words from a man of the experience and acquirements of Professor Kerr justify a dogmatic assertion, surely, that it is doubtful whether the apparent advantages of the competitive method of selection are not abrogated and overshadowed by the grave disadvantages attaching to it, and with that moderate statement before you, I will remind you at what costs and by what burdening of ourselves do we acquiesce in this system of competitions.

There are about thirty-six unlimited public competitions advertised yearly in England alone. The value of the average building is about 9,000*l.*, the number of competitors about forty, and the value of the first premium about 56*l.* (with further premiums aggregating to 52*l.*).

(To be concluded.)

DECORATION OF ST. PAUL'S.

A LECTURE was delivered on Monday evening by Sir William Richmond, R.A., on "The Decoration of St. Paul's Cathedral," before the members of the Institute of British Decorators. Mr Crace presided.

Sir W. Richmond said that his discourse would partake rather of the nature of a causerie than of a lecture. He stood here as a fellow-student who had tackled no doubt a very difficult task, and done it to the best of his ability. They all knew how many differences of opinion there must be with regard to matters of taste. Time alone settled the position which any work of art was to achieve and hold. If what he had done in St. Paul's was proved to have been a mistake 100 years hence, all he could say was he hoped they would crack it all out. Up to the period when what he was inclined to call sham classical became the fashion all over Europe all the churches in Great Britain and France and Italy were decorated with colours. It was the introduction of a noble style—the Palladian—which drove colour away. Therefore he was in a sense taken on the hip when he proposed to colour, frankly colour, a Palladian building; and to use colour, he hoped with discretion, but also visibly. He was told by a great many people that it was an impossible nut to crack, and he said that if it was impossible he would try to crack it. They knew that at the time of the Prince of Wales's recovery from his severe illness a sum of money had been collected for the decoration of St. Paul's Cathedral. That sum of money amounted to something like 100,000*l.*, out of which something like 30,000*l.* was wasted by the authorities in experiments. When he told them that to put up a scaffold underneath the great dome cost between 800*l.* and 1,000*l.* they could imagine that one did not particularly want to make any more expensive experiments with the residue of the money collected. His views respecting a scheme of decoration for St. Paul's were absolutely decided before he was asked even to consider the decoration of the cathedral, and they were decided in a very curious way. When he was a little boy of about thirteen his mother took him to hear the service at St. Paul's, and they sat in the choir. He looked up at that naked roof—that was before he had ever been in Italy or seen a piece of mosaic—and on going out he said, "Mother, some day I will cover that with mosaic." When he was nineteen he made his first visit to Italy, and said to himself then, hard on forty years ago, "I will now begin to prepare myself for the great task that some day come to me." He visited, and he had visited since, all the churches covered with mosaic in Italy, many in Asia Minor and all in Greece; so that in that sense he was prepared, at any rate, to think about the decoration of St. Paul's. There was a meeting of the committee, and he made up his mind to two things, which he would stick to absolutely—one was that the work should be carried out by Englishmen and not Italians, and the other was that he would have nothing to do with that odious modern invention, paper mosaic. All work which was *appliqué* could be done anywhere by one who had perhaps never seen the building in which it was to go. The axiom of all axioms which he would go to the stake for was that all decorative work should be done, if possible, *in situ*;

and after the enormous experience that he had had in covering more or less 15,000 square feet of wall he knew that the axiom was worth going to the stake for, because it was absolutely impossible to tell, excepting on the spot, how colours or even forms were going to appear in given circumstances. He accepted the commission, and said that they must first of all see how he was going to design the choir. He therefore made drawings for the spandrels in water-colour, and took them to the cathedral. His scheme was unanimously passed so far. Then he said that they must understand one another absolutely in one particular—he was not going to submit his designs to the approval of the British public. He knew the British public and he knew the British critic. He knew that the British public had not made up its mind in the least degree as to what it liked, and it was for the artists and decorators to make up the minds of the public as to what they were going to have. Also that band of gentlemen, admirable writers sometimes, who constituted the critics in the Press had not made up their minds either as to what they liked or did not like. They would find one set praising up one class of work, and another set demonstrating its follies, another set advancing current fashion, current opinions, and another set saying that these were all wrong. He determined that he would not submit his work to penmanship. It was therefore decided that a small committee should sit, and that he should, in a sense, be the chairman of that committee, because he did not intend to alter any design of his own excepting from the point of view of either ecclesiology or archaeology. He said, "You must trust me as the artist. I am supposed to know my business. If I make a failure of it there is always Waterloo Bridge and the Thames." Sir William Richmond then proceeded to give a detailed account of his work on the decoration of the cathedral. He concluded by saying that colour could either strengthen the appearance of a structure or weaken it, and he thought he saw indications in England of a willingness to accept a fine colour scheme, if only the architects could be made a little more broad-minded and would cease to say, "We insist upon our noble art standing alone." It never did. It was a most absurd and ridiculous position for the architects to take up that architecture ever stood alone. Colour was introduced into the very first buildings that arose. The Parthenon was coloured from top to toe, and if some of the sham classical gentlemen went into it they would ask to be let out because they would say it was not according to rule. Every Norman church in England was painted from top to toe, and at this moment there were over 2,000 churches in this country, notwithstanding the abominable Puritans and the iconoclasts, which retained vestiges of the Mediaeval paintings, and England was renowned on the Continent for the great number of her decorated churches. Until they got the architect and sculptor and painter to work in common, and not in antagonism, they would never get art in its broad, big, noble sense back into their country.

He began upon the north-east arch of the sanctuary, and all his tesserae were set in cement. The composition of this was wax, lime and resin, and he found the recipe in a church at Boulogne, where he learned that it was used in the decoration of the Baptistery at Florence. In the preparation of the work for the vault alone he had made 3,500 drawings. The chief beauty to be aimed at was to be simple in the design: one of the hardest lessons to be learned was what to leave out. He had made many mistakes, but none in the simplicity of his work. He began by using thirty colours, but soon reduced them to fifteen, and finally to five. The art of stained-glass production was going out of this country. The most beautiful windows ever made were those which were outlined only with lead, and had no pigment applied. It was the paint and not the lead which made windows dark. In insisting upon the appropriate decoration in colour of all churches he stated that there were many churches in England as he had stated, which retained traces of Mediaeval paintings. England at that time had more painted churches than could be found in France and Italy combined.

EXETER CATHEDRAL.

THE following correspondence has passed between the Society of Antiquaries and the Dean of Exeter:—
Society of Antiquaries of London, Burlington House, Piccadilly, W.: February 7, 1903.

Very Reverend Sir,—The Society of Antiquaries of London has had under consideration the proposal to replace with modern glass the painted west window of the cathedral church of Exeter, and at its last meeting unanimously passed the resolution of which I beg to enclose a copy.

The Society has assured itself that the glass in the window is in a sound state, and that its condition cannot furnish any justification for removal. A letter in the *Times* of this morning quotes the late Archbishop as having remarked on the

brilliancy and suitability of the glass. It is then difficult to discover why a large sum should be laid out on such a work, for which there is no structural need, while, as a memorial to Archbishop Temple, the only evidence we have of his views shows that he would certainly have disapproved of such an act.

There is only one reason conceivable, viz. that Peckitt's window is held to be in bad taste; but I need scarcely point out that in such a building as a cathedral this is the most dangerous of reasons, and if admitted to be valid might eventually lead to the destruction of any or every part of all our ancient cathedrals which represent the varying taste of centuries.

The Society is well aware that its protest, and, in fact, any protest from outside, can be ignored by the Chapter, which is free to treat the fabric under its charge in any way that it pleases. But the Society would desire to point out that this very absence of external control makes the responsibility of a Dean and Chapter the greater. The Society would, therefore, venture to ask the Chapter to assure itself of the necessity and propriety of the serious step now contemplated.—Your faithful servant,
CHARLES H. READ, Secretary.

The Very Rev. the Dean of Exeter.

"The Society of Antiquaries of London, having assured itself of the sound condition of Peckitt's glass in the west window of Exeter Cathedral Church, desires to enter a strong protest against its removal.

"The Society is of opinion that the glass is of such age as to give it historical interest and of such merit that its removal would be an act which a future generation of wider artistic sympathy would condemn."

The Deanery, Exeter :

February 9, 1903.

Dear Sir,—The Dean and Chapter of Exeter appreciate the motives of your learned and honourable Society in calling their attention to the grave responsibility resting on them in connection with the contemplated work in their cathedral. They are keenly alive to the responsibility, but they feel that from the nature of things it is a responsibility which they cannot share with others. They have called in as their adviser one of the most eminent architects of the day, to whose care many of the finest buildings in England have been successfully entrusted, and who is, moreover, specially experienced in the special work which is now contemplated; and they venture to think that, having done this, their wisest course will be, not unreservedly, but subject to their collective decision, to follow his advice, and they feel quite confident that when the work contemplated shall have been completed the result will give general satisfaction. As to the letter in the *Times* to which you refer, it is misleading and inaccurate. As to the resolution which you forward, I assure you, without any wish to be discourteous, that it is not in accordance with the facts of the case, and I am at a loss to understand who could have so advised your Society. But my main point is just this—our responsibility is of such a nature that we cannot share with others. We are most anxious, in the face of much ignorant and misinformed criticism, to do that which is necessary and right under suitable guidance.

I am, dear sir, with the fullest appreciation of the motives which have led to this correspondence,—Your obedient servant,
ALFRED MARLBOROUGH, Dean.

Society of Antiquaries of London, Burlington House,
Piccadilly, W. : February 13, 1903.

Very Reverend Sir,—I have to acknowledge and to thank you for your courteous letter of the 9th inst., which I laid before the meeting of my Society last night.

I am now directed to ask you to be good enough to tell me, for the information of my Society, in what particulars the resolution of the Society to which you refer is "not in accordance with the facts of the case."

The Society holds, as you can understand, that this imputation is a grave one.—Your faithful servant,

CHARLES H. READ, Secretary.

The Very Rev. the Dean of Exeter.

The Secretary of the Society in sending the letters to the *Times* remarks:—The first intimation received by the Society was on the day before the public meeting to be held in Exeter, and a telegram was sent to the Bishop protesting against interference with Peckitt's work and asking that the protest might be read at the meeting. A courteous acknowledgment was received from the Bishop's chaplain stating that the telegram had been handed to the High Sheriff, who presided; but it does not appear that the protest was even mentioned at the meeting.

The Society then despatched a competent person to report on the state of the glass, and upon his statement that it was in good condition the Society passed the resolution given below and referred to in my letter to the Dean of February 7. The Dean's reply and my further letter to him of the 13th ends the correspondence, for the last remains without an answer.

There are two points to which attention may be directed. First, although probably no one would claim Peckitt's work to be of the highest quality as stained glass, yet it forms a milestone in the history of the art, and as such is deserving of respect. That it fails to reach the ideal of a modern writer of glass painting, or that its story is "sordid," has nothing to do with the matter. It would scarcely be wise to inquire too closely into the real motives of subscribers, even in church matters. Secondly, the window is said to be in bad taste. But surely, in dealing with a fabric of such slow growth as a cathedral, this is dangerous ground to take. Are the seventeenth-century and later monuments in Westminster Abbey "good taste"? Can the phrase be used, in fact, of a building to which additions have been made from century to century?

I submit that, if the Dean and Chapter of Exeter sweep away all parts of the structure in their cathedral that may not seem to them to be in the best of taste, they will go far to destroy the story of the building, and will have an account to settle with posterity.

The Dean of Exeter, in a letter to the *Times*, says:—Mr. Read is guilty of four improprieties:—(1) He publishes a letter without my consent and without notice. This is unusual. He has done me unwittingly a service by disclosing the reasonableness and courtesy with which I answered his letter. (2) He cites a dead witness in a controverted matter, and, with singular want of honourable feeling, tries to hinder a memorial to a great and noble man, whose name should have been so used, by a statement which the dead man cannot gainsay. The man who cites a dead witness is on a par with the man who writes an anonymous letter. I disallow the dead witness in the name of ordinary propriety; but I do more, I traverse, and am in a position to traverse, the statement, alas! that he cannot speak—that he admired Peckitt's miserable glass. (3) He sneers at the motives of the subscribers to a memorial, whose hearts are aglow with love for that great name, which ought not to have been dragged as a dead witness into this petty controversy. (4) He depends on the authority of an anonymous expert in support of the resolution of his Society, which from its wording is not the resolution of persons directly or personally acquainted with Peckitt's glass, but based on the second-hand evidence of an anonymous critic. I have asked for the name of this anonymous authority, for the date of his visit to our cathedral, and for information as to the methods by which he arrived at his decision as to the value and condition of the glass. None of our officials—they are not absent from the cathedral—knew of this visit. No assistance was asked; it was a clandestine visit, no scaffolding, ladders were used. The inspection must have been very hasty, functory and superficial, and until we know the name of the expert we cannot judge of the real value of the resolution based on his report. I misjudge the readers of your columns if I place much reliance on the opinions of those who can only sneer at dead witnesses, sneer at the motives of others, and expect the public to be guided by a resolution based on the report of an anonymous authority. If the secretary wishes to advertise the Society cheaply he has done so, but not much to their advantage or his own.

P.S.—I can almost hear the indignant voice of my good old friend exclaim—Cite a dead witness? You incur disgrace! Trust to the unsigned report of an anonymous critic? You incur ridicule! It is all of a piece. Dead witness! Clandestine visit! Anonymous critic!

Mr. G. F. Bodley, R.A., writes:—As architectural adviser at the cathedral of Exeter I have been asked to answer objections raised against the removal of the glass now in the west window.

A correspondence on the subject, between the secretary of the Society of Antiquaries and the Dean, appeared in the *Times* of the 6th inst.

I feel sure that it cannot be generally known what a disfigurement the glass is to the beautiful interior of the cathedral.

Painted at a time when glass-painting was a dead art, the window is entirely worthless. In colour it is most inert and in drawing it is beneath criticism. Indeed, it is without merit. The glass, so cruelly crude and harmful to the beauty of the building, seems to pervade the whole interior to its great detriment. It has not age to make it venerable, certainly not any art to make it desirable that it should be retained.

It is the work of Peckitt, a glazier who patched the old work at York Minster. His work there too is most objectionable. The glass in the rose window and the lancets of the north transept in Westminster Abbey has recently been removed and new has taken its place. But the glass here was not so bad as this window at Exeter. It is true that the glass may be a period of bad art, but that is hardly a sufficient reason for letting it remain when an opportunity offers for filling the window with better work, more worthy of the cathedral.

CHARNWOOD FOREST.

AT a meeting of the Royal Geographical Society on Tuesday, Professor W. W. Watts, F.R.S., read a paper on "Charnwood Forest: a Buried Triassic Landscape." He said that the most obvious feature of the present landscape of Charnwood Forest, in Leicestershire, was the sharpness of the contrasts which it presented. Such contrasts at once suggested to the geologist abrupt contacts of two very different classes of rock, and the surmise was correct. The bolder scenery was found to be based on hardened and ancient Charnian rocks of pre-Cambrian age, principally volcanic in origin; the milder landscape was based on the keuper marl of the triassic system, which everywhere rested uncomfortably on the older rocks. The landscape was really a landscape of Welsh type, submerged under the new red marl, the dominant rock of the English Midlands. In many places the cover was thick, and the ancient rocks were for the most part so deeply buried that only their highest points protruded. The new red marl was, indeed, covering a mountain system of which the summits alone were visible. He mentioned Bardonia Hill, Newhurst Quarry, Groby, Sheet Hedges, the quarries about the Brand and Southland, and the district of Woodhouse Eaves as among the best localities for studying the actual unconformable relations of the cover to the ancient floor. It was, indeed, a triassic landscape which was now being uncovered again or "developed" for our inspection; and we were at liberty to use it to picture to our minds the appearance of this part of England as it was seen in triassic times. The trias was a period of desert, salt lake and intra-continental conditions, and we might think of Charnwood as being, at that date, like the mountains in the neighbourhood of the Great Salt Lake desert, which were now more or less buried under the sediments of the ancient Lake Bonneville. His investigations led him to the conclusion that the Mount Sorrel granite was exposed to the sand-blast of wind erosion in the earlier triassic times, and that it acquired its characteristic smoothness and polish, and perhaps its rounding and terracing, as the result of wind erosion in the triassic deserts, before it was finally buried and sealed up under the new red marl. The paper was illustrated by a series of photographic transparencies, showing the remarkable characteristics of the two rock formations described. Professor Watts also exhibited a contour map which he had prepared of Charnwood Forest, and another showing the contours of the ancient rocks of the district.

Professor Bonney, who nearly forty years ago conducted geological inquiries in the same forest, said that Professor Watts had accurately described the interesting process by which nature was carefully taking off the protecting covering that had concealed the ancient Charnian rocks from a remote age.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

A LECTURE was delivered in the hall of the Royal Society of Antiquaries, 6 Stephen's Green, on the 5th inst., by Mr. Percy Fitzgerald, M.A., F.S.A., on "Robert Adam and his Architecture and Art." The chair was occupied by Mr. George Ashlin, president, and there was a large attendance.

The Chairman, who introduced the lecturer, said that it was almost unnecessary to go through that form, because Mr. Fitzgerald's name was well known to all present, and they might fairly assume with confidence that what he said would be of the deepest interest.

Mr. Percy Fitzgerald, who was received with applause, in the course of a most interesting discourse said that the subject of his lecture was one of the most wonderfully endowed men of his generation, a man who was filled with the fullest artistic instinct—one of whom it might well be said that everything he touched he adorned, and one who by instinct reached things which it took others year to effect. Adam was an artist. He was really a most original, brilliant being. Discussing Adam's accomplishments, the lecturer pointed out that he was first an architect who designed and built public buildings, noblemen's palaces and country houses, squares, streets, private houses, theatres. Next he was a decorator—one of the most beautiful and ornamental. He decorated his own houses. His decoration being structural and in relief—not painted—it was inseparable from his buildings, and could not be altered. His arrangements of interiors were all novel and striking—witness his wonderful ceilings which are to-day what they were about 130 years ago. Next he was a sculptor; they knew the wonderful Adam chimney-pieces and his modelled figures for decoration. Fourthly, his ironwork—balconies, railings, fireplaces—all was marked by a wonderful freedom of treatment. Fifthly, he was a great designer of furniture. Everyone knew the wonderful Adam furniture that rivalled that of the French masters under the last Louises. He devised girandoles, vases, cornices, curtains, carpets, paper-hangings. Adam was also a goldsmith, who created beautiful

things in gold and silver and other metals like the work of the old Italian goldsmiths. Further, he was a contractor on a vast scale, the work on his own buildings being carried out in a very businesslike style. Also he was a painter and did landscape and other subjects. He was actually inventor of a style of his own—a unique thing—a style that could be recognised, and had held its ground for 130 years. Not only did he form a style, but he also imposed it on his generation. Adam began his labours about the middle of the eighteenth century, when the old Classical style was in vogue, and his first thought was to find a new style. The lecturer then explained how Adam found beautiful buildings in the cities by the Adriatic, and by modifying their style produced that which characterises his work. Discussing Adam's style, the lecturer said he might be designated a pictorial architect. His designs affect the eye much as a picture does. Examples of his various public buildings and of his interior decoration, ornament, furniture and metal design were then given on the screen, the lecturer remarking that in Dublin he had seen in several houses fine examples of the Adam style of decoration.

A vote of thanks to the lecturer, moved by Mr. R. Carroll and seconded by Mr. Albert Murray, brought the meeting to a close.

TESSERÆ.

Greek Vases.

THE distinguishing features of ancient painted vases are their form, colour, material, weight, varnish, design and inscriptions. From one or other of these signs we are able to determine their authenticity and to judge of their date, which ranges from about B.C. 600 to B.C. 200. The earliest Greek vases are the Archaic Corinthian, made of yellow clay, with grotesque animals in Assyrian style painted in bands round them. The next period may be called the "Panathenaic," dating probably back to about B.C. 500, though we find one in the British Museum dated as late as B.C. 328. They are painted in black on red, and bear the legend "Of the games at Athens," denoting that they were given as prizes to the successful competitors at the Pentathlon, and bearing on each side of the design two pillars with cocks on the top of them, representing the *meta* of the Greek circus. The picture usually represents Athena or a warrior, or one or other of the five games of the Pentathlon—leaping, foot-racing, hurling the quoit and javelin and wrestling. These vases were given full of oil, perhaps because the olive was sacred to Athena, or for the utilitarian reason that the competitors used oil to lubricate their limbs. After this period the Greek artists made vases representing their divinities and scenes from private life, notably representations of banquets and funerals, and it was then, namely, about B.C. 400, that the grand epoch of vase-making was reached. Then came a period of transition which is sometimes called the "Floral period," of which the best specimens have been found at Ruvo and Canosa. M. Lenormant thinks that these vases were made at Tarentum; many of them are of great beauty, but the artists departed from the purity and simplicity of the grand epoch, and loaded their work with scrolls, sprays, gold, colours and other decorations. This period may have lasted down to about B.C. 300, and then, perhaps owing to the introduction of bronze, or perhaps on account of increased population and greater demand, the vases were sent out carelessly finished. The artists degenerated, their drawings became incorrect, their paste coarse, their colours second-rate and gaudy, the slovenly sgraffito was scratched where the careful inscription should have been written, and the period of decadence set in, until, in about B.C. 200, the art was lost altogether and these beautiful vases became things of the past. As to the method of painting them, it appears that when they came from the lathe they were covered with a coat of red paint. The ornaments were then drawn in in black and afterwards the figures were delineated with a stylus. The black background was then painted in, and the finishing touches were put by the artist before the final baking.

The Gothic Renaissance.

Shenstone and Horace Walpole, in the middle of the century, successfully sought to introduce a reform into the arts of landscape-gardening and architecture, of which the chief characteristics were an attention to the natural features of scenery and a revival of the "Gothic" principles of art. In the *World*, a fashionable periodical of 1753-55, formed on the orthodox model of the *Spectator*, we find a fancy for Gothic architecture mentioned as a recent and prevalent whim, likely to be displaced by a still later whim for Chinese construction and decoration. The writer in the *World* speaks of both with equal contempt; but while the Chinese fancy, an exotic imported after Lord Anson's voyage in 1744, proved itself a mere transitory caprice and passed away, Gothicism, the purer kind—for here, as so often happens, real knowledge was

struggling with pretension—held its ground. Horace Walpole was its most efficient advocate and champion. Writing from Worcestershire just at this time, he says:—"Gothicism, and the restoration of that architecture, and not of the bastard breed, spreads extremely in this part of the world." And when in Yorkshire he exclaims with kindling enthusiasm at sight of the ancient remains, "O what quarries for working in Gothic!" His letters are full of this new taste, which for many years was quite the passion of his life. He worked out his own conceptions in what, though it seems to us now but a spurious and flimsy imitation of Mediæval art, was doubtless one of the most important initiatory steps in that renaissance movement which has to so great an extent given the law to our modern æsthetics—the famous toy of Strawberry. And not only in architecture and decoration, but in literature also, Horace Walpole may be said, perhaps by his zeal, to have deserved the meed of originality in this revival more than any of his contemporaries, while, by his lively fancy, he almost anticipated the popularising process of time on the materials before him. Within the ten years succeeding the publication of Percy's "Reliques" appeared Dr. Johnson's and Stevens's editions of Shakespeare, and Warton's "History of English Poetry," both most important labours, as turning up the as yet nearly virgin soil of English philological research. Antiquarianism in the various departments of literature and art now began to form a school of ardent disciples. Dr. Johnson, with sententious condescension, uttered his celebrated dictum, "Whatever withdraws us from the power of our senses, whatever makes the past, the distant or the future predominate over the present, advances us in the dignity of thinking beings. . . . That man is little to be envied whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warmer among the ruins of Iona." Shenstone, devoted to song writing as well as landscape-gardening, found the hunt after old abbeys and old ballads congenial to his sense of the picturesque both in scenery and verse. Captain Francis Grose, from 1773 to 1776, made the tour of England and Wales, and published its results in four quarto volumes of "Antiquities," elaborately got up with descriptions and plates. Gough and Pennant prosecuted their topographical investigations. The Society of Antiquaries put forth in 1770 the first volume of their *Archæologia*. All tended in the same direction. Then, after a short interval, followed the era of the German classics, and of inquiry into the antiquities of Teutonic fable; and, contemporaneously with these, the stupendous wars and convulsions of the French Revolution, giving that impetus to the imaginative faculty which is never so effectually supplied as by the vivid experiences and sharp vicissitudes of human fate.

The Gardens of the Philosophers.

The gardens of the philosophers occupied a surface somewhat exceeding a mile square in the environs of Athens, and extended from the banks of the Ilissus to those of the Cephissus. The centre belonged to the disciples of Epicurus, to the south were those of Aristotle, and northwards the followers of Plato. Never did sects discover less turbulence, nor neighbours fewer jealousies; an alley of olive-trees, or a thicket of myrtles, separated the dominions of system, and served as boundaries in the empire of opinions. Each sect, however, was distinguished by peculiar manners and characteristics sufficiently remarkable. The Epicureans affected no extremes, either of opulence or poverty; observing great simplicity and rigid economy, they did not appear anxious to augment the patrimony of their founder, but when attempts were made to injure this property all the Epicureans in Europe revolted against the injustice. The successors of Plato suffered exceedingly during the wars of Philip, son of Demetrius. Their possessions were then totally pillaged, and they had the misfortune to experience equal barbarity in the days of Sylla. But as the Greeks delighted in the study of metaphysics they discovered their predilection for the Platonists by repairing all the injuries their garden had sustained from those leaders of banditti. At length it became customary among the most distinguished personages to appoint the professors of this sect in the number of their heirs, and by such means the annual income of the community exceeded a thousand pieces of gold. This circumstance indeed must appear very extraordinary, particularly in the eyes of those barbarians who are accustomed to nourish fakirs only and leave the learned to perish. The disciples of Aristotle, occupying the Lyceum on the banks of the Ilissus, were in declared opposition to the humiliating life of the Cynics, and distinguished themselves as far as their fortune would admit by an affectation of splendour. Lycon, who long governed their republic, introduced a profusion until then unknown, and he was even accused of having surpassed the expenses of the Epicureans. It appears in general that the aversion of the philosophers towards the town was still stronger than that of the other Athenians. But depending in some measure on the capital for instruments and other succours relative to the arts and sciences, they adopted under Plato the medium between extremes and inhabited the gardens in the environs of Athens.

It was there in the shade of tranquillity, and far from importunate cries of the vulgar, that he succeeded in forming so many great men, one of whom alone would have sufficed to render a whole nation illustrious. This rural education of the Greeks possessed infinite advantages, as has been often observed, over the method in use among those nations of Europe where youth confined to infected colleges are often once exposed to the three great plagues of luxury, ignorance and prejudice. When the most celebrated philosopher, such as Polemon, had too many scholars to be contained within bounds of a garden, they constructed for them other habitations called Calybia. In these wretched huts, framed of wood and covered with straw, the students of Greece were lodged to their satisfaction, for they endured everything to attain what they called wisdom, and acquire what was termed by the ancients immortality.

Ancient Painting and John Bellini.

The mere reproduction of ancient forms derived from Greek or Roman sources, without reference to the requirements and convictions of the time, can have no influence on the multitude although it may interest scholars. The spirit which inspired Classic art has long passed away, and all attempts to revive it, whether in literature, art or manners, must necessarily fail. The true problem consists in determining how the antique can be practically and usefully adapted to modern ideas. There are no remains of ancient painting as there are of sculpture which can give us any adequate notion of masterpieces of the Greeks or Romans in that branch of art. The head of a Muse in the Museum of Cortona (if genuine) that of a piping Faun in the British Museum, the *Nero* of Aldobrandini in the Vatican, the well-known mosaic of the battle of Issus or Arbela in the Museum of Naples, the wall paintings of Pompeii and Herculaneum, and a few other remains, all works of a secondary class executed for provincial towns, afford probably but a very faint idea of them. They are, however, sufficient to prove that the ancients were well acquainted with drawing foreshortening, colour and composition. But they do not enable us to judge of the full extent to which this knowledge was carried by the best painters of antiquity. We may assume that if the just and noble proportions, the dignified composition and the beautiful forms of Greek sculpture could be combined on the canvas with the highest expression attained by Christian art, and with the colour of the Venetian school, painting would attain as near as possible to perfection. Giovanni Bellini appears to have been the first to attempt this combination, with what success a series of small subjects in the Academy at Venice and a religious allegory in the Uffizi at Florence will show. In the forms and composition remind us of an antique gem, and are united to the most exquisite poetic feeling in treatment and the richest and most harmonious colouring. His picture of "The Bacchanals," painted in his old age for Alfonso I. of Ferrara, and now in the possession of the Duke of Northumberland, shows what he might have achieved had he struck out this path in his youth. Titian appears to have been so much impressed with the beauty of the composition that he was induced to complete the unfinished picture, and to make it the first of a series of four similar subjects, two now in the public gallery at Madrid (a Bacchanalian scene and a "Goddess of Fecundity"), and the fourth, the "Bacchus and Ariadne," in the National Gallery. Nothing produced since the revival of the arts probably affords a better idea of what the highest class of ancient painting may have been than these four pictures. It may indeed be questioned whether without limited scientific and technical knowledge the ancients attained an equal perfection in colour.

The Walls of Colchester.

The walls which were constructed at some date between the invasion of Boadicea and the invasion of the first Saxon settlers are unique among the inhabited towns of Britain. Neither York nor Lincoln nor Exeter, nor even Chester, boast of being still girded by her Roman walls in anything like the same perfection in which Colchester is. Nowhere else in Britain, save in fallen Anderida and Calleva, is the line of old defences so thoroughly complete. But unluckily it is a line only. While the circuit of the walls is so much more perfect than at York and Lincoln, the fragments which remain at York and Lincoln have kept much more of the ancient masonry than can be found at Colchester. Colchester can show far more than can be seen at Chester, where, though the Roman lines are all but as perfectly followed by the later defences, little is left of the actual Roman wall beyond its foundations. It has been in many places patched and rebuilt over and over again; one great time above another, and rebuilding is recorded in the days of Edward the Unconquered. But the wall has a higher historic interest, becomes a more living witness of Roman influence, from the very fact that much of it is not actually of Roman date. The very fact shows far more clearly, far more strikingly, how the arts and the memory of Rome lived on. Whatever be the

of any part of the walls, they are Roman; they are built *more Romano*. It is at Colchester as it is at Trier, as it is at Périgueux, as it is in a crowd of other places where the influence of Roman models had struck deep. In places of this kind the Roman construction lived on for ages. Here in Colchester we have actual bricks of Roman date in the places where the Roman engineer laid them. We have bricks of Roman date used up again in the construction of later buildings. And we have bricks, not of Roman date but of thoroughly Roman character, made afresh at all times at least down to the fifteenth century. Here, where brick and timber were of necessity the chief materials for building, the Roman left his mark upon the bricks as in some other parts of Britain he left his mark upon the stones. Northern England reproduced the vast stones of the Roman wall in a crowd of buildings built *more Romano*, with masonry of massive stones. With such stones again, no less *more Romano*, did Æthelstan rebuild the walls of Exeter. Here at Colchester Roman models were no less faithfully followed; but here the *mos Romanus* naturally took the form of brick, and to build *more Romano* meant to build with brick and not with stone. It meant to build with bricks either taken from some Roman building or cast in close imitation of those which the Roman buildings supplied. In this sense the castle of Eudo Dapifer may be called a Roman building. So may the one tower of Primitive Romanesque to be found in Colchester, which, while other towers of its type are of stone, reproduces in material as well as in form the campaniles of Italy. So may St. Botolph's Priory, second only to St. Albans as an instance of Roman materials, not so much taught to assume new shapes as brought back to their true Roman use before Italy began her imitation of the arts of Greece. But the walls are Roman in a yet stricter sense than any of the other buildings around them. They are the old walls of the colony, in many places patched, in some, we may believe, actually rebuilt. But they have undergone no change which at all destroys their personal identity. The wall is not an imitation, a reproduction, of a Roman wall; it is the Roman wall itself, with such repairs, however extensive, as the effects of time and of warfare have made needful. The walls of Colchester are Roman walls in the sense in which the walls of Rome are the walls of Aurelian.

production and misappropriation of what has been extravagantly produced. It is bad enough when the rates are used for the purchase of land and the erection of huge blocks of workmen's dwellings ostensibly for the poorest section of the community, but unfit for any man having less than 30s per week, but it would be infinitely worse if in these circumstances the authorities having committed the first blunder were allowed to commit another still worse and more pernicious in its far-reaching consequences, viz. letting these houses at less than their commercial value.

The more we look into the matter the more obvious it will be that this one thing—misdirected charity—does more than all else to perpetuate that quagmire of social and moral degradation from which the well-meaning, who cannot find a more wholesome environment, too often perish, and go to swell the numbers who must be provided for in our workhouses, hospitals and asylums.

The Bill at present before Parliament, to empower Boards to grant relief in cases where the pauper is in receipt of an allowance not exceeding 5s. from a friendly society is a step in the right direction, but another step in the same direction likely to be productive of still more beneficial consequences is wanted, namely, to empower Poor Law Boards to administer under certain limitations funds placed at their disposal voluntarily by benevolent parishioners. This would practically constitute each parish council the charity organisation society of the parish, and with proper management would insure the offerings of the benevolent being turned to the best account, and ultimately result in the total suppression of vagrancy—that plague-spot at the root of our greatest social degradation—which still survives and flourishes through the misdirected charity of unthinking people who know not what they do.

I think a scheme could easily be devised by which excellent results would follow from the additional freedom of action, which I suggest should be granted to parish councils, both rural and urban.—Yours, &c,

JOHN HONEYMAN.

Glasgow: March 10, 1903.

Stained Glass of the Future.

SIR,—While agreeing very largely with the general views expressed in the paper read by Mr. Sparrow before the Architectural Association, I think a strong protest is necessary against his narrow definition of what "good glass" is, and his unfair assumption that other glassworkers are all alike fraudulent.

Everyone working in glass for windows is aware how much Messrs. Powell & Sons have done to furnish workers with glass equal in every respect to the old glass, and most of us are equally aware that for certain "antique" colours they are unapproached; but those of us who dislike paint and who are always seeking for the best in glasses, know equally well that there are certain colours and combinations that are not to be obtained of Messrs. Powell. Many valuable and indispensable antiques are produced only by other equally skilled glass-makers.

Mr. Wm. Chance has laboured for many years concurrently with the Messrs. Powell to produce fine antique glasses, working, as they have, along lines suggested by artists and students of old glass, and attempting with success to give to them all that they have demanded. Mr. Wood, of Sunderland, and Mr. Cowper, of Glasgow, are also contributing valuable material to the supply, and as the rejected suitor remarked, "There are others." Messrs. Powell would, I believe, be the first to acknowledge these facts, and unless I am greatly mistaken, do acknowledge it in a most practical and definite manner.

If Mr. Sparrow would extend his outlook, and take the pick of the market regardless of make, many of his limitations would disappear. He would have less need to "plate," and he would discover that Venetian opalescent and gold ruby will "fire." Besides this, his favourite qualities of luscious colour and rich depth could be indulged in to a far greater degree than his limited resources admit of.

Personally, I care not whether my glass comes from Dan or Beersheba, England or America, as long as I can get the richness, depth and quality I want. Sometimes a good thing comes out of Nazareth.

Early English glass originated in the "gin bottle."

Prior's glass is very fine, but being made as easily as a "gin bottle," and having been placed on the market at a price much in excess of "gin bottles," it has of course been imitated. Any gin-bottle blower could blow it and any antique mixer could prepare the metal. The similar glass produced by other makers is as good in all but name, and in some respects, notably in brilliance, it is even better. For such a position as the clerestory windows in Westminster Cathedral, Norman glass slabs are more effective and bright than Prior's glass, and much better metal.

The points of value in these slabs lie in the convexity of the fire surface, and in the clearness and irregularity of the air

The Housing Problem.

SIR,—The sensible and well-timed letter by the Duke of Westminster to the Town Council of Chester, published in *The Architect* of the 27th ult., deserves the earnest attention of all town councils, great and small, which feel disposed to overstep the limits of their proper legitimate duties and trespass on the domain of our parish councils. It is rather humiliating to think that so many people throughout the country who are thought by their constituents wise enough to be councillors should require instruction in the simple, elementary economic lessons so clearly stated in the Duke's letter. There has been of late years evidence of a strong disposition on the part of municipal authorities to err in this way. It does not seem to have occurred to them that any abatement of rent they may think proper to allow below the actual commercial value is *pro tanto* a measure of outdoor relief, which in many instances might be given with great advantage, but not by a town or city council. These bodies have no right to levy rates for the relief of the poor, fortunately, and they have no qualified organisation to undertake the proper distribution of such relief. If, therefore, any such work is to be done the duty must devolve on the parish councils, who are entitled to levy rates for a great variety of eleemosynary purposes, and have duly qualified officials.

It naturally follows that if parish councils are to be dispensers of this variety of outdoor relief they should also be entrusted with the construction or remodelling of houses to be let.

It will, I believe, be found, if this matter be carefully looked into, that this would prove to be the best arrangement possible. The officers of the parish councils, both rural and urban, know the poor of their respective districts; they know those who deserve relief, and they also know in what form it may be most advantageously given. They will take care not to provide more accommodation of the kind than is absolutely required; and will probably be content, so far as practicable, merely to improve existing dwellings and to make them clean and healthful homes for the decent poor they think proper to assist.

With the examples of Glasgow and London before us I cannot doubt that town councils have a tendency to fall into two serious errors in dealing with this matter—extravagance in

bubbles and striations that diffract the light and diffuse it within the glass.

The conclusion that a glass worker would substitute other makes or avoid the use of the two glasses named for extra profit is absurd. Powell's antique glasses, colour for colour, are the same price as those of Messrs. Chance. Messrs. Cowper actually cost more, but the cost of the actual glass in an important window is such a fraction of the whole that it never enters into the artist's consideration. His one point is to get his colour right, and to that end he dips into his stock, usually arranged, somewhat like an artist's palette and regardless of maker, and takes just such bits as fit in with his requirements.

The suggestion that an architect should specify makes of antique glass as he does makes of drain pipes is distinctly humorous. A similar suggestion might be made to the artist in oils, thus:—"Paint the historical panels 10 feet by 6 feet in Jones's colours only, Smith's oils to be used for thinnings." I hardly think any self-respecting craftsman would submit to these limitations, simply because if he did so he would be driven to the shifts that Mr. Sparrow adopts, as painting upon thin brittle sheet glass because his glass won't "fire," and using two or three thicknesses to get a necessary colour.

I have occupied too much space to say anything about Mr. Sparrow's technological remarks, but here again does he not attempt to limit his outlook to his own methods and elevate his own practices into universal principles? Is it not, too, a little bold to say of a common everyday practice among glass workers, it "has never been thought of hitherto"? I refer to the recognition of timbre and texture.

The limitations of the would-be artist in glass are all too narrow, and his opportunities and possibilities all too scarce. There is no necessity to draw unnatural boundaries closer still.

WALTER J. PEARCE.

Manchester: March 8, 1903.

Marlborough House.

SIR,—I notice that in your issue for March 6 you say that the delay in the commencement of the sanitary work at Marlborough House "was due in the first place to the presence of guests for the Coronation, and in the second place to the illness of Professor Corfield, the sanitary inspector for the Board of Works."

As the latter part of this statement is entirely incorrect, I shall be obliged by your stating in your next issue that the sanitary work at Marlborough House was in no way delayed by my recent illness, and was as a matter of fact commenced while I was abroad, and about two months before I was taken ill.—I remain, yours faithfully,

W. H. CORFIELD.

19 Savile Row, W.: March 9, 1903.

[The statement in question was an official explanation.—ED.]

GENERAL.

The Regulations of the Royal Academy are likely to be altered next year. Academicians and Associates will, it is said, be allowed to send in only six works instead of eight, while with outsiders only two pictures will be received.

Two Urns have been found during excavations in Whitgift Street, Croydon, each containing nearly 2,000 bronze coins, in all about 3,800. They were conveyed to the town hall, and afterwards some of them were submitted to the authorities at the British Museum. There it was found that the majority were of the Emperor Constantine, and almost all appear to have been issued from 300 A.D. to 375 A.D. They are in a wonderful state of preservation, and after a little polishing the designs are almost as distinct as in modern coins, while on some the words "Gloria Romanorum" are easily decipherable.

An Automobile Exhibition will be held in the Agricultural Hall from March 21 to 28. Almost every variety of car will be seen.

A Correspondent of the *Standard* in New York states:—Messrs. Horgan & Slattery, the favourite architects of "Tammany," have of late had several designs rejected by the new Municipal Art Commission. Recently they submitted drawings of statues from St. Peter's in Rome and other masterpieces. The Commission disapproved them as "inartistic, crude, unworthy and inharmonious."

Mr. Robert Walter Macbeth has been elected a Royal Academician. He became an Associate in 1883.

Mr. J. Pierpont Morgan has filed plans for a museum to be built of marble next door to his New York residence, in which he will collect the art treasures upon which he has spent 10,000,000 dols. during the past twenty years, and which are now scattered in London and Paris and various places in Italy and Greece.

The Royal Society of British Artists on Monday last elected the following members:—P. Paul, Wallace Rimington, Emile Fuchs, M.V.O., Sydney Lee and J. W. Schofield.

The City Engineer has prepared plans for widening Bishopsgate Street Without, between Angel Alley and the City's boundary, to a uniform width of 70 feet. The outlay is estimated at 333,900*l.* The co-operation of the London County Council is to be invited.

A New Town Hall at a cost of 750,000*l.* is proposed to be erected in Newcastle-on-Tyne.

The Sending-in Days for the Salon of the Société Nationale des Beaux-Arts are from March 9 to 11, except for associates, who have until March 27, and for sociétaires, who have till April 2. Varnishing day is April 15, and at the salon April 30.

Alderman Sir Henry Knight has given notice of his intention to propose to the Corporation of London the necessity of considering the provisions of the London Building Act, 1894, and other cognate statutes, and their effect on the property trade and commerce of the City, and of reporting what amendments are desirable.

The Stevens Institute of Technology, Hoboken, U.S.A. has recently received from Mr. Andrew Carnegie, vice-president of the Board of Trustees, an additional endowment of 125,000 dollars for the Carnegie laboratory of engineering.

An Exhibition of Mohammedan art is about to be held in Paris. It will comprise examples produced between 625 the year of the flight from Mecca, to the end of the eighteenth century in Asia, Egypt, Turkey and Spain.

The Académie des Beaux-Arts have awarded the Archille Leclerc architectural prize of 1,000 francs to M. René Brassart, pupil of the Ecole des Beaux-Arts. M. P. Olmet, pupil of M. Redon, received an honourable mention. The subject was "A Monumental Entrance to a Library."

Remains of a Roman Bath with a large number of drinking vessels were discovered a few days ago in excavation for a new bath in Wiesbaden.

Mr. Briton Riviere, R.A., has presented to the Corporation Art Gallery at the Guildhall his picture "The Temptation in the Wilderness," which was exhibited at the Royal Academy some years ago.

Count Bülow, the German Chancellor, has written to Professor Dörpfeld, the director of the Archaeological Institute at Athens, congratulating him on the appearance of his new work "Troja und Ilion" and on the success of the Institute.

The Transvaal and Orange Colony Railway Conference has decided to recommend a new Natal-Johannesburg line by way of the Wilge river, at an estimated cost of 1,330,000*l.*

The "Deutsche Kunstverein," or Art Union, has during the ten years of its existence expended about 12,000*l.* on works of art. There have been distributed 139 oil-paintings, 30 water-colours, 71 works of sculpture, 868 engravings, 597 illustrated works and 1,068 reproductions of famous works.

The Ziftah Barrage, between Cairo and the sea, forming a complement to the barrages at Assouan and Assiut, was opened by the Khedive last Saturday. The new barrage is 408 yards long, and comprises fifty arches, each 16½ feet broad. There is also a lock 184 feet long and 40 feet wide. The cost has been 450,000*l.*

A Cycle Track is to be laid out along the Cours la Reine between the Place de la Concorde and the Place de l'Alma. If the experiment is successful it may be repeated in other parts of Paris.

Mr. Laurence Hobson will read a paper on Monday before the Liverpool Architectural Association on the "Ancient Churches of Wirral."

The International Society of Sculptors, Painters and Gravers will open their exhibition in Budapest early in April. There will be a British section.

The South Wall of the sanctuary of Peterborough Cathedral is being underpinned. Three stone coffins, one very large and two small ones, and the stem of a Saxon cross, richly ornamented with moulding of a well-known Celtic pattern, have been discovered. The spot is the north-eastern extremity of the Saxon church which was destroyed by fire by the Dane and probably formed part of a monastic burial-ground. Archaeologists believe the small coffins may have been those of the children of one of the kings of Mercia. The cross is to be preserved in the cathedral.

A Paper on "Artistic Fans" will be read before the Society of Arts on Tuesday next, at 4.30 P.M., by Miss Hannah Falck. Sir George Birdwood, K.C.I.E., C.S.I., will preside.

Under the auspices of the Aberdeen Federated Building Trades, a dinner took place in the Imperial Hotel, Aberdeen on the 6th inst. Mr. John Morgan presided, and Mr. A. Hall, carpenter, acted as vice-president.

Plans have been prepared for the erection of a new church and chapel in connection with the Tennyson Road Wesleyan Methodist church, Preston, at a cost of 5,500*l.* The church will provide sitting accommodation for 450 worshippers. The present premises will be continued as an infants' school.

THE

Architect and Contract Reporter.**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 5,000l. Premiums of 60l., 25l. and 15l. will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

CASTLEFORD, YORKS.—March 31.—Designs are invited for free library. Premiums 15l. and 10l. respectively. Mr. H. I. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—April 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums of 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, Wycombe.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60l. and 30l. are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—March 31.—Designs in competition are invited for extension of the town hall. Premiums of 300l., 200l. and 100l. are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000l. Premiums of 75l., 50l. and 25l. respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

SUNDERLAND.—April 30.—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100l., 50l. and 25l. will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

TASMANIAN SOLDIERS' NATIONAL MEMORIAL.—A premium of twenty guineas is offered for the best design for a national memorial to be erected to Tasmanian soldiers who lost their lives during the recent war in South Africa. The cost of the memorial must not exceed 1,000l., and full particulars can be had on application to the Agent-General for Tasmania, 5 Victoria Street, S.W.

YEOVIL.—April 10.—Premiums of twenty and ten guineas respectively are offered for the two best schemes for laying-out a piece of land on which it is proposed to erect a town hall, municipal buildings, markets, &c. Particulars may be obtained from the Borough Surveyor, at the Town Hall.

CONTRACTS OPEN.

ALNWICK.—March 31.—For erection of a 150-quarter malt-house, adjoining the Tweed Dock and North-Eastern Railway sidings at Tweedmouth, Berwick-on-Tweed. Messrs. Brewill & Bailey, architects, 44 Parliament Street, Nottingham.

ASHFORD.—March 16.—For erection of a small scullery in connection with the infirmary of the workhouse, Willesborough, Ashford, Kent. Mr. T. H. Wilde, architect, Albemarle Road, Willesborough.

BARNSELY.—March 16.—For erection of a house and shop at Four Lanes End, Mapplewell. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnsley.

BATH.—March 17.—For general repair of the Bath stone-work to the exterior of the Cross Bath and the west portico of the hot baths. Mr. Alfred J. Taylor, 18 New Bond Street, Bath.

BEDMINSTER.—March 17.—For extension of a factory at Bedminster. Messrs. Oatley & Lawrence, architects, Edinburgh Chambers, Baldwin Street, Bristol.

BRIDLINGTON.—March 18.—For erection of an isolation hospital at Bampton Lane. Mr. A. E. Matthewman, town clerk, Town Hall, Bridlington.

BRIGHOUSE.—March 26.—For erection of a chancel, &c., to St Martin's Church. Mr. C. Hodgson Fowler, architect, The College, Durham.

BOURNEMOUTH.—March 20.—For enlargement of the head post office at Bournemouth. Particulars, &c., may be seen on application to the Postmaster.

BRADFORD.—March 17.—For erection of two shops in Darley Street. Mr. C. H. Hargreaves, architect, Exchange Buildings, Bradford.

COALVILLE.—March 17.—For erection of a pumping station and engineer's cottage at Coalville, Leicester. Mr. Thomas Jesson, clerk, Urban District Council, Coalville, Leicester.

CHESTER.—March 26.—For erection of lavatories in the public market. Particulars may be obtained at the office of the City Surveyor, Town Hall.

CORK.—March 22.—For erection of dwelling-house at Ballinlough Road. Mr. D. J. Coakley, architect, 1 Charlotte Quay, Cork.

CROFT.—March 16.—For erection of four cottages. Messrs. Clark & Moscrop, architects, Feethams, Darlington.

VENTILATE and WARM

ON THE STURTEVANT SYSTEM.

IT EXACTLY MEETS THE RECOMMENDATIONS OF THE GOVERNMENTAL COMMITTEE APPOINTED TO REPORT ON THIS SUBJECT. Send for New Booklet, "A 29."

STURTEVANT ENGINEERING CO. LTD. 147 QUEEN VICTORIA STREET, LONDON.

PARIS. BERLIN. STOCKHOLM. AMSTERDAM.

EAST HAM.—March 16.—For erection of a technical school adjacent to the town hall, and a building for refuse destructor at the sewage works. The Chairman of the Council, Town Hall, East Ham.

ECCLES.—March 16.—For supply of the following goods for the year ending March 31, 1904:—Setts (lonkey, paving, crossing, grit, no granite), flags (natural and concrete), flags (manhole, lamp-eye and gully), kerbs (straight and circular), channel stones (straight and circular), pitch, creosote oil, tar, prepared tar, limestone (broken to various gauges), limestone cubes and chippings (various sizes), granite macadam and chippings (broken to various gauges), castings, pit or river gravel. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

ELLENBOROUGH.—March 16.—For erection of reading-room, &c., Ellenborough. Mr. J. Bell, the School House, Ellenborough.

GLOSSOP.—For erection of four-storey stone building. Messrs. Olive & Partington, Ltd., Turn Lee Mills, Glossop.

GRAVESEND.—March 25.—For erection of an infectious diseases hospital at Whitehall Road, Cobham, near Gravesend. Mr. E. Godfrey Page, architect, 4 and 5 Warwick Court, Gray's Inn, W.C.

HALIFAX.—March 19.—For erection of a residence at Clover Hill, Halifax. Mr. Raymond Berry, architect, Commercial Street, Halifax.

HARTLEPOOL.—March 21.—For erection of a public library in Northgate. Mr. H. C. Crummack, borough engineer, Borough Buildings, Hartlepool.

HULL.—For erection of five new houses, Anlaby Road; new premises, Alfred Gelder Street, and new premises, corner of Anlaby Road and Brook Street. Mr. John M. Dossor, architect, Manor Street, Hull.

HULL.—For erection of offices in Parliament Street. Messrs. Brodrick, Lowther & Walker, architects, Hull.

HUNTINGDON.—March 18.—For erection of post office at Huntingdon. All particulars may be obtained at H.M. Office of Works, &c., Storey's Gate, S.W.

ILFORD.—March 24.—For erection of a crematorium at the City of London cemetery, Little Ilford, Essex. Clerk of the City of London Burial Board, Guildhall, E.C.

ILKLEY.—March 16.—For erection of a cottage hospital at Ilkley. Messrs. Adkin & Hill, architects, Prudential Buildings, Bradford.

IRELAND.—March 17.—For erection of a teachers' residence in connection with Lisnaskea National school No. 2. The Rev. Albert E. Glanville, Newtownbutler, Lisnaskea.

IRELAND.—March 19.—For erection of a convent and chapel, Governors of St. John's Hospital, Limerick. Mr. Brian E. F. Sheehy, architect, 57 George Street, Limerick.

IRELAND.—March 23.—For additions and alterations Listoke House, Drogheda. Mr. Frederick Shaw architect, Drogheda.

IRELAND.—March 23.—For erection of a kiln, bins and other works, at Drogheda Brewery. Mr. Frederick Shaw architect, Drogheda.

IRELAND.—March 26.—For alterations to kitchen and the erection of a new service-room, &c., at the Down District Lunatic Asylum buildings. Messrs. Graeme-Watt & Tuflooc architects, 77A Victoria Street, Belfast.

ISLEWORTH.—March 18.—For demolition of old workhouse premises off the Twickenham Road, Isleworth. Mr. William Stephens, clerk, Union Offices, Isleworth, W.

KEGWORTH.—For erection of a branch store, comprising three shops, at Kegworth. Mr. Ernest R. Ridgway, architect, Long Eaton, near Nottingham.

KENDAL.—March 20.—For erection of three dwelling houses at Burneside. Mr. Stephen Shaw, architect, Kendal.

KNUTSFORD.—March 20.—For the construction of a brikgasholder tank, 92 feet in diameter and 22 feet deep, a boundary wall on the premises of the Knutsford Light and Water Company. Mr. W. S. Inman, secretary, Office, Princess Street, Knutsford.

LAMPETER.—March 21.—For erection of assembly room at Lampeter. Mr. L. L. Bankes-Price, architect, 28 High Street, Lampeter.

LEEDS.—For the erection of a workshop in Bowman Lane, Leeds. Messrs. Elsworth Bros., Bowman Lane, Leeds.

THE BOSTEL FIRE.

THE Coalbrookdale Company, Ltd., are showing at their London showrooms, 221 Queen Victoria Street, their newly-introduced Bostel stove, slow or quick combustion grate, which burns ordinary house coal without smoke, a desideratum which is now universally recognised. This is not, however, by any means its only strong point. Another is that it will burn for about eight hours with a consumption of about 15½ lbs. of coal and no attention. Then it is of very attractive appearance. It is said that it will effectually cure a smoky chimney. It is of the utmost simplicity in working. Fires therein are very easy to light and when lit give out a capital heat. Its peculiarity consists in that it is so made that the fire burns either sunk in the hearth or it can be tilted up to burn with the bars raised. The advantages of this combination are great. No air duct has to be provided through the hearth, yet there is no difficulty in getting the fire to light or to burn up when required. The grate when tilted up induces a quick draught and the fire soon becomes a glowing mass of smokeless fuel; the bars are then lowered to the sunk position, bringing the fire well forward so that practically the whole of the heat generated is given out into the room, and the gases as they pass into the chimney are quite cool. Combustion is slow; the fire will burn for hours without any attention or additional fuel, and the coal burns away to a powder, which falls into the pan below the bars and is easily removed.

TENDERS.

ASHTON-UNDER-LYNE.

For putting-in of water-mains, hydrants, standpipes, hosepipes, extincteurs and other appliances for fire extinction at the hospital now in course of erection. Messrs. JOHN EATON, SONS & CANTRELL, architects, Stanford Street, Ashton-under-Lyne.

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

PRICE

5/- per foot super.

Wilson's Patent
"SAFETY" Pavement
Lights prevent slipping

Wilson's "DIOPTRIC"
Pavement Lights are
an improvement on
the semi-prism at the
same price.

J. THOMPSON, Ramelton, co. Donegal (accepted) £581 0 0

IN the work of demolition which is in progress on the site of Simpson's Restaurant and the old Savoy, Strand, on Saturday morning, two labourers, named Snooks and Lawrence, were injured by falling brickwork. A mass, calculated to be about 50 tons in weight, came down unexpectedly. Snooks was partially buried by the debris, and Lawrence became pinned in an upright position against a wall. Both men were taken to the Charing Cross Hospital and detained.

THE LATE MR. E. H. SHORLAND.

WE regret to announce the death of Mr. Ernest Hooper Shorland, of the firm of Messrs. E. H. Shorland & Brother, of Manchester, which took place at his residence, Brooks's Bar, Manchester, on the 9th inst. Mr. E. H. Shorland was one of the foremost warming and ventilating engineers in the country, and his firm have carried out and have in progress at present some of the most important contracts in the kingdom. The business of the firm will now be under the active management of Mr. F. H. Shorland, who has been connected with his brother in the business all his life.

TRADE NOTES.

A LARGE chiming clock has just been erected upon the parish church at Gaddesby, Leicestershire, by the liberality of Mr. Samuel Greaves, of Kirkby Bellars. The clock is fitted with all the latest improvements, and has been made to the designs of Lord Grimthorpe by Messrs. John Smith & Sons, Midland Clock Works, Derby.

MR. CHARLES E. GITTINS, of Nechells Park Road, Birmingham, has been successful in obtaining the contract for the supply of ironmongery to the City of Birmingham Corporation for the ensuing year for the following articles: bolts and nuts, cut nails, wire nails, coach screws, machine screws, locks, &c.

THE Mayor and Corporation of Leeds have given instructions to make and fix an illuminated turret clock at the new police station and free library, Dewsbury Road, to Messrs. W. Potts & Sons, Leeds and Newcastle, to the design of Messrs. Bedford & Kitson, architects, Leeds, which has to be completed by an early date.

THE tender of the Columbian Fireproofing Co., Ltd., 37 King William Street, E.C., for concrete fireproof floors, roofs, coal bunkers, &c., has been accepted for the electric-generating station at Ipswich for the Ipswich Corporation, and they have now commenced work on it. The architect is Mr. C. Stanley Peach, F.R.I.B.A. We understand the steel works of the above company at St. John's Wood are now rapidly approaching completion.

THE Fearnhead Electric Light Travelling Carrier Fitting is the invention of Mr. A. Fearnhead, of 354 Caledonian Road, N. It has been designed for the purpose of enabling a rise-

and-fall pendant to be moved laterally, so that the position of the light can be altered at will, thus providing an extremely useful fitting for the drawing benches of architects and surveyors, operating tables of medical men, cashiers' desks in banks, railways, &c., cutting tables, &c., &c. The fitting is made in polished brass rod and brackets, with brass carrier, complete with ceiling rose, lamp, opal shade, brass counter-weight and silk flexible cord, and its price is moderate.

ELECTRIC NOTES.

IN pursuance of the resolution adopted by the Marylebone Borough Council, on the subject of the arbitration award of 1,212,000 $\frac{1}{2}$ as the price to be paid by the Council for the Marylebone property of the Metropolitan Electric Supply Company, the opinion of Mr. Asquith, K.C., M.P., a resident in the borough, has been taken as to the "possibility of the award being annulled or modified," and as to the consequences of a failure to carry out the umpire's decision. The opinion of the learned counsel will be made known at a special meeting of the Council. Meanwhile the Council's electrical adviser has prepared a report showing that the undertaking can be worked by the Council at a considerable profit.

At the monthly meeting of the Ludlow District Council a letter was read from the Board of Trade stating that they refused to extend the time of the provisional order for electric lighting, and that unless the Council could show they were going to do the work, they should remove the order. The electric-lighting committee presented a report recommending the Council to pass a resolution to at once put in force its powers under the local Act, such scheme of electric lighting to be in connection with the refuse destructor, and that the requisite permission for loans, &c., be asked from the Local Government Board. The recommendation was adopted.

BUILDING AND BUILDERS.

THE Dawley Urban District Council have instructed Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Wolverhampton, to prepare a scheme of water-supply for their district.

A LOCAL Government Board inquiry has been held at Oakengates by Mr. A. A. G. Malet, M.I.C.E., into the application of the Urban District Council to borrow 18,520 $\frac{1}{2}$ for sewerage and sewage disposal works. The engineer to the

council, Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Wolverhampton, gave evidence in support of the application.

THE annual meeting of the Birmingham Brickmasters' Association was held at the Cobden Hotel on the 4th inst. Mr. Josiah Derrington resigned his position as president upon his retirement from the trade. Mr. Derrington first joined the association in 1864, and has served the trade as honorary secretary, treasurer and president. The members received the resignation with regret, passed a hearty vote of thanks to Mr. Derrington, and requested his acceptance of a testimonial as a token of their esteem and regard.

AFTER a year's work of a dangerous kind on the Smithfield Market, Jamaica Row, Birmingham, without accident, a carenter named Charles Griffiths (22), in the employ of the contractors, Messrs. Fenwick & Co., fell from the roof last week, and was killed. The roof was nearly completed, and the scaffolding was being removed when the accident happened. Griffiths, who was standing with one foot on an iron pillar and one on the roof, had attached a rope to a piece of timber with the assistance of a labourer, and had given the signal for it to be lowered, when he lost his balance and fell a distance of 30 feet. His head struck the granite setts, and on arrival at the General Hospital it was found that life was extinct.

AT Pwllheli on the 10th inst. the first of a series of public meetings was held in aid of a movement to raise about 50,000*l.* for new buildings for the North Wales University College, Bangor. Mr. J. E. Greaves presided. During the meeting the following letter, addressed by the Prince of Wales, the Chancellor of the Welsh University, to Lord Penryon, the president of the college, was read:—"Dear Penryon,—I have heard with much interest of the inauguration of a fund to raise the sum necessary to erect permanent buildings for the University College of North Wales at Bangor. My visit to Bangor last May enabled me to realise the inadequacy of the present buildings both for the accommodation of the increasing number of students as well as for the provision of those new departments, other than those of arts and science, which are necessary to meet the educational demands of the present day. As Chancellor of the University I am anxious to do all in my power to co-operate with the efforts to be made on behalf of one of its constituent colleges. I earnestly trust that our appeal to enable buildings to be

erected worthy of the University and of the admirable site so liberally given by the city of Bangor will receive the generous support of all classes in North Wales." The fund at present amounts to 11,566*l.*, to which the King and the Prince of Wales have given 100 guineas each, Lord Penrhyn 3,000*l.*, the Duke of Westminster 1,000*l.*, and many others large amounts.

VARIETIES.

THE Associate section of the Edinburgh Architectural Association held their sixth ordinary meeting on the 4th inst., Mr. J. Douglas Trail presiding. Mr. James Gillespie read a paper on "English Towers and Spires," in which he dwelt upon the importance of towers and spires in architectural design, pointing out how their use on a building at once added to it that stateliness and dignity which elevation always conveyed. The lecturer contended that for good outline and beauty of detail none could be found that excelled the Gothic spires of England. The position of the central and western towers were explained, and the lecturer concluded with some Renaissance, Scottish and Edinburgh spires. The lecture was illustrated by a large number of lime-light views and measured drawings.

CRAIGLOCKHART public school, the latest addition to the schools under the charge of the Edinburgh School Board, was opened on the 4th inst. The new school, which has been in occupation since the beginning of the year, faces Ashley Terrace, and is situated upon one and a quarter acres of ground, acquired from the Edinburgh Merchant Company. It is a three-storey building, and contains accommodation for 1,534 children. A central hall is provided for both the juvenile and infant departments. These halls measure 68 feet by 30 feet, and round them the classrooms are grouped. A gymnasium and a combined workshop and cookery-room are placed on the top floor. The school is heated by means of hot-water pipes and ventilated by mechanical power. The building is designed in a free treatment of Classic, and the hall in the centre of the building is lighted by large double windows, finished on the first floor with semicircular heads. The wings are marked by pedimented gables, and an ornamental belfry is placed in the centre of the roof. The plans of the building were prepared by the late Mr. Robert Wilson, architect to the Board, the work being supervised by his successor, Mr. J. A. Carfrae.

WRITE FOR QUOTATIONS.

THE new waterworks provided by the Rothwell, Notts, Urban District Council were formally opened on the 28th ult. by the vice-chairman (Mr. R. C. Lane). The new supply comes from the old Shotwell Mill, about 33 acres in extent, purchased from the executors of the late Mr. Wm. Chater, nine acres from Mr. R. C. Lane, and the reservoir site from Mr. J. Stiles, at an inclusive cost of 3,200*l*. The supply is obtained from that land out of the water-bearing strata known as the Northants sand by drains laid below the rock into the clay, and the yield is at the rate of 120,000 gallons per day. The collecting drains lead to a valve chamber, which regulates the supply to three softening tanks, each having a capacity of 33,000 gallons, and to a storage for emergency. The service reservoir has a storage capacity of 200,000, and is provided with high-pressure standpipes by means of which the water level is raised 32 feet higher than the service reservoir in order to cope with property on the highest levels. The town mains are then supplied by gravitation from the reservoir with varying pressures to 75 lbs. per square inch, and fitted with ball fire hydrants about 100 yards apart, air valves, relief valves and sluice valves dividing the water into districts. The old mill pond has been cleaned out and converted into a storage in case of fire, and has a capacity of 500,000 gallons. There is a capital pumping station fitted with machinery by Messrs. G. R. Mather & Son, of Wellingborough, while the whole of the scheme was designed and carried out by Mr. W. T. Pearson, the Council's surveyor. The cost of the work has been about 6,350*l*., which has to be repaid in 28 years, and the cost of the land (3,200*l*.) to be repaid in 50 years.

ELECTRICAL ENGINEERS.

THE annual dinner was held on Friday at the Grand Hotel, Manchester, of the local section of the Institute of Electrical Engineers. Mr. H. A. Earle presided, and a large company included the Lord Mayor (Mr. John Royle), Sir James Hoy, Dr. Edward Hopkinson, Mr. J. H. Wicksteed and Mr. S. Z. de Ferranti. The toast of "The Section" was proposed by Dr. Hopkinson. Manchester, he said, was the largest producer of electrical energy amongst the municipalities of the kingdom, quite apart from traction. The citizens had invested vast sums in connection with the lighting and tramways undertakings. It might be said they had gone on too fast, but his own opinion was that in a very few years they would be able to look back

with feelings of intense satisfaction upon the work of the electricity committee of the Corporation and its engineer in providing for developments which they were sure to witness. In his reply the Chairman said that Manchester was second to no city in the country as a centre for the manufacture of electrical apparatus, and he was glad to know that at Owens College and the technical school the provision for the training of students in this branch of the engineering profession was all that could be wished. Mr. W. J. P. Fawcus proposed the health of the guests. The Lord Mayor, in responding, said there were those who thought that the Manchester Corporation had been spending capital on rather a lavish scale. They had to admit that big sums had been expended in the electrical undertaking of the city, but he was glad to hear Dr. Hopkinson say that they were pursuing a right policy. Mr. J. H. Wicksteed also responded. Mr. S. Z. de Ferranti proposed "The Manchester Technical and Scientific Societies." In responding, Sir James Hoy said he hoped that at the Manchester Technical School, as at Owens College, the provision made for the teaching of the various branches of the science of engineering would be taken full advantage of.

A SCHOOL FOR ENAMELLING AND METALWORK.

It is proposed by Mr. Alexander Fisher, some of whose enamels and metalwork have been seen at the Royal Academy, to open classes for goldsmith's work, silversmithing, jewellery and enamelling, and also for the production of fine work by craftsmen who have had thorough training. Pupils may join for short courses in any of the subjects, or for a complete course of two years' training. The advantages of such an institution cannot be better expressed than in the following letter from Mr. G. F. Watts, Hon. R.A. :—

"I feel the greatest interest in the scheme for the establishment of studios for the study of enamelling and metalwork. It is perhaps of even more importance than may at first appear. The barren conditions of modern life and habits in all those things from which the painter and sculptor derive their inspirations render it almost impossible they should rival the splendid achievements of the past, but the artist in enamels, &c., may still be inspired by what he may every moment see, from the sun shining through a green leaf to the rainbow. The nature and natural effects with which he deals still afford him glorious visions and suggestions. Mr. Alexander Fisher is the one man

NOTTINGHAM INDUSTRIAL EXHIBITION, 1903.

Organisers of the Nottingham Exhibition, which opens in May next under the management of Mr. Charles Imre Kiralfy, are now busy at the erection of the various buildings and the laying out of the extensive grounds, which are so charmingly situated adjoining Trent Bridge.

The industrial and machinery halls are handsomely designed buildings in the oriental style, and the spacious floors are planned so as to give the greatest possible facilities to exhibitors, many of whom have already applied for space.

Arrangements are being made to devote a liberal portion of space to exhibitors in the various trades which this journal represents.

Military bands and popular music of every description will be provided on a lavish scale, and altogether both exhibitors and visitors are being catered for in a manner that leaves nothing to be desired.

In the amusement department a water-chute, circular loggan, fairy river, and all the various attractions which so largely contributed to the success of the late Glasgow and Liverpool exhibitions are being constructed.

Applications for space should be made to Mr. Charles I. Kiralfy, 19 Buckingham Street, Strand, London, W.C., where plans of the Exhibition can be inspected.

PLUMBERS AND THE PUBLIC HEALTH.

Dr. KAYE, medical officer to the West Riding County Council, in a meeting of plumbers and others held on Thursday last at Bradford Technical College, under the auspices of the Bradford District Council for the National Registration of Plumbers, delivered a lecture entitled "Plumbing in relation to Public Health." Mr. Malcolm Paterson, C.E., presided, in the unavoidable absence of the late mayor, Councillor W. C. Paterson.

Dr. Kaye traced the evolution of plumbing from its earliest beginnings, saying that the great change which had taken place should, on reflection, give people some idea of the great extent to which the plumber now contributed to the comfort and enjoyment of life. The field of sanitary knowledge was constantly and rapidly widening, and the plumber must keep abreast of the times. He said improvement in the trade could not be complete until legislation made it illegal for other than a duly certified plumber to practise. Referring to the injurious influence of defective plumbing on health, he observed that neither gases nor germs could pass through a properly constructed and properly laid water trap on a properly ventilated system.

Dr. Kaye classified the measures needed for maintaining the standard of plumbing at the level of improving sanitation under the three heads of registration, education and practical experience, and dealt at length with each topic. He mentioned that there were upwards of 11,000 registered plumbers in England and Wales, of whom 800 were in the West Riding. He also gave advice for the maintenance of the plumber's own health, and congratulated his hearers on being enrolled in the vast army now engaged in the battle against dirt, disease and death.

HOUSING IN CHESTER.

AN inquiry has been held in Chester by Mr. M. K. North, inspector of the Local Government Board, in relation to an application of the Chester Corporation for authority to borrow £2,160 to erect twelve houses in Tower Fields which could be let at 3s. 6d. to 4s. weekly. Evidence was first read in favour of the proposal and then against it.

Mr. H. S. Walley, surveyor, said the proposed cottages were not required, as the supply already exceeded the demand. He had recently visited sixty courts, and was able to say that 90 per cent. of them were airy and good. The Chester Cottage Improvement Company had supplied the existing requirements. Any private builder could erect the cottages cheaper than the Corporation. He had not seen a single case of overcrowding in the courts.

The Hon. Cecil T. Parker, agent to the Duke of Westminster, in opposing the scheme, said the Duke, as a ratepayer of Chester, and a large owner of property in Chester, was opposed to the Corporation proposal. In the opinion of his Grace houses of the description proposed would not cater for

the very poorest and humblest of Chester's citizens in the way suggested, and would not in any way get rid of the difficulty that existed in regard to the slums. If the Corporation were genuinely desirous of getting rid of the courts and alleys it could be done by providing houses such as the housing committee originally contemplated—houses of 2s. and 2s. 6d. per week. In his view this scheme, if carried, would permit the better-off class of workmen taking advantage of the rates, whereas the poorer classes would be still left in the slums. The Corporation ought not to embark on the enterprise unless absolute necessity were shown for their intervention. They ought to abolish the courts first of all.

Cross-examined, witness said the scheme was almost a contemptible one, because it did not deal with the root of the evil at all.

You would have supported a more general scheme which would have rooted out the courts and put in their place respectable sanitary dwellings?—I would have supported the improvement of the slums.

You know that the late Duke of Westminster did not take quite the same view as the present Duke on the question of insanitary property in Chester?—I don't know; he was always a friend to improvements.

Do you remember when Sir Horatio Lloyd made that speech about insanitary cottages in Chester the late Duke wrote to Sir Horatio Lloyd and said there was some land belonging to him in Fellmonger's Yard which he had proposed making an ornamental ground, but which he would give up for dwellings?—Yes; plans were prepared.

That was the late Duke's view. He was so struck with this speech that he gave up his ornamental scheme for dwellings to be put up?—Plans were prepared for that purpose.

But it has not gone any further?—Because the late Duke died.

Alderman Thomas Smith denied that the Corporation had passed the resolutions in support of the scheme unanimously.

Mr. H. J. Price said it was considered that at the present moment it was very inopportune for the Corporation to come forward with the scheme. The rates were exceedingly high, and were likely to become higher.

Mr. Thomas Mills supported the Corporation scheme. He referred to the number of houses demolished by the Corporation, and to the modesty of the Corporation scheme, remarking that to carry out their legal and moral obligations they ought to erect at least fifty houses.

Mr. E. H. Lloyd, in urging the inspector to report against the application, ridiculed the idea that the scheme would provide accommodation for the poorer classes, and pointed out that nearly half the total uninhabited houses in Chester were cottages. If there was the evil in Chester such as had been described, this scheme would not touch it not only because of the prohibitive rents it was proposed to charge, but also account of the ludicrous inadequacy of the number of cottages proposed to be built. If this matter were to be dealt with it could be done best on a commercial basis and by the Corporation Improvement Company, instead of by the Corporation laying it out into further municipal enterprise.

Mr. Smith replied for the Corporation, and the meeting closed.

NATIONAL ASSOCIATION OF MASTER PLUMBERS.

An indenture or agreement of apprenticeship framed by the Plumbers' Apprenticeship Board of London has been adopted in substance by the National Association of Master Plumbers and the United Operative Plumbers' Association of Great Britain and Ireland, as well as by the London Master Builders' Association.

The material points of agreement are (a) the art of sanitary plumbing taught under the indenture is defined as "technical knowledge of water fittings and other sanitary appliances, skill to construct and adjust the same in such manner as to prevent the contamination of air or water in dwelling-houses and other buildings by emanations from drains and sewers;" the apprentice is required to attend approved evening classes of technical instruction; and (c) to attend periodical examinations in technical knowledge and workmanship during term, the final examination qualifying for registration by the Plumbers' Company, or any statutory body established for maintaining a national register of plumbers in the profession.

Under the general provisions of the indenture other branches of trade may be taught, but it is required that instruction in sanitary plumbing should conform to local regulations affecting the efficiency of plumbers' work in its sanitary aspects as defined.

The form has been adapted to the requirements of Scotland.

Classes of instruction are provided by the local educational authorities.

YORK AND THE ELECTRIC LIGHT.

LOCAL GOVERNMENT BOARD inquiry was held at the Guildhall, York, on the 3rd inst., by Mr. F. H. Tulloch, M.I.C.E., relative to the application of the York Corporation for sanction to the extension of the electric-lighting plant. Amongst those present were the town clerk (Mr. R. P. Dale), the city accountant (Mr. J. W. Davison), the city electrical engineer (Mr. C. A. Midgley), Councillor Scott (chairman of the electric-lighting committee), Councillor C. C. Walker, Councillor R. Robinson and Dr. Parker.

The Town Clerk, after stating the object of the application, said that on October 25, 1897, the Council decided to undertake the electric lighting of the city, and directed application to be made to the Local Government Board for their approval to the borrowing of the requisite amount, viz. 20,000*l*. The sanction of the Board was obtained on May 26, 1898, and on August 1, 1899, Mr. C. A. Midgley entered upon his duties as resident electrical engineer. On February 26, 1900, the works were formally opened. On April 2 of the same year the Council resolved that in view of the largely increased demand for the supply of electricity to extend the boiler-house building and provide additional engines, boilers, dynamos, mains, &c., to cope with such demand, and directed application to be made to the Local Government Board for their sanction to the borrowing of a further sum of 20,000*l*. On the same date as this application was made the supply of electric light to consumers commenced. Sanction for the second borrowing was obtained on January 28, 1901.

Mr. Midgley (resident electrical engineer) stated that the works which were laid down by Professor Kennedy when opened on April 2, 1900, were of 320 horse-power, which was equivalent to the supply of power for 6,500 eight candle-power lamps. On October 1 of that year, the beginning of the winter season of 1900-1, they were supplying 4,600 lamps, but by March 1901 the number had increased to 16,300. To meet that extra demand the committee had to borrow 20,000*l*. With this sum the capacity of the plant was raised to 13,000 horse-power, which was equivalent to 20,000 eight candle-power

lamps. The demand further increased, and at such a rate that by March 1902 the number of lamp connections had grown to 32,766. In anticipation of this growth and of the general development he had in October of 1901 submitted a scheme to the Council for the extension of the installation and buildings involving the expenditure of 50,000*l*. The scheme provided for two further engines and dynamos, each of 1,000 horse-power, which would give the plant a capacity of 3,300 horse-power, which would be equivalent to 56,000 eight candle-power lamps. The demand from March, 1902, to date had continued to increase till there were now 42,500 lamps connected with the mains, with applications for 4,000 more lamps already in hand. So far he had spoken only of the 50,000*l* loan. Under the original scheme as laid down by Professor Kennedy the mains were far too small for the requirements of the winter season, 1900-1, and on July 1, 1901, the electric-lighting committee placed before the Council a report asking for leave to borrow the further sum of 10,850*l*. for the extension of the mains and accumulators

The Inspector: These two loans then will keep you going for some little time?—Mr. Midgley: For about fifteen months. You will want more money then in fifteen months' time?—I think so.

BOURNEMOUTH MASTER BUILDERS.

THE annual dinner in connection with the Bournemouth and District Master Builders' Association took place on the 26th ult. at the Bournemouth Hôtel Métropole.

Among those present were Mr. J. W. Davis, the president of the Association, who presided; the mayor (Alderman J. E. Beale), Alderman W. Mattocks, J. C. Webber and C. H. Mate, Councillors W. E. Jones, S. Minty (secretary of the Association), and A. Drake, Messrs W. Hoare, C. Gifford, E. W. Jenkins, G. McWilliam, W. Millard, C. S. Hall (deputy town clerk), W. J. Bacon and W. H. Aish (president and secretary respectively of the Bournemouth Ironmongers' Association), G. Martin, J. A. Nethercoate, F. T. Cutler, W. A. Hillier (treasurer of the Association), Randall-Jones, A. E. Kitcher, D. Drake, Walter Hoare, C. Keep, E. W. Ingamells, I. H. Salt, T. A. Norris Cox, A. Lambert, H. Harding (vice-president of the Association), H. Marshall, president, and A. T. Doggrell, secretary of the Southampton Master Builders' Association, &c.

At the close of the dinner the Chairman proposed the Royal toasts.

STRIPSO

Quickly and thoroughly removes PAINT, VARNISH, STOVE ENAMEL, RUST or GREASE, however old or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

Saves more than half the ordinary cost of stripping Paint and Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer. Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRIAN, Yacht Builder.

Nunsquarter, Kirkecubbin, Co. Down, June 24, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.
11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.

Mr. C. Gifford proposed the toast of "The Imperial Forces," and it was acknowledged by Capt. E. W. Jenkins and Cyclist W. Miller.

The toast of "The Trade and Commerce of the Borough" was proposed by Alderman J. C. Webber and Messrs. Martin and Cutler responded.

"The Architectural Profession" was proposed by Mr. E. W. Jenkins and acknowledged by Mr. Gifford.

In proposing the toast of "The Association," Alderman Mattocks suggested that it would be well if builders and decorators took a little greater interest in technical education in order that they might become more skilled workmen.

The Chairman responded, and said there was no member of the Association who did not wish well to his employes, and they hoped that in return the employes would do all they could for their masters.

Councillor Minty also responded, and incidentally mentioned that according to his calculations the members of the Association paid from 100,000*l.* to 150,000*l.* each year in wages.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, March 2, Mr. J. Patten Barber, president, in the chair, a topical discussion on "Road Traffic in and near Large Cities" was opened by Mr. W. Worby Beaumont, past president, and of which the following is a *résumé* :—

The author first pointed out that the congestion of traffic in the main streets of London and other great cities in Great Britain had intensified to a disconcerting degree in the past few years, and none of the efforts for alleviation had had any marked effect. It would be remembered that he dwelt upon the roads and traffic questions in his address as President in 1898, and referred to changes that were then becoming inevitable in street construction and traffic methods. The time had now arrived when it was imperative that the traffic requirements must be faced by the governing authorities. A great increase in the size and number of main streets or arteries must be provided for, and every opportunity must be taken before the difficulties in the way became greater than they were even now.

The difficulties relating to road traffic in and near large cities manifested themselves chiefly by the congestion or not-room-enough conditions observable every day. The cause of

that was, in most places, the gradual conversion of a business and residential centre into a vast congeries of offices and warehouses, the workers in which no longer resided in the houses in that centre, but at various distances miles away from it.

The people going to and from their offices and the merchandise going to and from the warehouses might be reckoned thousands as compared with the numbers which would obtain with the requirements of the residential population for which the streets were originally made. Not only had those houses increased in business requirements demanding traffic facilities but increase in the number of houses, offices, &c., had taken place along the old lines of route which had in effect been lengthened and lengthened, while their width remained unaltered. Moreover, tangled masses of lanes and alleys where once were houses and cottages with gardens round them had grown into business hives, all having outlets on the few arteries and adding to the demand for space in the already congested thoroughfares.

The cities had, in other words, developed by accretion along main thoroughfares, and by internal growth, and at the time had it appeared to be absolutely incumbent upon the local or State authorities to decide upon the laying out of new main thoroughfares on broad principles. The cities had grown gradually like vast extensible bottles, the necks of which had remained unaffected in size or number, until now they were utterly inadequate for the requirements of the vast population. They were, in fact, like a great water supply system, the branches of which had enormously outgrown the capacity of the mains.

The difficulties were becoming greater because the rate of growth of wheeled traffic was greater than the rate of growth of the population, partly in consequence of cheapened road surface conveyance and partly because of the distances growing more and more beyond the walking distances for the masses. In some of the suburban districts and in country roads tramways had added materially to the convenience of suburban and outlying populations, but tramcars in city streets were the cause of frequent blockings of the traffic, their hard and fast line of route made them incapable of accommodating themselves to the other and more numerous vehicles. That difficulty was greatly increased in many districts where the great growth of branch and suburban populations had increased the local traffic on the main roads and the number of vehicles which must be accommodated outside the business establishments along them.

ESTABLISHED OVER
50 YEARS.

The great question was, How is the conducting capacity of the existing principal thoroughfares to be increased, and how the new main thoroughfares to be obtained on anything like a satisfactory principle or design? There could be no doubt that much of the difficulty in London would be removed by the coming general use of motor vehicles for all purposes, firstly, because of the smaller space they occupied as compared with horse vehicles; secondly, because of their manoeuvring capabilities; and, thirdly, because of the greater speed they could make possible. That might be said to be an alleviation which would come of itself, but that was only partly true.

The regulation of street traffic must be something more than mere crossing work. The power of control of heavy, slow traffic must be given to the police authorities, so that street and road capacity should not be thrown away, as it was now, by careless and bad drivers, who wasted several feet of the side of the middle of the road, which could not be used by other vehicles. Drivers of heavy vehicles and of omnibuses habitually wasted the road space now, and it should be within the power of the police to stop that by penalty for disobedience of regulations. The maintenance of the road or street surfaces could be much better than it was now, and more continuous vehicles of every kind should be fitted with effective brakes.

The great necessity, however, was for more and wider main thoroughfares. It meant, in fact, the Haussmannising of a great part of London, and it meant that London must recognise as a hard fact that immense sums of money would have to be spent to remedy the evil of past neglect, and it must wake to its duties of to-day to secure the planning of a well-considered system of wide and well-made thoroughfares into and out of the growing London before building operations made it as costly, and in some respects impossible, as it was now nearer the centre.

Improvements in the modes of locomotion would do much, but at the present rate of growth of wheeled traffic it would not do more than provide for that increase even with great improvement and extension of the chief thoroughfares. Well organised motor omnibus services would save much in space and time, but that would not be until omnibus companies could use motors on a larger scale, so that no vehicle should run more than a certain maximum per day, and so that the mechanical requirements of a thorough system of daily examination, adjustment, repair and making ready were perfectly carried out under a properly organised staff.

In conclusion, Mr. Beaumont observed that improvements in the streets and roads must be taken in hand seriously and at once, for London was a vast hive, into and out of which not only all the bees flocked in the morning and left at night, but into and out of which all the carriers of their honey did the same through a very few small doorways.

A long and interesting discussion followed Mr. Beaumont's opening remarks, during which a consentaneous opinion was expressed as to the necessity of improving the existing condition of things, although a variety of conflicting views were advanced as to how improvement should be effected.

THE MANCHESTER DOCK EXTENSION.

THE construction of the immense new dock on the site of the old Manchester Racecourse is proceeding apace. Within the last few days the contract for the erection of transit sheds along the southern side of the dock has been let to Mr. Henry Lovatt, of Wolverhampton, and within a few weeks the builders will be at work. These sheds will, when completed, form a range of buildings 2,250 feet in length and 125 feet wide and three storeys in height, with flat roofs specially constructed for the storage of merchandise. There will be five sheds, separated as to the lowest storeys by gaps 25 feet in width, but connected as to the upper floors by covered gangways. Four of the sheds will be 425 feet long and one 450 feet long, and the total area of their floor-space (including the flat roofs) will be 22½ acres. The lowest floor will be on a level with the quay, in order to permit the ingress and egress of waggons, and railway lines will be laid both in front of the sheds and behind them. In front—that is, between the sheds and the water side—there will be a paved road with three sets of rails, one for electric cranes and two for railway waggons; whilst in the rear of the sheds will run another broad paved road with two sets of rails. Electric instead of hydraulic cranes are to be installed for two reasons. The hydraulic cranes used on other parts of the docks are capable of lifting 30 cwt., although in ordinary practice it is found that the load to be lifted is often as small as 5 cwt. or 10 cwt. But the power expended by the hydraulic crane is always the same, be the load great or small. In this way a considerable amount of power is wasted. The electric crane, on the other hand, uses only so much power as is necessary to cope with its load. The electric crane, moreover, works

noiselessly, with the practical advantage that the men working with it are able to hear one another speak. Therefore the electric crane has been preferred. The railway tracks between the waterside and the sheds will enable cargo to be transferred directly from the steamers' holds to railway waggons. This cannot be done, of course, with all cargo, but it is calculated that over 25 per cent. of the inward cargoes received at the Manchester docks can be so treated, with an obvious economy of time, labour and shed accommodation. At the back of the sheds there will be a verandah enabling luries and railway waggons to load or unload under cover.

Perhaps the most interesting feature of the new transit sheds, apart from their great size, will be their structural character. According to the *Manchester Guardian*, they will be built without brick, stone, mortar, wood or girders of iron or steel. The whole of the buildings, foundations included, will be of ferro-concrete, upon what is known as the Hennebique system. This consists of Portland cement concrete combined with steel rods and hoop-iron bands or stirrups in such a way as to form a beam in which each of these materials shall develop the maximum of its useful properties, the concrete acting in compression, the steel in tension, and the hoop-iron (embedded in the core of the concrete) holding them solidly together. The walls, pillars and floors will be of the same material. The principal advantages claimed for this system of construction are incombustibility and, what is not quite the same thing, fire-resisting capacity; absence of joints, rivets and bolts, so that the work forms one solid mass; durability, facility of execution, and the fact (important in dock warehouses) that the buildings so constructed are proof against rats. This system of construction is a French invention, and was employed in some of the Paris exhibition buildings, which have been permanently preserved. Both it and other systems of ferro-concrete construction have hitherto been used more largely by continental than by British engineers and architects, although examples of the Hennebique system are to be found in the Southampton cold store and lairages, the Great Western goods and grain warehouses at Brentford and Plymouth, the London and South-Western cargo-sheds at Southampton, the Co-operative Wholesale Society's new warehouse at Newcastle-on-Tyne and some other buildings. The Manchester dock transit sheds will, however, be by far the largest range of ferro-concrete buildings as yet constructed in this country. Associated with Mr. Lovatt in the contract is M. Bruder, who erected the Hennebique buildings at the Paris exhibition, and

it is probable that in the first stages of the work some skilled French assistance may be needed. But Mr. Hunter, the Ship Canal engineer, has great confidence in the versatility of British labour, and he believes that English workmen will very quickly master all that there is to be learnt about the handling of the new material. As to the appearance of the transit sheds when finished, it is to be feared that they will be sufficiently ugly to satisfy the most exacting utilitarian. They will be nearly half a mile long, flat topped, a dirty drab or grey in colour and devoid of any kind of adornment. But when they are seen receiving the cargoes of fine steamers like the *Manchester City* and *Bostonian* simultaneously they will be not altogether displeasing to the eye of the Manchester citizen.

The dock itself, of which they are to be but an adjunct, has likewise some peculiarities of design. Instead of solid masonry walls like those of the existing docks, it will have walls consisting of a series of masonry piers and arches, with the dock-side or bank sloping behind them. The design may be roughly conveyed by the image of an ordinary sloping canal bank, with a miniature railway viaduct standing in the water immediately in front of it and connected with it by a solid platform. When the dock is filled with water, however, this peculiarity of its construction will not appear, for the water-line will be above the level of the arches, and only the super-imposed wall will be seen. One advantage of this pier-and-arch wall is that when a large steamer is moving along the dock to or from her berth other steamers already moored at the quayside will not be disturbed by the displacement of the water to the same extent as if the wall were flat and solid. This "ranging" of steamers at their moorings when another passes them in narrow waters is a serious inconvenience, and has caused a certain amount of trouble at the Irwell Park wharf and other places in the Canal. The depth of the new dock is to be 28 feet—2 feet more than the present depth of the Canal, and the same as the depth of the lock sills. The dredging of the whole Canal to this depth will of course be undertaken when the increasing size of steamers makes it necessary. The contractor for the new transit sheds has engaged himself to have them finished within two years from the beginning of the building, and we understand that a beginning will be made next month. The new dock will, it is hoped, be ready for opening in July 1905, and there is no reason to fear that when that time comes the trade of the port will not have attained to such dimensions as to require the abundant additional accommodation which will then be at the Canal Company's disposal.

The Architect.

THE WEEK.

WE have several times warned architects and engineers as well as contractors about the risks they incur when they carry out the commissions of local boards and corporations without agreements bearing a common seal of the authority. It is, we allow, difficult to imagine that Englishmen who claim to be honest and honourable in their private business will conjointly repudiate indebtedness on account of so miserable a subterfuge. But instances so often arise there are grounds to suppose the weakness is more general than is believed. The latest has caused some surprise among lawyers, for, contrary to the majority of precedents, it has ended in favour of the engineer. We refer to *LAWFORD v. Billericay Rural District Council*, in which the Court of Appeal has just given a decision. Mr. *LAWFORD* is an engineer with much experience in sewerage and other sanitary works. In July 1899 he was formally engaged as engineer by the defendants, and the agreement was under their common seal. In the next year he received verbal instructions to undertake similar work in connection with an extension of the district. Mr. *LAWFORD* wrote to the clerk defining his position, and arranging for payment of his fees. He was informed that the Council were agreeable to the terms. His work was duly performed. Tenders were sent in, but one was not accepted. Plaintiff's claim for payment was met by the announcement that there was no valid agreement as regarded the extension, because it was not under seal. It was acknowledged that instructions were given and that the work of the plaintiff was necessary. Mr. Justice *DARLING* at the hearing of the case gave judgment for the District Council on account of the informality. In the Court of Appeal Lord Justice *VAUGHAN WILLIAMS* relied on the judgment of Mr. Justice *WIGHTMAN* in *CLARKE v. Cuckfield Union*, and on Lord *BLACKBURN*'s interpretation of it. In that case it was declared there was an implied contract, although not under seal. The Lord Justice said that as, in the present case, the defendants had also accepted and availed themselves of the services and work of the plaintiff there was an implied contract to pay for them. In that opinion Lord Justice *STIRLING* and Lord Justice *MATHEW* agreed, and accordingly the appeal of the plaintiff was allowed. It is to be devoutly desired that nothing will arise to admit of a return to the belief in the indispensableness of a common seal through which so many have suffered.

If the ancient port of Sandwich were only surrounded with a more agreeable landscape, and if the sea would return a little nearer it would become an attractive watering-place. The quietude of the town and the apparent absence of out-of-door life make a novel sensation on a visitor. But it requires some courage to remain there for a week. It is doubtful whether Sandwich derives much benefit from its antiquity, for excursionists from Ramsgate or Dover seem to be in a hurry to escape from streets whose silence suggests a period of plague or other visitation. It is therefore the more creditable to the Corporation of the town that they have lately resolved to restore the old Barbican. It has been allowed by their predecessors to fall into a state of decay, which could have been prevented by timely reparation at a moderate cost. It will now be necessary to renew the roof-timbers and weather-boarding, to replace the tiles, and other indispensable work, besides removing cement facing and other excrescences. Mr. *JENNINGS*, the diocesan architect, has been entrusted with the work, and we have no doubt all the operations will be carefully performed. Sandwich will have a more becoming and impressive entrance on one side, which will not be out of keeping with the sleepy old buildings within the town.

It is difficult to make ends meet in the Hôtel de Ville of Paris, and a special committee was lately appointed to consider whether some means could not be discovered or invented to increase the municipal revenue. The new taxes have not only irritated people, but they have failed to obtain the amount estimated. The report of the

committee cannot be considered as satisfactory. The difficulty of the case is suggested when it is found that the defacement of several municipal buildings is recommended in order to convert the walls into advertisement hoardings. An effort is also to be made to extract from the railway companies a royalty on the advertisements in the stations. It is also proposed to reduce expenses. The first victim selected is the Bourse de Travail, an immense building of architectural merit near the new post office, but which from its large hall and chambers could be utilised as a supplementary Bourse. It was intended as an offering to conciliate the working classes, but as an institution it is a failure, although it allows of a great many appointments with salaries paid by the city. In such a crisis as the present it is politic to demonstrate that financial reforms must be submitted to in the head offices of the municipality—in the Hôtel de Ville itself. The system carried out in that establishment is marvellous. Every department is divided and subdivided, and it might easily be supposed there are more officers than men. M. *BOUVARD*, who is supreme in all that relates to architecture, has recognised that simplification is inevitable. It signifies that there must be a resignation of several officers. He also considers that the Departments of the Prefecture of Police and Public Assistance can likewise be diminished. The engineer of the Water Department is not satisfied with recommending reductions of the staff, for he proposes to become more exacting in the charges for water, and in the prevention of waste. At present the reforms are only on paper, and it remains to be seen whether the Council will have the necessary courage to make the desired experiments.

THE late Dr. *BRADLEY*, who died last week, had gained a reputation as a head-master before he was appointed to succeed his friend, *ARTHUR PENRHYN STANLEY*, as Dean of Westminster. When he came he found "a ruinous fabric and a bankrupt Chapter." It seems incredible that a building so renowned should be allowed to fall into a state denoting impending disaster. The ancient revenues were in the hands of the Ecclesiastical Commissioners, but without a special Act they could not be assigned in part to works of restoration. It was necessary also to suspend a canonry in order that the interest on the sums raised should be paid. As was to be expected, some of the works carried out under Dean *BRADLEY*'s rule of twenty-one years did not meet with the approval of all architects. But there could be no question of the spirit animating him. He had no fads of his own to gratify, and he trusted implicitly in the recommendations of his advisers. It is claimed for him that he made the services in the Abbey more popular, and indeed it was his ambition that the people of London as well as visitors should take an intelligent interest in the edifice, and realise that its architectural merit was worthy of its historic associations.

ALL curators of museums and libraries have a belief in Providence, for they sometimes overcome difficulties in a mysterious way. The Bodleian, for instance, possesses an unique copy of the Mentz Bible, which is incomplete through wanting about twenty pages. But some years after it was acquired a collection was bought in Venice, and among the fragments were the missing twenty pages, which are still kept apart as a testimony of gratitude for good fortune. A similar surprise has occurred in Florence. The famous François vase, which was considered by some authorities to be the most valuable of all in Europe, was destroyed maliciously, not by a drunken visitor like the Portland vase in the British Museum, but by one of the attendants who should have been its guardian. The numerous fragments were gathered, and then put together with that marvellous dexterity which is possessed by experts of museums. There was, however, one void which could not be filled in. An official appeal was therefore made, begging for the return of the precious fragment. In such cases there is always a risk that a finder would set a higher value on treasure-trove. Fortunately more generosity was exhibited in this instance. The fragment has been returned anonymously, and the vase will henceforth be revered like the Portland vase, for it now has the additional interest of being a sufferer, and it is to be hoped it will be preserved alike from drunken visitors and enraged officials.

TYPES OF COSTUME: AMAZONIAN, TROJAN, DACIAN.

THOMAS ROGER SMITH.

TO anyone who was acquainted with the late Professor ROGER SMITH some thirty or forty years ago, his appearance of late must have caused pain. With a man less, resolute his arthritic affliction would have been taken as a necessity for retirement from business. But ROGER SMITH was too courageous to submit, and he fought on until the close of last year, when it was no longer possible for him to maintain his ground. His spirit continued to be unbroken up to that time, and he was as well able to give directions, to sit as arbitrator or to appear as a witness as if he continued in the enjoyment of bodily health and was free from physical disability. The pathetic spectacle he presented was one which always wins respect, for it was that of a brave man struggling with misfortune and without the least diminution of his courage. But the call which could not be resisted came on Wednesday in last week, when he passed away, and his loss is sincerely and deservedly regretted.

Although he was trained in PHILIP HARDWICK'S office, and his whole professional career was passed in London, he was a Yorkshireman by birth and the son of a clergyman. The social instinct was strong with him, and as early as 1851 he became a member of the Architectural Association. It was then a very different sort of body, for the development of it has been unprecedented, but the early members were expected to be earnest for the principle of mutual improvement, and there was no better example of loyalty than ROGER SMITH. Twice he was elected to the office of President. Even in those days it was evident he was adapted to be an instructor. It could be said of him as his most marked characteristic that "gladly would he learn and gladly teach." Throughout his life he was seeking knowledge, and tasks from which many would shrink were gone through cheerfully with that object. But he was careful to keep within prescribed limits. He never feigned to be encyclopædical except in respect of building. If there was any subject which was related to his business he endeavoured to master it thoroughly. Hence it was he went through the drudgery of preparing abstracts of specifications for building materials and building appliances for the Patent Office. He travelled through many parts of Europe in order to study buildings closely. The interest with which he followed all the details of an arbitration case in which he was engaged showed that the old spirit continued to be as strong as ever with him until the end.

The knowledge he acquired he was ready to impart. We suppose there was not one of his contemporaries who, while practising as an architect, read an equal number of papers upon architectural subjects. The composition of them, he realised, gave definiteness to his knowledge, and was therefore a beneficial exercise for himself. They were all characteristic of his aims, and the limitations he imposed on his studies. He admired MR. RUSKIN heartily, but at a time when so many young architects imagined they had caught the spirit of that able writer when they spoke of stonework as if it were jewellery, and revelled in allusions to sapphires, diamonds, topazes and so on, ROGER SMITH'S addresses were as direct as if they had been written in the early part of the nineteenth century, and were scientific rather than pseudo-poetic in their manner of dealing with construction. The author never attempted to magnify their merits, and we are surprised he did not bring them out as chapters of some large treatise. They

would still be adapted for that purpose, and are well deserving of being collected and united. A few of his articles were utilised for the volume of WEALE'S series on "Acoustics." It represents a large amount of labour, and yet he underrated its value, saying, "It has simply been framed with a wish to afford, in a somewhat connected form, as much information relative to the laws of sound, and their application to the arrangement of buildings, as could be collected from trustworthy sources." In a later edition it was made evident that he was not afraid to seek information by a consideration of the temporary buildings used for the MOODY and SANKEY services.

It was no doubt from his readiness to teach as well as to learn that in an embarrassing emergency he accepted the onerous responsibility of bringing out *The Architect* as editor in January 1869. He was busily occupied at the time with other duties, and he could have had no self-seeking in the ordinary sense of the word when he took up the office. As he said in his opening remarks, "The editor has no desire in the conduct of this Journal to intrude himself, his works, or his name on its readers." To that intention he was faithful. His articles were not signed; his own buildings were not introduced, and in no way did he arrogate power or superiority. It was a time when critics were assumed to have "as large a charter as the winds," and the editor did not attempt to evade the common lot of victims. In the Academy exhibition which was opened a few months after his assumption of office there was a drawing by him, and the following was the candid opinion expressed on it by EDWARD GODWIN:—"The drawing No. 1,016, 'Blythwood,' by Mr. T. ROGER SMITH, has its merits and demerits so balanced that it is difficult to say much about it. If Mr. SMITH thinks barge-boards, stepped gables and plain gables coped with wrought-iron tabling are mere fancies of the Middle Ages, and not the results of local conditions, then he acts up to his thought; but if, as I believe, these three features are all local peculiarities—the result of obedience to nature, our only governor—Mr. SMITH has something to unlearn." The editor who would tolerate such free speech about his want of acquaintance with the favourite style must have had a strong sense of justice, and it is doubtful whether a parallel to so much forbearance is to be found in the annals of journalism. His equanimity was tested in other ways. The friends and fellow-labourers on whom he relied had each his ideas about the duty of ROGER SMITH in undertaking such a venture. But all had a common belief in the necessity of incurring expensiveness. From the reproduction of the finest illuminated manuscripts in the British Museum to the production of working drawings on double-elephant size sheets, projects were brought forward which would have fluttered a Chancellor of the Exchequer. But the editor accepted all the advice with good-humour, and if the schemes could never be realised no one was offended with him. Another literary venture in which he took part was the editing, in association with the present President of the Royal Academy, of the "Illustrated Handbooks of Art: History of all Ages and Countries." A volume on Classic and Early Christian architecture by the Professor and Mr. JOHN SLATER appeared. The announced companion volume, "Gothic and Renaissance," of which the authors were to be the two editors of the series, remains unprinted.

ROGER SMITH had given so many proofs of competence to instruct, there was satisfaction when he was appointed in the place of Professor HAYTER LEWIS at University College, London. He carried on what seemed to be a tradition, for his predecessors, HOSKING, DONALDSON and LEWIS, were also practising architects rather than theorists. Students who attended his classes have always acknowledged the patience of ROGER SMITH, and his interest in those who were attentive and industrious. In support of the endeavours of those who tried to raise the character of building workmen by explanations of the principles and history of construction he gave efficient aid. Indeed, it could be said that even when exertion caused him suffering, he cheerfully lectured on subjects which he had mastered. His name should be remembered as one of the most zealous and useful educationists of our time. It was, for instance, somewhat of a sacrifice of dignity to serve as

the Italian rather than the Gothic style, but he was not one of those who saw little merit in the latter. At an early period of his career he prepared the designs for the Elphinstone College and the Post Office, Bombay, and had reason to anticipate many similar commissions; but civilian architects usually found, sooner or later, that architecture was an appanage of military engineers in India. Professor SMITH's buildings are of many classes—churches, schools, warehouses, mansions, hospitals, &c. Not long since we pointed out that in the Ben Jonson Board School he was the first to introduce a central hall as an essential element. Of late years he had Mr. A. J. GALE as partner, and then his son, Mr. ELSEY SMITH, now Professor of Architecture at King's College. Professor SMITH's experience qualified him to be an expert assessor, and his uprightness was a guarantee of fair play. No man could have a more delicate sense of professional honour even in trifles.

THE LATE PROFESSOR THOMAS ROGER SMITH.

examiner of the crude efforts of students in the building construction classes of the Science and Art Department, but in that way he was enabled to realise the deficiencies of those who were to become workmen and builders, if not architects. Whenever the opportunity arose, he was enabled from his experience to suggest the desired remedies.

An architect of Professor SMITH's rank could remove some of the objections to the administration of the Building Act, and his appointment in 1875 as district surveyor was hailed with satisfaction. Lambeth was not the most desirable region for commencing operations, but in the proceedings relating to Dr. LEE's church the Professor displayed his moderation. In 1882 he was transferred to West Wandsworth. He served as one of the examiners of candidates for the surveyorship, and if his life were prolonged it was certain he would become the representative of architecture on the Tribunal of Appeal.

From his training he could hardly fail to incline towards

Professor ROGER SMITH could be accepted as the type of the modern all-round architect, if such a phrase may be allowed. If he did not possess the highest genius, he had that capacity for taking pains which is often a substitute for it. He never posed as a grandee nor suggested in any way that the majority of practitioners were his inferiors. Whenever he exercised the critic's office he was most moderate in his objections to designs which he could not admire, and we have known him to find reasons to praise work which most judges would pass over. His wide acquaintance with the circumstances of professional life had taught him to be tolerant. Many years ago it was said of him that he could not make an enemy, and although like most men he was compelled to be strict at times, those with whom he had to deal recognised that his conduct was inspired solely by duty. Those who knew him longest will have the deepest regret for the loss of a man who was a credit to his profession, a good citizen and a faithful friend.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VII. (*continued*).

CLOSELY connected with the subject of variety and unity is the consideration of *contrast*. This is a valuable ingredient in design when used with proper care, and is, indeed, of the utmost importance for the production of

Monotony.

FIG. 53.

vigorous art. ARISTOTLE'S definition of harmony, just quoted, should be noted, but with an addendum as to the

Contrast.

FIG. 54.

use of contrast. The ancient architects were well versed in this, and used contrasting forms with the happiest effect. The Classic column with circular base and cap-moulds

and with circular shafts had a square die to the base and a square abacus to the capital; the entablature had equally effective variations. The curves of the mouldings, too, in the best work were not mono-central, and contra-flexured mouldings were also much favoured.

To crystallise the remarks that might be made at this place, consider such a setting of windows as shown in fig. 53. This confines within a small compass the treatment of a principle admitting of indefinite (or rather infinite) extension. The setting, as shown, is very anæmic, and would be improved by the use of a contrasting "heading," as shown in fig. 54. Other methods of obtaining contrast will readily suggest themselves.

In this place it will be suitable to offer some remarks on *disproportion* in buildings. Elevations admit of great variety of treatment, according as they are made to appear more or less broad or lofty; such *appearance* may be quite independent of actual dimensions, as the eye may be deceived by method of treatment. In the accompanying diagram (fig. 55) the optical tendency is to consider A of

FIG. 55.

less height than B, and it needs either a very correct eye, or else some useful scepticism, to feel *assured*, without taking measurements, as to the equality in height of the two blocks.

It is patent to spectators of Greek religious edifices that their creators favoured a latitudinal effect, which may be taken, at pleasure, as a symbol of their polytheistic creed; whilst the loftier and more contracted effect of Mediæval Gothic church work will, on the same lines, serve to symbolise the loftier and more restricted ideals of the Christian religion. It will not, however, do to strain the application of these symbolismisms, as people are wont to do, for the probability is that merely accidental causes are responsible, amongst which methods of construction take a prominent position.

That very sensitive and fine organ—the eye—is capable of being deceived by the simplest expedients. If it can manage to see objects awry, it will do so in eight cases out of ten; in the *two* cases, the lucky possessors vaunt themselves on having a "very correct eye." It would be difficult to find anyone envious of POLYPHEMUS, but doubtless he was less afflicted with optical illusions than are most people.

It may be frequently noted, and more especially amongst artists, that one eye is closed on occasions when correct perception of an object is desired.

In an earlier chapter, remarks have been made as to the artistic means of correction for optical illusions, and reference is also made to the extracts from VITRUVIUS (given in *Appendix B*). Of course, it is finally an optical illusion that makes the *corrective* measures *seem* correct.

Disproportion is of rare occurrence (comparatively, be it understood) in the domestic work that falls to the lot of the average architect to design. In public buildings, however, and in palatial mansions as well as the American "skyscrapers," the point should receive due consideration. The undesired effects can be modified to a nicety, according as more or less contrast is given. As VITRUVIUS notes in the course of his writings, some results are obtained by genius only, learning being useless for the purpose; so it is under these circumstances, and it is impossible to give exact directions for the correction of ill-effects—each case must be treated on its merits.

One example brought to memory is a building that, in design, proved difficult of treatment, as it was necessarily

(from various causes) long and low—too low for dignity, and impossible (for reasons of economy) to make as high as desired; however, by the judicious use of breaks and

arcading, so as to obtain a greater proportion of vertical lines, and by appropriating a few feet extra height of walling than the rooms really justified, a tolerable result was achieved. In general terms a latitudinal effect is restful in appearance, a lofty one, fatiguing, due to the fact that the eye can travel more comfortably along its own level than *solo usque ad cælum*.

The repetition of ornament in a latitudinal direction, though tending to emphasise the breadth, is not necessarily restful in appearance; nor does the repetition of vertical features necessarily prove wearisome to the eye. In the former case so much monotony may be introduced as to cause fatigue; and in the latter case the repetition of vertical features latitudinally will naturally tend to carry the eye in that direction, and thus may counteract what might otherwise prove a distracting effect.

Chimney-stacks multiplied indefinitely (or to a large extent) are very disturbing influences, even when of the picturesque type made familiar by WOLSEY'S Palace at Hampton Court (see fig. 56). To conclude this chapter some illustrations are given of gable treatment, this being a feature that lends itself readily to the demands of unity, variety and contrast (fig. 57).

(To be continued.)

FIG. 56.—CHIMNEY STACK, HAMPTON COURT.

FIRE PROTECTION AND LEGISLATION.

BUNSEN, the historian, relates how, once in Rome he was present at the burning of a building which caused much excitement among the populace. The crowd shouted and gesticulated, but nobody dared to meddle with the flames, which, in consequence, extended until everything was consumed. The cry was *Tocca al governo*, or, in other words, it is the business of the State, not of the people. In Rome the government was of the old-fashioned paternal sort, and was expected to devote some attention to

FIG. 57.

fires, or rather, out of pity, to give compensation to sufferers. But in other countries for accidents of the kind, however serious, there was no responsibility accepted by the State. The indirect character of the Acts of Parliament relating to protection from fire in this country is enough to suggest that as fires are supposed to owe their origin to the carelessness of individuals, it is not the duty of public authorities to provide remedies against the results. It is now beginning to be perceived that such *laissez-faire* policy is not universally applicable. There is a possibility of a reaction, which from its comprehensiveness may do as much harm as good. When we find it is contemplated in New York to make regulations about the use of matches in houses, and children are to be liable to punishment for interfering with them, we may conclude that panics are not far off, and the remedy may become as undesirable as the evil.

The Society of Arts, that generally affords means for indicating the state of public opinion on many matters, at last week's meeting was occupied with a consideration of the "Existing Laws, By-laws and Regulations relating to Protection from Fire, with Criticisms and Suggestions." The Fothergill Prizes had been offered for essays on the subject, and the three which were successful were read at the meeting. The first prize was awarded to Mr. T. BRICE PHILLIPS, sanitary inspector to the Uckfield Urban Council. His success is enough to show that the interest in the question is not confined to cities, but has made its way to the smaller towns and country districts.

We have said that the statutes relating to the subject were of an indirect character. This is evident from a glance at the list given by Mr. PHILLIPS. The Acts treat of lighting and watching, waterworks, town police, Poor Law amendment, petroleum, public health, local government, factories and workshops. In only two instances is the connection with fire apparent. One is the False Alarms of Fire Act, the other the Parish Fire-engines Act. It is claimed, however, that by fourteen statutes local authorities are invested with power to provide out of public funds the necessary appliances for protection from fire, to exercise control over the erection of new buildings, as well as power to secure that such buildings are erected in a substantial manner, and that incombustible materials are used as far as is practicable. In spite of the Acts everyone acquainted with English towns is aware that in many of them the extinction of fires depends on the efforts of amateur or voluntary fire brigades. At the same time we believe with Mr. PHILLIPS that the latest Acts indicate a sure though gradual tendency to place upon local authorities more onerous duties in the matter of protection from fire. That circumstance is further shown by the increase in the amount of loans received by local authorities for fire-engines and other appliances (including fire-stations), which has varied from 29,311*l.* in 1884-85 to 161,517*l.* in 1899-1900. The outstanding loans of the local authorities under the same head show a progressive increase from 308,508*l.* in 1884-85 to 1,014,679*l.* in 1899-00.

There are also some local enactments in which the vagueness of the general statutes is amended and a definite applicability is substituted. Liverpool, for example, possesses Acts which deserve to be followed in other places. They relate to the construction of warehouses, the registration of warehousemen and porters, &c. There is one important Act by means of which all extraordinary expenses of the fire brigade incurred at fires have to be paid by the insurance companies who have issued policies covering the property attacked, and by the proprietors of uninsured property attacked. A special Act, known as the Factory and Workshop Act, which was intended to be a model in its way, has to some extent become inoperative owing to its resemblance to the old statutes, for the County Council of London discovered that an authority cannot legally insist on the construction of staircases in buildings which are subdivided. A somewhat similar obstacle arises to the operations of the Public Health Act of 1875. Urban authorities are empowered, as Mr. PHILLIPS says, to make by-laws with respect to the structure of walls, foundations, roofs and chimneys only, and this limitation precludes any further preventive measures being enforced in upper storeys. If the increasing risk from fire in the higher parts of buildings had been kept distinct from the

question of stability, it is probable that the necessity of making by-laws for the inner constructive details of upper storeys of buildings would have become more apparent, and that some minor risks, now entirely unprovided against, would have been minimised. The object of the Public Health Act is said to be the securing of stability, the prevention of fires, besides "purposes of health." Stability is obtained by ordering greater thickness for the lower walls of a building, but as there is most danger when fires break out in the upper parts, the regulation would in reason require to be reversed. Then, again, whenever incombustible materials are prescribed for use, a perfection that is almost unattainable is supposed to be within reach. Flammability seems to be a universal property. The defects in the language of the statutes relating to fire prevention reveal how little attention was given to the subject when they were passed. But as long as they remain un-amended the Acts must be respected in the courts.

It is, of course, difficult for any individual to outline a scheme of legislation which will secure greater efficiency in the prevention of fires than is now possible. Mr. PHILLIPS prudently suggests a number of subjects which should be taken into account by authorities. He advocates, in the first place, a general inquiry into fire-preventive laws, as distinct from laws as to fire extinction, and as to any modification required in the powers given to local authorities to make by-laws for the prevention of fire in buildings. Among the questions which could be taken up are the desirability of making laws and by-laws retrospective when they relate to protection from fire, the appointment of fire inspectors, the conveyance, storage and sale of inflammable goods, lamp accidents, protection from fire of theatres and places of public resort, the obtaining of contributions from insurance companies and owners towards the expenses of protecting buildings and property, the creation of a public fire department to supervise the administration of fire laws, with such subsidiary questions as the position of volunteer fire brigades, foreign measures for protection, the training of children how to act in panics and outbreaks of fire, &c. Here we have an array of projects that is enough to scare legislators who now profess to be harassed by an excess of labour.

It is a misfortune that people are disposed to undervalue the losses which arise by fire in this country. It will sometimes happen that towns and districts of cities may have enjoyed an immunity from conflagrations during several years. It is therefore concluded that with ordinary care fires are an impossibility. But when we find that during the five years, 1898-1902, the average losses in less than fifty companies amounted to 11,949,969*l.* a year, and that the average yearly expenses were 6,763,162*l.*, it becomes evident what great financial interests are at stake. There are people who consider that destruction is an advantage, like the good uncle of whom J. B. SAY, the French economist, speaks, whose practice it was to break the drinking-glasses after a meal, believing that it was only fair he should afford other men a means of living. That is a very narrow view of sociology. It is a confounding of the general with the particular. Because a fire may bring a profit to a few, the misery which arises to others is obscured and neglected.

It must be allowed, however, that the methods of calculation adopted in the determining of premiums is not favourable to the production of one means of aiding in the prevention of fires, viz., sound construction. It is no doubt for the convenience of insurance societies that a system of average rates should be accepted, and the amount charged in most cases is, if compared with the risks incurred, remarkably moderate. But property owners cannot help coming to the conclusion that a man who builds a flimsy house is wiser in his generation than the man who employs only the best materials, for while there may be an enormous discrepancy between the outlay in both instances the two are treated on the same terms in the tables of most insurance companies. An accident may arise as easily in one house as in the other, and taking all things into account the advantages seem to be in favour of the man who patronises flimsiness to as large an extent as by-laws will admit. It is that sense of seeming unfairness which is at the bottom of general indifference to security against fire. The remedy for it is not easily discovered.

No system of insurance, although it may be supposed to be derived from that in use for ships at Lloyd's, has yet been devised which will meet all the inequalities of construction, and yet all experts know that the influence of insurance is so vast, it must be reckoned as the principal factor in the majority of measures for coping with fires.

MANCHESTER SOCIETY OF ARCHITECTS.

THE sessional meeting was held on the 12th inst. The prizes were distributed by the president, Mr. Alfred Darbyshire, to the students who had been successful in the various competitions of the past year.

The names of the winners of the last competitions were announced as follows:—For the design for the cover of the new sketch book, Mr. J. Harold Gibbons; Mr. Holden's prize for a design for a free library, Mr. Harry Moss; the monthly class of design for a market hall, Mr. Harold Hill and Mr. C. H. Potter, bracketed equal.

A paper was then read by Mr. Isaac Taylor on the students' work of the past year. The drawings, some sixty in number, were hung round the room. Mr. Taylor congratulated the Society on the excellent work to be seen in the room, and urged students who did not at present enter into these competitions to give their attention to them in future. The Society gives about 40*l.* a year in prizes to be spent in books, so that, besides the useful training, here was an excellent opportunity of establishing a first-class library. A further prize of 5*l.* 5*s.* was this year offered by Mr. J. W. Beaumont for sketches and measured drawings suitable for publication in the sketch book, which it was hoped to make a first-class publication.

Turning to the sketches exhibited Mr. Taylor, whilst realising the value of artistic sketching, thought that an architect's sketch book should have far more outline diagrams, with sketches to large scale, of details and mouldings. There should be less of the photograph-like general views that students were so fond of making. The importance of measured work was also insisted on.

The lecturer then gave a short criticism on each of the drawings.

Mr. J. W. Beaumont, in proposing a vote of thanks, spoke of his great interest in the forthcoming issue of the sketch book, and pointed out that it rested with the students to make it successful.

Mr. H. B. Laycock thought that some of the conditions for the competitions should be more explicit, instancing the cottage hospital, where it was not stated whether day-rooms, operating-room or accident ward were to be provided.

Mr. Salomons also spoke, and the lecturer briefly responded.

CORONATION STANDS.

AT the Southwark County Court, London, on Monday, his Honour Judge Addison, K.C., concluded the hearing of a remitted action in which Mr. H. D. Earl Earl, an architect, of Worthing, sued Messrs. Pattenden & Co., sack and bag makers, of Bermondsey Street, S.E., to recover 50 guineas, balance of a sum of 200 guineas, fees for work done as architect for the defendants, under a contract for the erection of a stand in the churchyard of St. Clement Danes Church, Strand, for the Coronation procession. The defendants counterclaimed the sum of 65*l.* 10*s.*, being 15*l.* 10*s.*, fees paid for plans which it was alleged were wholly useless, and 50*l.* for loss sustained through the plaintiff's alleged negligence.

The plaintiff's case was, says the *Sussex Daily News*, that when Mr. Pattenden hired the churchyard on which to erect a stand he, as the result of an introduction by the Vicar, submitted plans for the erection which he had prepared beforehand. They were seen by Mr. Pattenden and his builder and accepted, and a contract was entered into to pay him 200 guineas for his services as architect, and 5 per cent. on the net profits of the letting of the seats. The plans were submitted to the Westminster Corporation, who approved them, and the work was proceeded with. The builder, however, during its progress made alterations, with the result that the rake of the tiers was considerably varied, and the number of seats was lessened, while another 200 seats were done away with by Mr. Pattenden insisting on the provision of intersecting gangways, which were unnecessary. He complained to Mr. Pattenden of the action of the builder, but all he could get from the defendant was that he (defendant) was practically in the hands of the builder through want of money, and he (plaintiff) must get the best he could out of him. Had the stand been erected according to his plans and specifications, the full number of seats could have been provided, and every occupant would have been able to have got a good view of the procession. The defendant insured against the procession not taking place, a contingency that actually occurred, and he was

paid 6,000*l.* by the insurance company, but he refused to pay the 50 guineas owing to him (plaintiff).

The plaintiff was corroborated by two district surveyors as to the practicability of his plans, and as to the uselessness of intersecting gangways.

Mr. Pattenden indignantly repudiated the suggestion that he was in the hands of the builder, and emphatically denied that the plaintiff ever complained of the builder's work or action. The gangways were absolutely necessary, and their inclusion meant a loss of 200 seats, which represented 800*l.*, taking an average price, a matter he had not bargained for when fixing the price of the seats. When the stand had been erected he (defendant) discovered that a large number of seats did not command a view of the centre of the roadway, while rows had been left out. The plaintiff put it down to the bungling of the builder, but witness pointed out that the man could not have deviated from the plans if he (plaintiff) had looked properly after the job. After the procession had been abandoned the plaintiff practically promised not to say anything about the remaining 50 guineas.

Thomas Elkington, the builder, and his foreman declared that all the alterations made were carried out after consultation with the plaintiff and with his consent, and they proved a great improvement in his original plans, although they did not entirely overcome all the defects.

Two architects gave evidence to the effect that a large number of the seats as shown on the plaintiff's plans did not command a view of the centre of the roadway.

Another witness declared that when he remarked about not being able to see the road from certain seats, the plaintiff said he had made a mistake in his plans and was worried to death, while he had not had any sleep for a fortnight through it.

After a long hearing, which occupied two whole days, his Honour said he was convinced that Mr. Earl was a very competent architect and thoroughly understood his business, but by some unfortunate mistake his plans were such that when the stand was erected, even after alterations approved by him, there were many seats which did not command a view of the roadway along which the procession would have passed. That was a most serious defect in the plans, and he considered in view of that, that the amount the plaintiff had received was sufficient. As to the counter-claim, he would strike that out and not go into the reasons for doing so. He therefore gave judgment for the defendants on the claim, with costs, and with the consent of the defendants struck out the counter-claim. Judgment was entered accordingly.

HAMPTON COURT PALACE.

IN consequence of the recent malicious damage done to the valuable tapestries in the Great Hall at Hampton Court Palace, the origin of which has not yet been traced, His Majesty's Office of Works has ordered several of the State rooms which are not immediately under the control of the officials to be closed. These rooms are the small chambers leading out of the Great Hall, where the tapestries were cut; the Prince of Wales's drawing-room, Cardinal Wolsey's closet, and another apartment in the Tapestry Gallery. These apartments are so situated that it is impossible for the attendants to exercise proper supervision over them without withdrawing themselves from other rooms under their care, and it has been thought advisable to close them for the present until the staff of attendants has been increased, a course which His Majesty's Office of Works, it is understood, have now under consideration. The decision is regarded as a wise one, as each of the rooms in question contains paintings and tapestries of almost priceless value, Cardinal Wolsey's closet containing the only painting of the famous cardinal in the Palace.

LIVERPOOL ARCHITECTURAL SOCIETY.

A MEETING of the Liverpool Architectural Society was held on Monday evening in the lecture-room of the Incorporated Law Society's offices under the presidency of Mr. Thicknesse. An interesting paper on "Ancient Churches of Wirral" was read by Mr. Laurence Hobson, who pointed out that one of the characteristics of the Wirral churches was their massive square towers. The quaintest church in this particular district was that dedicated to the Holy Cross at Woodchurch, the site of which probably once contained a wooden edifice; the most picturesque in its situation was tae Shotwick church; while from an architectural point of view St. Andrew's, Lower Bebington, was imbued with the greatest interest. At West Kirby it was likely that the church existed in Saxon times, while the Neston Church tower probably belonged to the early part of the fifteenth century. The paper, which was listened to with great attention, was excellently illustrated by limelight views, and at the conclusion a hearty vote of thanks was accorded to Mr. Hobson.

NOTES AND COMMENTS.

It is satisfactory to know that international enmities do not become an obstacle to archaeological researches. Since 1768 Corsica is French territory, but notwithstanding, the island is about to be the scene of explorations by Germans under the direction of Dr. WILHELM VON LANDAU. The island was known in antiquity, and was a settlement of the Phocæans. By the Romans it was employed as a penal settlement, for the climate was supposed to be equally fatal in summer and winter. It is evident, however, there were inhabitants in Corsica at a far remote period, for one of the objects which has inspired the German expedition is the prehistoric dolmen near Bastia, which has already yielded many flint implements. There are, too, Roman remains which deserve more careful examination than they have hitherto received. The island was occupied by Iberians and Phœnicians, and information about the latter, although abundant, could well be supplemented by evidence which it is expected will be forthcoming. Altogether much may be anticipated from German investigations, and it is creditable to the French that they have given the opportunity to their rivals to utilise so promising a region.

It may not be generally known that photography is now utilised for reproductions of the oldest manuscripts for the especial advantage of philologists and palæographers who are doubtful about the fidelity of versions which have been issued from the most renowned printing presses. M. SIJTHOFF, of Leyden, has distinguished himself by his copies of the Codex Sarravianus-Colbertinus, the Codex Oxoniensis Clarkianus, the Heidelberg "Plautus," the Venetian "Homer" and the Florentine "Tacitus." They are only parts of the texts which will be comprised in the great undertaking, "Codices Græci et Latini Photographice Depicti," which is in course of publication under the direction of the scholarly librarian of Leyden, Dr. SCATO DE VRIES. The "Terence" which is about to appear will not only present the text of the manuscript in the Ambrosian Library of Milan, but also other versions. The comedies, being limited in number, are well adapted to exemplify the variations which were introduced by copyists from time to time in ancient works, although all professed, like St. AUBIN's translation, to be "rendues tres-honnêtes en y changeant fort peu de chose." Among the authors whose works it is contemplated to reproduce we do not find any mention of VITRUVIUS. It is true the Oxford manuscript dates only from the beginning of the fourteenth century, but it is believed there is one in Spain, and it may be others elsewhere.

THE report of the directors of the Builders' Accident Insurance, Ltd., for the past year states that the company during that period received notice of 1,037 accidents. There is a slight reduction on the premium income owing to the directors declining to renew some heavy risks which were found to be unremunerative. The new business has exceeded that of the previous twelve months by nearly 25 per cent. The assets of the company amount to 28,432*l.* 2*s.* 8*d.*, of which 26,789*l.* 14*s.* is represented by investments in Consols and the following stocks:—Metropolitan Consolidated, Liverpool Corporation, West Middlesex Waterworks Company, Eastern Telegraph Company, Great Eastern Railway Company, India, and London County Council. The claims have been 10,340*l.* 4*s.* 7*d.* The company is in a satisfactory condition and is well able to meet any demands which may be made upon its funds.

THE name of M. LÉON-JEAN ROUX is not familiar to students of French architecture as the designer of important buildings; but he must somehow have been able to acquire wealth, for it is said he has bequeathed to the Académie des Beaux-Arts a sum of 800,000 francs, or over 30,000*l.* of English money. Such a gift is unprecedented. The income is to be applied to the creation of annual prizes in painting, sculpture, architecture, miniatures and illuminations, which will commemorate the names DESTOUCHES, DELARGE and ROUX. The academy already possesses several funds for similar purposes, but the capital in each case was inferior to the amount bequeathed by M. ROUX.

NEW SCHOOL, OAKBANK, FOR THE KIRKNEWTON AND EAST
CALDER SCHOOL BOARD.

ST. COLUMBA CHURCH, BLACKHALL.

THIS new Established church is about to be erected on a prominent corner site on the Queensferry Road. It is designed in the Norman style, the exterior being very simply treated in a manner characteristic of Scottish Mediæval work. The main entrance is in the tower, which is large and square on plan, and is finished with an octagonal stone spirelet. The plan consists of a nave, with a semicircular apse and two side aisles, one of which contains a gallery. Part of the north aisle is increased in width to form a chapel with an apsidal termination. The semicircular domes of the apses, which form important features of the interior, it is proposed to richly decorate with mosaic or fresco. The rest of the interior will be finished in stone; the roof will be open to the ridge. The church will accommodate 900 persons. The halls and offices are grouped at the east end of the church around a garth. The large hall accommodates 345 persons.

The total cost will be between 7,000*l.* and 8,000*l.* The architect is Mr. P. MACGREGOR CHALMERS, I.A., of Glasgow. The drawing illustrating this church is by Mr. J. JEFFREY WADDELL.

DESIGN FOR A COUNTRY RESIDENCE.

PICTURESQUE IPSWICH.

IPSWICH is full of historical and topographical interest to the antiquarian. It contains a larger number of old mansions than perhaps any other town of similar magnitude in the kingdom. Much of Ipswich was built in the fifteenth and sixteenth centuries, and several buildings of that period are still standing, proving their antiquity by their Tudor red-brick mouldings and their panelled interiors. The town was surrounded by a wall and ditch, and protected by a castle, not a vestige of which now remains. The very site is a matter of uncertainty. Although the castle is gone, many rich architectural treasures remain, and the most distinguished of these is the house of Mr. SPARROWE, situated in the Old Butter Market. It was built for one GEORGE COPPING in 1567, and was sold by him to the SPARROWE family, in whose possession it has remained. The house is a unique specimen of "pargetting," or plastering. The whole of the exterior is profusely ornamented with plaster reliefs of animals, fruits and flowers. The interior contains several fine rooms rich with carving, inlaid doors, Tudor mantlepieces, carved beams, great fireplaces with chimney corners, &c. On the first floor a room extends over the whole of the front part of the house. In this richly decorated apartment hang many old paintings. In 1801 discovery was accidentally made of a fine old loft, which proved to have once been the roof of the oratory in Catholic times. According to a tradition in the SPARROWE family CHARLES II. lay hid here after the battle of Worcester. A portrait of CHARLES by VANDYKE hangs in the great room and among others by great masters is one by GAINSBOROUGH of JOHN SPARROWE, thirteen times mayor of Ipswich. Another interesting mansion is that of Christchurch. Erected originally in the third year of EDWARD VI., it has the usual characteristics of the Tudor style—built of brick, richly moulded and standing on three sides of a court. It is situated in a park of great beauty, and in this park is a bowling-green where CHARLES II. once played a game when on a visit to Viscount HEREFORD, the then owner of the estate.

As the visitor proceeds down College Street he comes upon the noble gateway known as Wolsey's Gate. The great Cardinal was a native of Ipswich. This was one of the many entrances to his college, probably a building of great magnificence, in accordance with the taste in architecture which this prelate possessed. Over the doorway are the arms of HENRY VIII. The date of this doorway was probably that of the erection of the college, 1528. The old town abounds in interesting historical curiosities, ancient inns, fine churches, in which lie many monumental brasses, and, as a specimen of obsolete methods of correction, the old ducking-stool is still to be seen with its companion, the stocks.

INSTITUTE OF BRITISH ARCHITECTS.

MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., President, in the chair.

The Late Professor T. R. Smith.

THE PRESIDENT said he regretted it was his melancholy duty to announce the death of another very distinguished member of their body, Professor T. Roger Smith, who had been present that day. They all knew him very well and they loved him very much. He was elected an Associate in 1863, and it was not too much to say that a member of the Institute from that time took a more active part in the work that they had carried out. He was a student of architecture and a very learned and modest man.

His practice took many forms, and various branches of it engaged his attention, but whatever he did he did with intelligence. He had held nearly all the posts in the Institute, and was district surveyor for West Wandswoth. He was besides the author of several works in reference to architecture, and many of the younger members of the profession had passed through his hands as professor of architecture at the London University. In conclusion, the President gave a vote of condolence and sympathy with the relatives of the deceased.

The vote was passed in silence.

Mr. CHARLES HADFIELD read a paper entitled

Westminster Cathedral.

He stated that the idea of erecting a cathedral for the diocese of Westminster originated with Cardinal Wiseman some months before his death in February 1865. The project was taken earnestly in hand by his successor, Cardinal Manning, and in 1884 the present cathedral site, consisting of four acres, upon a portion of which had previously stood the Tothill Fields Prison, was acquired for a sum of £100,000. Cardinal Manning died in January 1892, leaving the duty of raising the edifice to his successor, Cardinal Vaughan.

The idea of erecting a great basilican church, an attempt to reproduce old St. Peter's, was abandoned as impracticable, with it the competitive system of getting a design. In 1894 Mr. J. F. Bentley, who had expressly declined to take part in any competition for the building, was asked to take the designing of the cathedral and consented. Prior to beginning the work he spent some time in Rome, and visited St. Mark's, Venice, and the group of churches on the Venetian coast which had been influenced by the Sta Sophia at Constantinople. He admitted that the buildings at Ravenna first led him to decide on the forms and treatment of what was to be in his mind. On returning to London in March 1895 he rapidly prepared the plan, with an internal area of 54,848 square feet, of a great Byzantine cathedral which, in the general lines of the design, had been long maturing in his mind. Later, a model was prepared, one forty-eighth the size, executed in Kauri pine. The foundation-stone—a Cornish granite 5 feet by 3 feet and 2 feet 8 inches—was laid on June 29, 1895. The Byzantine, instead of the Gothic style, had been decided on after much deliberation. The question of cost weighed heavily against a Gothic design. Modern appliances a Byzantine cathedral of brick would cost within three or four years with the means at command, leaving the marble and mosaic decorations to be added later, and the necessary funds were available.

They himself fully concurred in the decision. "I am not attempting a new style," he said, "that is impossible; but, as far as I am able, to develop the first phase of Christian architecture." His plan of the cathedral, Bentley maintained, was not that of the eastern church of the Justinian era, but an example of what might have been unfolded had the decadence of the Roman Empire terminated the growth of congregational requirements in the East. The plans of St. Peter's and St. Basil's, Constantinople, or of St. Vitale, at Ravenna, both of about the same age, it was evident were suggested from a liturgical rather than a congregational standpoint, while the church of St. Mark, Venice, erected by four centuries later, indicates a marked advance in the direction, showing clearly the course the development was taking.

The church is not orientated, the axis of the choir being directed to the south-south-east. This was demanded by the necessities of site and surroundings, and by considerations of lighting, &c. It was, moreover, in accordance with an ancient precedent where churches had to follow the lines of the streets and ways. An important factor in deciding the site and the foundations, crypt, &c., was the existence of a platform of concrete 9 feet thick, the foundations of the Tothill Fields Prison, which underlies a portion of the site in a diagonal line drawn from the north jamb of the great entrance portal to the south pier of the sanctuary arch.

Externally the cathedral has an extreme length of 360 feet and a width of 156 feet; the height of the nave being 117 feet, height of the façade (not including the turrets) 99 feet, height of the campanile 284 feet. Internally the dimensions are:—From the main entrance to the sanctuary, 232 feet; depth of the sanctuary, 65 feet, and of the raised choir beyond, 45 feet, making a total internal length of 342 feet; width of nave, 60 feet; width across the nave and aisles, 98 feet; and across the nave, aisles and side chapels, 148 feet; height of the main arches of the nave, 90 feet; and to the crown of the domes, 112 feet.

The architect's leading constructive idea has resulted in a great building of brickwork, set in cement mortar, covered by homogeneous concrete domes, vaults and flats, &c., without recourse to the use of steel or ironwork, and with a sparing use of oak timber in the roofs of the apsidal choir and the transepts, and of teak in the upper stage of the campanile, with a provision for the gradual completion of the interior by lining it with marble up to a height of 40 feet, and above that with decoration of mosaicwork.

Mr. Hadfield gave details of the materials used and particulars of the exhaustive series of tests to which samples of bricks and concrete were subjected by the architect prior to their selection in bulk for the work. The cement selected was "the best Goliath brand," and ground so fine that the residue on a sieve of 5,800 meshes to the square inch would not exceed 10 per cent. The brickwork of the footings was double the width of the walls above, the concrete below extending from 1 foot to 2 feet outside. Faversham stocks were used for the lining of the interior behind the future marble and mosaicwork, thin Bracknell red facings (under 2 inches thick) for the exterior, Fletton wire-cut bricks for the large piers, and the walls, Poole wire-cut bricks for the smaller piers, and hard vitrified blue Staffordshire bricks for the outside facing of the underground vaults and sacristy, and for the damp courses, set in nearly neat cement. No machine bricks have been used. English bond was adopted generally, the outer facing excepted. For internal facing stock bricks were used, being best adapted for adherence when coated with the bedding for decorative work. Portland stone from the Brown bed was selected for the external dressings; and a high plinth of fine-axed Penryn granite, in courses, set with a bold open joint, was placed at the ground level to resist the injury from traffic. Granite has been used for doorways and elsewhere with the same intent.

As regards the domical construction, the architect's idea had been at first to save much centring by using cast segments of a sphere and building them up into domes; but he afterwards abandoned this method for that of a homogeneous mass of concrete thrown on to a centring. The sanctuary dome alone is pierced, and there are twelve windows encircling it, with an ingenious system of counterforts flanking each opening. The marble monolithic columns are an important portion of the general scheme of colour decoration in the cathedral. Great care, skilful research and a large outlay have been incurred in procuring them. They have been presented by many benefactors. In St. Peter's crypt round the apex below the retro-choir they are of red Norwegian granite, with varied capitals of Hopton wood marble and Derbyshire marble bases. The columns on either hand of the nave, twenty-nine in number, are of verde antico from the Classical quarries lately reopened at Larissa in Thessaly; Greek cippolino from the island of Eubœa; Swiss cippolino from Saillon in the Rhône Valley, Languedoc; Italian breccia from Seravazza; grey granite from Norway, and the red granite which is not unlike ancient porphyry. These shafts, 13 feet long, each stand on a moulded base of Norwegian granite. The columns dividing the aisles of the Blessed Sacrament and lady-chapels from the sanctuary are of jasper and red Norwegian marble of lovely colour and figure. There are fourteen columns of pavonazzo in the sanctuary galleries.

The columns have delicately sculptured statuary capitals of Carrara marble, each varying in design, and were fixed in position after the main arches carrying the domes were completed and the superincumbent weight had taken its proper bearings. The baldachino above the high altar, on the design of which Bentley bestowed much care, will be constructed of statuary inlaid with mosaic, and it will be supported by eight superb monoliths of onyx 15 feet in length, procured from Africa after long search and inquiry.

Cast lead is used throughout, and the roofing and ridges are wrought with welshed rolls, while the finials have the individuality inseparable from Bentley's work. The windows are glazed with roundels and white translucent glass, with strong pattern leading. The steps of the circular newel staircases which give access to the crypt, galleries and roofs are made of hard artificial stone, composed of Portland cement and crushed granite. The outer covering slabs of the domes are of the same material. The flats and gutters about the domes and roofs are laid with asphalt. In the large windows Doulton terra-cotta tracery or lattices of a varied and piquant design have been made use of.

The heating is by hot air on Haden's system, to be supplemented by low-pressure steam-pipes in the galleries. Two

spacious heating chambers are provided in the basements of the Blessed Sacrament chapel and of the baptistery.

In treating of the design of the interior and exterior special attention was called to the arrangement of the nave arcading—a favourite feature with Bentley, consisting of the continuous treatment of the arcading along the full length of the nave to the sanctuary arch, without ignoring the crux arrangement of the transepts, which are thereby invested with increase of interest and mystery. This contributes to the perspective and proportion of the interior in a marked degree. The architect has also scored a success in the lighting. The tympanum of each of the main arches is pierced by a semicircular lunette of 25 feet diameter, fitted with delicate tracery, and below, between well-defined pilasters, a pair of windows is devised. The lighting is further happily emphasised by the twelve windows round the sanctuary dome. The perspective of the interior has obviously been focussed on the high altar and its covering, the baldachino, the supreme spot of sacrificial interest. Each bay of the nave holds in its lateral face the mystical number of seven arches, four on the ground level carrying the galleries, each 12 feet span, two secondary arches of 25 feet span, and the great archivolt “embracing and unifying the whole system.”

The principal or western entrance from the exterior flanked by the campanile, a composition extending 65 feet, and embracing in the great arch three doorways—the outer for the laity and the middle for the cardinal, archbishop and clergy—leads into porches attached to a spacious narthex the entire width of the church, terminating at one end with an entrance from the side street, and with the baptistery at the other.

The narthex gives access to the nave, 60 feet wide, divided into three bays of 67 feet each, covered with domes rising out of pendentives. The aisles, 15 feet wide, are separated from the nave by marble columns supporting a continuous groined arcade. From the easternmost bays of the nave transepts of unique and interesting design project with additional entrances. Two larger chapels open right and left out of the transepts, with side aisles giving access to the sanctuary and to the sacristies.

Over the sanctuary will be suspended a gilded and decorated wooden crucifix, 30 feet high, with paintings of Christ, the four evangelists and the “Mater Dolorosa”—this will be the dominant note of the whole interior. The baldachino, flanked by eight monolithic columns resting on pedestals taking a semicircular form, bears a marble canopy. The high altar is a solid block of Cornish granite, fine-axed over, 12 feet by 4 feet. On the left side is the marble archiepiscopal throne on its own dais, modelled after the ancient one in the Lateran basilica. The pulpit has been executed in Rome and is of marble, decorated with mosaics.

As regards decoration, two only of the side chapels are in a forward state of progress. In the chapel of SS. Gregory and Augustine the altar and marblework are completed and the mosaicwork is proceeding, while in the opposite chapel, that of All Souls, on the north side of the nave, the altar, with its reredos and pictures in *opus sectile*, is completed, and the finishing touches are being put to the mosaics of the vault and arches, which are from the cartoons of Mr. W. C. Symons.

Having described various works in hand or contemplated, the author drew attention to the working part of the cathedral—the sacristies, strong-room, stores, registry, &c. Working drawings of a marble flooring of great beauty and originality had been completed by the architect, a portion of which only is to be carried out.

The most striking feature of the building is the west front, with its deeply recessed entrance arch of 40 feet span enclosing the tympanum, which is to be filled with a mosaic picture. The entrance arch is 4 feet wider in its span than that of St. Mark's at Venice, and is planned in receding orders supported on columns whose entablature is carried across the entrance and beneath the three doorways, the doors for which are executed in teak, to be covered eventually with bronze plates. The upper portions of the front terminate again with domed turrets, and are flanked to the north by the campanile set back from the upper portion of the front. The latter has a delicate entasis. The upper portion is gathered from the square to an octagon crowned by a teak-framed cupola covered with lead, and terminates in the bronze archiepiscopal cross some 10 feet in height.

Mr. Hadfield concluded with a reference to the death of the architect. He had seen him the previous day at his office in the Adelphi, standing bravely at his drawing-table, and found him full of enthusiasm about the cathedral's progress. He showed him then the drawings of the great crucifix and the marble pavements. They were to spend the next day together at his home at Clapham Common; but in the evening Bentley had a paralytic seizure, and passed away in the early hours of the following morning.

Professor BERESFORD PITE, who proposed a vote of thanks for the paper, said the author had placed before them the last work of a beautiful and interesting life. Those of the pro-

fession who took heed of the progress of their art, had discerned that there was arising in their midst the work of a great powerful man. That the late Mr. Bentley was entitled to a tribute was evident since he had carried out a work in which there was not the slightest trace of the influence of the Victorian age in which he lived. How far the style of the work was justifiable was not for them to say; they must acknowledge the genius and be proud and thankful to those who brought about the completion. The ability of the architect was unknown to them, for Mr. Bentley's work as a Gothic architect had had mention in Mr. Eastlake's history of the Gothic revival. The extraordinary church at Watford showed that who had a grasp of Gothic forms and Gothic work, the cathedral at Westminster was a far cry from the church at Watford. In the work at Westminster the influence of the Gothic revival suddenly disappeared, and they found the architect had flung himself into Ravenna, of all places, for the imitation of a London cathedral. This change in his work and laying aside of tradition was a source of wonderment to those of to-day, and would be to others in later years. The style was original and without precedent, but characteristic of the age, because it proved that they could work without tradition. In conclusion, the speaker said the thought that would be pre-eminent in the minds of all intelligent architects and artistic persons was that the cathedral at Westminster was the work of a great man and the embodiment of a grand scheme.

MR. ALFRED EAST, A.R.A., seconded the vote, supported by Mr. W. J. MILLARD.

The PRESIDENT said they were all greatly indebted to Mr. Hadfield for his paper. There was no doubt the building at Westminster had caused an extraordinary amount of interest, but more especially to architects, because in church work they had to solve the problem of building an edifice for an ancient religion, and yet to conform the building to modern needs and requirements. Westminster Cathedral possessed more interest for the young architect than any other building that had been erected in recent years.

COMPETITIONS.*

(Concluded from last week.)

WITH regard to the much-debated question of the cost of producing the competition drawings, I will confine myself to the conclusion drawn in this matter by the special committee which sat to consider the subject of competitions in 1872. The report of this committee stated that the cost of producing competition drawings, irrespective of principal's time, was from $\frac{1}{4}$ to 20 per cent., or from 2*l.* to 800*l.*; and we know that there are sometimes 100 to 200 sets of drawings, each involving four to twelve strainers.

Professor Kerr recalls cases of 200 sets of designs for competitions in his day, and we most of us remember the Emanuel Church, Exeter, competition, where there were applications for the conditions, although, owing no doubt to the publicity which was given to the growing dimensions of the competition, only some 200 odd sets of designs were sent in, if my memory serves me rightly. I think I am right also in saying that the value of the building was only some 5,000*l.*, and that the cost of producing the drawings submitted in competition exceeded considerably the whole cost of the building. From this it is apparent that the competition for a building costing 9,000*l.* the drawings cost each competitor between 2*l.* and 800*l.* (my own personal estimate is 30*l.*, which seems a moderate one), so that we consider that in a competition for a building costing 9,000*l.* the cost of producing the drawings would be 1,200*l.*, which is nearly three times the sum which would be paid by the architect by way of commission to the architect for design and carrying out the works, and it not unfrequently happens that the cost of producing the drawings in competition for a building exceeds, as in the case of the Emanuel Church, Exeter, the whole cost of erecting the building itself.

I have found that the value of buildings advertised in the years 1894 and 1895 was 540,000*l.*, which is a sum of 270,000*l.* in each year, and in 1858 Mr. George Morgan found that in the previous year, a year of depression in the building trade, public competitions were advertised for buildings estimated roughly to cost 300,000*l.* I may also say that I have it on the best authority—the authority of a gentleman whose opinion would hardly question in this matter—that at least half of the architectural competitions are not advertised in the *London Papers*, so that we may decide that the value of buildings advertised in competition in one year in England amounts to no less than half a million.

The cost of producing drawings in respect of buildings, deduced from the figures I have already given

* A paper read before the Architectural Association by Mr. Cresswell on Friday evening, March 6.

000%, estimating the average competition at 9,000%, and been shown by Mr. Porter that the waste drawings pre- in competition during the twenty-five years previous to ar 1872 if laid edge to edge would pave the way from the top of this house we are now in to Grantham, and if laid ne on top of the other would make a tower 1,000 feet r than the highest mountain in the world. I may add have tested the equation to satisfy myself that it is the ngs themselves that would afford this impressive spec- and we may not cajole ourselves into a belief in archi- al competitions on the ground that this monument to our s composed of wooden strainers.

entlemen, it has been objected that the cost of producing competition drawings should not be considered as lost to ofession, as the bulk of the money passes from the pockets senior to its junior members; but to say this is to e the old economic sophistry which, on the ground that mercial prosperity relied on the circulation of money, used vocate that it would benefit the country to break all its ws once a month—or, let us say, benefit the glaziers that should break their own windows.

ne difference between profitable and unprofitable labour not be urged here, but it may be pointed out that if it vantage to the profession to produce nearly 65,000% worth aste drawings in every year, it would still more greatly it the profession if such drawings when completed were iced as an offering to our common weal, and new sets red for sacrifice in the moils of competition. The atages of competitions as traced by some would then be ed

always feel that we do not fully realise the significance of facts, and perhaps you will bear with me if I draw the arison in the form of wasted labour instead of wasted y. If we estimate the proportion of the total of 65,000% yearly on waste drawings, and which is paid away to htmen, at 58,500%, which is nine-tenths of that sum, and der the average draughtsman as paid at the rate of 2% week, we find that there are in England alone at this ent some 600 healthy persons closely employed solely in roduction of drawings the destiny of which is not in any so useful as to line the footpath from here to Grantham; it is our profession that provides and maintains these men is distinguished purpose. Competitions account for 600 numeraries in our profession—600 more architects and ntial architects than can be distributed in the legitimate ess of designing and erecting buildings.

With reference to some of these figures of mine and cor- vative figures derived from Mr. Porter's historic paper on subject at the Congress of 1871, which I made use of in my ous paper, Mr. Aston Webb, who was then present, and spoke, seemed much depressed at the depreciation of etitions implied thereby, and said that he remembered Mr. r very well, and it should be remembered that that gentle- himself very often took part in competitions, and although, ding to statistics, competitions had such disastrous results, as a competitor on a good many occasions. It was ssible to check the statistics either of Mr. Porter or of Cresswell, and, as had been said, there were such s as "lies, big lies and statistics." Now, gentlemen, ne may check my figures who cares to give a certain inconsiderable number of hours to the advertisement s and news paragraphs, and as to Mr. Webb's facile of the word "lies," I believe Mr. Porter's reputation is vulnerable to irresponsible aspersions of that sort as my is untouched by them. However, I will say no more on matter. Some people are not so sensitive or so circum- in making implications of falsehood as others. In fact, aware of a class of people wherein one man will call er a liar with the idea of conveying friendly congratula- . But what I do strongly protest against is that we should o blindly concentrated upon our own personal interests so consumed in self-laudation that we grudge to extend a deration to the subject which may show that the con- ent way for us individually is not the best way for us ctively.

once heard a young man referring to competitions as a young man's friend." What he wanted to say was, n a young man, and have just won a competition." en who win competitions have to rely upon winning etitions. It is exactly this personal, circumscribed, dicated attitude towards competitions which has kept us all eighty years and more in hopeless quandary, and surely Porter was perfectly justified in competing while yet con- cing the system under which he competed, and his ounced expressions of opinion and the evidence of his against competitions gives special value to the proposi- of his paper, and greater importance and weight to his r depreciation of the whole principle of competitions by n of his conviction being aloof from any personal pro- ies. Personally may I say that I have never entered for competition for the reason, as I believe, that I am

deficient in British sporting pluck; but I should not hesitate to do so if it seemed profitable or amusing, or I found myself in circumstances advantageous to success.

The framing of competitions and the enactment of com- petitions is, as I would insist, purely a matter of business and of commercial enterprise. Upon no other basis is their exist- ence intelligible. There is no question of philanthropic motives existing, nor of a mutual scheme for mutual benefit, that I ever heard of. The conditions of competitions as now drawn up may be, in general, very fairly described as a sham legal instrument. It is a sham form of contract wherein the obliga- tions of the competitors are clearly and exactly defined, and the obligations of the promoters set in such loose, ambiguous terms as render them open to any interpretation that subse- quent events may show to be most profitable to the promoters. The conduct of a public or limited competition is clearly a matter of contract, and it is the business of each party to see that his interests are properly protected in the terms of that contract. It is therefore weak and futile for competitors to persistently cry out and protest when they find that they have the worst of the bargain. It is usual in such cases for us to charge the promoters with having broken their word, and with having falsified their explicit undertakings; but surely redress for such injury as is here claimed lies not in the oblivion of the sympathetic columns of the professional press, but in an action in the High Court. The truth is, however, that it is very rarely that promoters of competitions go back on their precise undertakings, or falsify their explicit promises. This, I observe, is not for any fear of consequences or for conscientious scruples, but for sheer lack of any precise undertakings to go back upon, an utter dearth of any explicit promises to falsify. When an assessor's award is set aside, or when the winner of the first premium is supplanted in his commission to do the work, there are invariably protests long and loud; pathetic appeals to common honesty and fair treatment from us poor architects, who forget our greedy rivalries for the moment, and are bound in one common sympathy of discontent.

We are continually complaining that it is unfair and an indignity to the profession to expect architects to compete when no professional assessor is employed. Yet 50 per cent. of the competitions advertise no professional assessor. Instead they advertise the absence of a professional assessor. Never- theless, we respond to that invitation with our modest waggon- loads of elaborate drawings. We exclaim that it is an affront to offer a premium and to merge it in the commission. Yet we hustle each other to share in that affront, and the enthusiasm with which we respond to the invitation of the promoters might naturally be expected to further reduce the small pro- portion of twenty-two competitions in 100 which still omit to expressly stipulate that the premium shall merge in the commission.

We protest, and take frequent published occasions to flourish the fact in published printings, that the reason we compete and the only inducement to our entering into the com- petition is that we shall be commissioned to carry out our work and complete the execution of our design. We declare that the premium offered is not a provocation to compete, and we say that, with few exceptions, the premiums are inadequate to repay the cost and the trouble of producing designs and draw- ings, and, nevertheless, in spite of these forcible exclamations, I find that in the two years 1894 and 1895 that in 54 per cent. of competitions there was an express stipulation that the pro- moters did not bind themselves to accept the first design, and in 35 per cent. that they did not bind themselves to accept any of the designs, and in none of the published conditions was a promise made to accept a prize design, nor do I recall any case in which the conditions have contained any such undertaking, although I fancy there may have been a few such cases. And there is no instance, I am convinced, nor will there ever be while competitions are promoted by sound-headed men, of the guarantee being given that the assessor's award shall be bind- ing in respect of the commission. In spite of this bland indifference of our avowed and advertised principles on the subject of competitions, do we depreciate these competitions by standing apart, or are we not rather to be held accountable for the existence of such conditions by our persistent and boisterous participation in them?

The 5 per cent. commission is stipulated to include quan- tities or extraordinary expenses in 16 per cent. of competitions. The premiated drawings are to be the property of the pro- moters in 77 per cent.; the written rules and the unwritten rules of the profession are frankly ignored, and we give our approval to this state of affairs in the most emphatic manner possible, and proceed to keep this monstrous thing alive and healthy amongst us in the face of rebuffs and affronts.

The very assessors, who are selected from the pick of us to advise the promoters, themselves become parties to and elaborators of these very usages which we have never found words enough to deplore and execrate.

It has even happened that architects and members of the Institute have acted in the capacity of assessors in competi-

tions where the conditions were not in accordance with the suggestions for competitions published by the Institute; and in thirty-two sets of conditions of competition, which I took as they came to hand from the portfolio kept at the Institute library, I find that out of the twelve cases which provide for the appointment of an assessor no less than eleven stipulate that the premium shall merge in the commission, that ten state that the premiated designs and drawings are to be the property of the promoters, and that in every single case there is an express clause relieving the promoters of responsibility to accept the prize designs, and in one instance of a competition for a 5,500/- building with a first premium to merge in the commission, it is stipulated that the 5 per cent. commission shall include travelling and all expenses.

Is it not, I will not say reasonable, but the only conceivable result, that promoters of competitions should treat our wordy protests with small consideration, as evidences only of professional jealousy and professional squabbles, when our weakness, our inconsistency, and our scrambling greed is so flagrant and so palpable a denial of all that we say?

What I wish to lead up to is the conclusion that the impracticable and unfair qualities of public architectural competitions as now conducted is not to be laid to the charge of the people who promote them, but is to be entirely laid to the charge of ourselves, who have in all particulars and details made the procedure, traditions and the conduct of competitions just exactly as they are and exist in every respect and in every particular.

There is nothing unusual or difficult in our situation at the outset. We are dealing with ordinary business men of our own nationality, whose prejudices we thoroughly understand, and who are bound by the same laws as bind us. There is the fair commercial battlefield before us.

When a man or a corporate body—it does not matter which—wants a thing, it is his reasonable duty to get it at the fair market rate, and to give no more for the thing he wants than what it is worth. I cannot see why British subjects, or, indeed, any one else ought to be placed under an obligation to reconstruct the ordinary bases of business transactions because they may happen to be dealing with the profession of architects. The attitude of these people is perfectly simple and reasonable, and is all, as business men, which we have any right to expect. They make a certain offer for a certain thing, and it is their business to see that they get what they want, and whatever they get they get at our price—please remember that, gentlemen—and not at any artificial price.

They get it at the market value, neither more nor less. If they choose to make an attractive offer they can command the ideas of the leading architects of the day. If the offer is an inconsiderable one they will win only the services of incapable or unsuccessful men who value their services at a low rate, and I feel bound to confess that, as a matter of ordinary foresight, when I organise a competition, knowing that the approval and gratitude of the profession at the offer of a fair premium would possibly take the form of some 5,000 deal strainers delivered at my door, I should feel, with all the good-will in the world, not justified in offering a sum involving responsibility for such an exuberant display of gratitude.

I insist, gentlemen, that the whole matter is in our hands, and that the issue is clear and easy. We have only got to make the demand, not indeed in peevish letters to the papers, or on long-winded occasions of this description, but to make the demand with the ordinary emphasis of men who know what they want, and who mean to stand by the principles of conduct which they know the fulfilment of their wants demands of them.

So surely as we declare in this manner that we will be parties to no competitions of which the conditions are unreasonable, ambiguous or incompatible with personal or professional dignity, straightway such competitions will cease to exist.

Twenty years ago some effort was made to give some real expression to the general conviction that architects should not compete where no professional adviser was employed by the promoters. I refer to the memorial signed by 1,300 architects, who bound themselves not to compete except where a professional assessor was employed, which was presented at the Institute by Mr. George Edmund Street in 1881.

What generally is the result of that comparatively limited and local effort—I say local as affecting only a certain status of practitioners—is this: that while the Special Commission of 1872 found that a professional assessor was rarely or never employed, at the beginning of this century 50 per cent. of competitions advertised the employment of a professional assessor.

I think there is a great deal of what must appear to unprejudiced persons outside our profession as sheer foolishness and nonsense in all the outcry we make. The truth is that it is ourselves whom our quarrel is with, not the men who will sacrifice their dignity and walk in lower planes, and work for less than what we can bring ourselves to consent to. We want the thing offered, but not at the price to be paid; and yet, for

all our outcry against the moral obloquy of promoters of competitions in refusing to accept a design they do not like, I have yet to hear of any case in which the competitor who unfortunately was handed the commission ever made any difficulty, what about accepting it.

From the lofty tone we adopt in these matters we should expect the favoured architect to bow, present thanks, decline on the ground that it was a gross injustice to his professional brother who had been awarded the premium, that profession of which he was a member strongly disapproved such irregularity, and that, therefore, he must decline to accept it.

Personally, I am thankful to think that no such privilege exists in our ranks, but if our attitude was really genuine towards competitions, as we declare it to be, this is the attitude we should take individually in being met with a case of that kind. But were we genuine such cases would not arise, because we should see that the conditions were properly drawn; we should not compete unless their terms and the details of the matter were in accordance with our principles; and if any attempt was made to jockey us, we should find our remedy in a court of law. If we cannot keep off unruly competitions by other means, by all means let us take the pledge—let us join certain active society lately started, and forswear competition unless they are as we hold they should be. My own intention in that most praiseworthy society is somewhat abated by formidable propaganda for talking. We have surely enough and to spare of that; it is entirely useless unless architects abstain from competing.

The only way to secure that competitions shall be conducted as we wish them conducted is to have nothing to do with them unless they are as we approve.

Mr. H. W. WILLS, who proposed a vote of thanks to the authors of the papers, said he disagreed with all that Mr. Creswell had said. Those who decried competitions for that it was not possible to do away with the competition between man and man in architectural practice. One of the greatest sources of disappointment that architects had was when they competed for a building and were successful, promoters of the competition changed their minds and sometimes decided not to erect a building at all. The successful architect in such cases had expended much time and money working out his drawings, and there was little hope of remuneration. It would be well to reform this state of affairs and rule promoters by such a condition that gave competition to the architect. If the promoters of a competition not accept the author of the premiated design as architect, the premium should be fixed at 1½ per cent. on the estimated cost of the building. A condition of that kind would abolish the cause of the unstable competitions.

Mr. W. H. SETH-SMITH, in seconding the motion, said the future would bring no diminution in competitions. All architects could hope to do would be to regulate the system, stop the abuses. Great progress had already been made, architectural competitions were better in principle than had ever been. Although, said the speaker, he had not one of those very successful men in competitions, yet he thought that the competitions he had engaged in had been a direct benefit to himself and to his staff, and there was nothing but praise to bestow upon the system.

Messrs. A. Brumwell Thomas, W. A. Pite and Murray also spoke of the advantages of competitions to a young architect.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

A GENERAL meeting of this Society took place on the 12th inst. Mr. Butler Wilson, F.R.I.B.A., presented an interesting paper on "The Planning of Recent American Libraries" was delivered by Mr. Sydney Greenslade, who made a special tour in the States for the purpose. The speaker alluded to the great impetus given to the library movement through the generosity of Mr. Carnegie. The American architect, with unequalled opportunities, had recently produced some almost perfect plans, though new developments were always taking place. In large libraries the special room for its special collection had become a law, also the small room for special study. The "open access," as opposed to the "indicator" system, was being rapidly adopted, and naturally wrought changes in the plan, so that the borrower might readily means of selection. Librarians nowadays were certain of their requirements, so that to-day there should be few obstacles to the provision of suitable library buildings in this country. Numerous views accompanied by descriptions were given of recent examples in the States.

A discussion followed, in which Mr. T. W. Hand, the librarian, championed the cause of the "indicator" system, as opposed to that of "open access," which resulted in the perusal of the first and last few pages of works of fiction, their replacement on the shelves. A vote of thanks was accorded the lecturer on the motion of Mr. W. H. T. seconded by Mr. Robert P. Oglesby.

YORKSHIRE SURVEYORS AND ARCHITECTS.

PAPER was read by Mr. R. E. Leader at the last meeting of the Sheffield Society of Architects and Surveyors, on "Surveyors and Architects of the Past." Mr. T. Winder pre-

Mr. Leader, dealing first with surveyors, mentioned John Wilson, who, by direction of the Earl of Arundel, in 1637 made surveys of the Sheffield and Worksop estates. Who was Harrison was a question to which he had in vain sought answer, but from entries in the Wilson MSS. it seemed probable that Lord Arundel brought him and his staff of assistants from London or elsewhere. Equally shadowy were the old surveyors with whose names one occasionally met. Among these was Dennis Lee, to whom the Cutlers' Company in 1551 paid the munificent sum of 10s. 5d. "for measuring many miles is between Hallamshire and Whittington." The seventeenth-century surveyor was represented by two of 1698 and 1699, preserved in the Duke of Norfolk's office. One of them, signed "Imx Halton, descriptit," is a drawing of Hesley Park and Hesley Hall, in rough sketch, and also "Chappell furnace." In the other, the surveyor inscribed his name in printed characters as "Imx Halton." They got on to firmer standing ground when the eighteenth century opened. Then Robert Wilson, who might be regarded as the father of Sheffield surveyors, flourished industriously. There were a series of maps by him in the Duke's office—some of great interest, because they gave elevations of the half-timbered houses of the period. Besides being employed by the Town Trustees and the Duke of Norfolk, Wilson was among the many engaged by the promoters of the River Don Navigation. Contemporary with Wilson were John Hey, or Gettey (1711 to 1725), Thomas Smith (1710 to 1722) and William Kitchin (1728 to 1730).

In thinking of them he was led to remark how largely the surveying of the eighteenth century was the natural application of the mathematical knowledge of the schoolmasters of the period. He wished to speak of several other surveyors who were working in Sheffield from 1730 onwards. One of them, John Smilter, had left a striking series of drawings, the most of which were of the type familiar to them in the Noah's Ark of their childhood. From certain similarities of style he did not help suggesting that William and Joseph Dickinson (1747-67) were Smilter's pupils and successors. Mr. Walter Wilson possessed some interesting specimens of the original drawings of the Dickinsons, relating mostly to Norton and the neighbourhood. It was at about the same time that Thomas Whitbridge, author of one quaint picture of the town from the 17th century, flourished. Then there was Ralph Gosling, the youngest son of a yeoman at Stubby, near Dronfield. He was born in 1693, and his will, proved March 1758, described him as of Heeley, schoolmaster, and mentions, along with silver vessels, gold rings and pictures, his surveying instruments. The most of his contemporaries, Gosling found employment in the River Don Navigation surveys. John Eadon, another schoolmaster surveyor, was born in 1730 and was an indefatigable man, who, having educated himself in spite of early disadvantages, came to Sheffield as master of the Free Writing School about the middle of the century. He announced himself ready to survey gentlemen's estates and to furnish "maps in the same elegantly drawn," but he knew of only one specimen of his work, which was a plan of the Spread Eagle property, in Church Street. Its interest consisted less in itself than in its being an early and all too rare instance of accompanying documents with a plan of the property to which they relate. He got some satisfaction from the knowledge that a collateral ancestor of his own, for John Eadon was his great grand-uncle, was a pioneer in this direction. A surveyor named M. A. Eadon, who had a bad habit of omitting to date, sometimes even signing his plans, seemed to have been employed about 1737 by the Church burgesses in plotting out land in Pinson Crofts building. Burgess Street and its neighbours were the result. His, too, was the scheme for making Sims Croft. One of his also with occasional names such as John Needham (1747) and George Eyre (1761 and 1768). A solitary specimen signed "Buddle, 1763," and another of 1776, unsigned but evidently of the same hand, were specially noteworthy because of their elaborate sketch titles. The former, a plan of Sheffield Park, a dairy for the Duke of Norfolk, indulged in urns and weeping willows in funeral card style, and the latter had a sepia floral border, with figures showing the old-world method of conveying milk in panniers on asses' backs.

Predominant over, but contemporary with the surveyors of whom he had been speaking were the early Fairbanks, members of a notable Quaker family. The name met one everywhere, and as there were three if not four William Fairbanks in successive generations, it was necessary to step warily in attempting to distinguish father from son, and son from grand-son. As the years went on the patient and conscientious care of William Fairbank, who lived from about 1730 to 1801, brought the reward of complete mastery. He elaborated his drawings with a loving and leisurely minuteness which, con-

sidering the minuteness of the output for the Norfolk estates alone, apart from other surveying, and the fact that he was at the same time conducting a school, excited the admiration and surprise of so good a judge as Mr. Thomas Winder. Mr. Leader having dealt somewhat exhaustively with the Fairbanks, mentioned William Jessop, who in 1785 was retained to make a survey and to advise on the possibility of equalising the supply of water to the various works on the Sheffield rivers, and alluded to other less known men, including Thomas Scholefield, of Queen Street, who combined with his readiness to survey land the duties of a victualler, a combination met with again in 1822, when, in the list of land and building agents and surveyors, occurred the name of Joshua Bishop, Rising Sun, Ranmoor. Mr. Leader concluded this branch of his subject by speaking of surveyors of the beginning of the nineteenth century, including Paul Bright, who was in the Wicker from 1828 onwards; Marcus Smith, a connecting link with the Duke's office, and with the present firm of Smith-Denton & Co.; John Fowler, of Wadsley Hall, the honoured founder of the St. James's Street firm, and the father of a race of distinguished engineers; John Townend, who was trained in Messrs. Fowler & Sons' office, and Mr. Samuel Furness Holmes, who was born in 1821, in "the old Plague House" at Eyam.

Turning to what he described as "a few notes on Sheffield architects," Mr. Leader said he had not to go so far back as in the case of surveyors, for practically there were no local architects until some seventy or eighty years ago. Taking a survey of the older public buildings of Sheffield one was struck by the regularity with which, whenever anything more important than dwelling-houses, within the scope of intelligent masons, was required architects were imported from other places. The explanation was found in the geographical position of Sheffield, and the humble standing of its inhabitants. There was little scope for the talents of superior architects, and so when St. Paul's Church was to be built (1719), Mr. Platts, who erected Wortley Hall, was called in; when the parish church had to be repaired in 1777, Mr. Thomas Atkinson was brought from York; for further restorations in 1802 Mr. Charles Watson came from Wakefield, and to him also was entrusted the designing of the Waingate town hall in 1805. Mr. Leader mentioned other instances where work was given to outside men, and added that a race of native architects was at the same time arising to claim its own. Just as the old surveyors were evolved from schoolmasters, so the earlier local architects were developed from builders.

It was not until 1825 that Edward Drury & Son were designated architects as well as builders. And that too was precisely what happened in the case of the Flocktons. Thomas Flockton, carpenter and builder, Rockingham Street (1821), brought up his son to the trade. He made him a thoroughly competent workman. But he also had the sense to give the boy a better "schooling" than he himself possessed, and the result of the combination of theory and practice was seen when, in 1833, William Flockton had laid aside cap and apron, and was established as an architect in Devonshire Street. The Mount, which he put up about this time, and Wesley College erected a year or two later (1836), need not be claimed as indicating originality, or implying any deviation from well-defined types, but in appropriateness to their situation, and in the boldness with which they soared above the common level, they are remarkable for a confident ambition amounting almost to genius, and they showed that native talent could achieve results of which elaborate professional training need not be ashamed. He did not know whether the origin of Mr. Samuel Worth, in whose office the late Mr. Mitchell-Withers and Mr. J. D. Webster were pupils, was similar, but about the time of which he was speaking they were in the full swing of a movement in which men of this class were asserting themselves, and, whether by rule of thumb or by following what could be learned from text-books, were producing creditable, if imitative work. Examples of this were the Free Writing School (1827) and the General Cemetery (1836), by Worth; the Botanical Gardens entrance (1836), by B. B. Taylor; and the Cutlers' Hall (1832), by Taylor and Worth jointly.

But another great step in the evolution of the profession was already being taken. A new generation was arising equipped with a special training the builder-architects lacked. The name of John Gray Weightman first appeared in the directory of 1833. In 1837 Mr. Matthew E. Hadfield was at the Corn Exchange. Both had been pupils at the office of Woodhead & Hurst, Doncaster; both had extended their experience in London, Mr. Weightman under Sir Charles Barry and Professor Cockerill, Mr. Hadfield under Mr. P. F. Robinson, and by working at drawings for the new Houses of Parliament. These, full of enthusiasm, went into partnership in 1838, Mr. Weightman having already built the Collegiate School (now Grammar School), and Mr. Hadfield the Park Church. The elevating influence they exercised on the architectural renaissance of the town was reinforced when in 1845 the late Mr. Thomas James Flockton brought to his father's

office the fresh and larger knowledge obtained under the influence of Sir Gilbert Scott and Mr. John Johnson. He trusted he should not be considered unappreciative of the work of many others if, having glanced at a few of those who have predominating influence in Sheffield's self-assertion of its architectural capabilities, he stopped there.

Looking through the lists of fifty years ago one came upon familiar names, tempting to reminiscence—John Frith, with his curious excursion into the morasses of theological inquiry; Charles Unwin, Rooke Harrison, Thomas Frederick Cashin, Edwin Falding, George Wilson, Alfred Scargill, and their compeers. But recollections of these would, so far as he was concerned, be rather of their personal characteristics than of their architectural skill. And still more imperative was the obligation to avoid later references. One had only to look round for proof that, despite the small beginnings it had been his lot to describe, the architects and surveyors of Sheffield could hold their own against all comers in sound practical knowledge, ingenious and even bold adaptation of means to ends, mastery of design and artistic feeling. It only remained for him to congratulate their profession on the vigorous life of which that active Society was one of the manifestations, and to acknowledge the willing and courteous aid he had received wherever his wandering footsteps had led him in seeking material for that paper.

The lecture was well illustrated by old plans and maps, which were lent for the occasion by Mr. T. Walter Hall.

On the motion of Mr. E. M. Gibbs, seconded by Mr. R. W. Fowler and supported by Messrs. W. C. Fenton and T. Winder, a vote of thanks was accorded to Mr. Leader for his interesting lecture.

MANCHESTER INFIRMARY SITE.

THE special sub-committee of the Manchester Corporation appointed on February 5, 1903, to consider the subject of the infirmary site have prepared the following report:—

Consequent upon the decision of the trustees of the Royal Infirmity not to build upon the present site, a letter dated January 15, 1903, has been received from the Infirmity Board to the effect that they are desirous of selling the entire area. A copy of this letter will be found in the appendix to this report, along with the proceedings of the special committee since their appointment by the City Council on November 10, 1902.

It is therefore necessary that the City Council should approach the question under a sense of the fact that this is a final attempt to deal with the whole matter.

There cannot be a doubt that public opinion is favourable to the acquirement of the property by the Corporation upon reasonable and equitable terms, with a view to the site remaining as an open space, unencroached upon by buildings of greater magnitude than those now in existence. Owing to the anticipated relief of the rates from contributions by the Ship Canal and the tramways, the time would appear to be propitious. The sale of the King Street Library is likely to afford a not inconsiderable sum in relief of the cost of purchase by the erection of the new library on the infirmary site; and again, further relief may be anticipated by the co-operation of the art gallery committee in the provision of galleries on the top storey of the building to be erected by the free libraries committee suitable for art gallery exhibition purposes, and perfect of their kind, in substitution for the new buildings now proposed to be erected upon land already purchased at a cost of 25,000*l.*, and the cost of the erection of which would probably be more than a further 25,000*l.*—the land to be disposed of and the cost of buildings to be saved; add to this a further sum of 50,000*l.*, being the margin between the sum to be realised by the sale of the King Street site and the probable cost of the buildings for joint free library and art gallery purposes.

It would thus appear to be quite fair and within the mark to take credit for 100,000*l.* towards the purchase money. This amount would be considerably increased if the Council were to decide to dispose of the Royal Institution and to locate the art gallery entirely on the infirmary site.

Sketch plans showing (1) the suggested new building line of the improvement committee, and (2) a form of building (given solely for the purpose of indicating the amount of accommodation adequate to the needs of the free libraries and art gallery committees) are sent herewith.

The total area of the infirmary site is 19,552 square yards; the land now covered by infirmary buildings is 6,670, leaving 12,882 square yards of open space. The suggested building line of the improvement committee would give 4,694 square yards to the surrounding streets.

The building shown on the sketch plan sent with the report would cover an area not greater than 5,000 square yards, with the result that the open space would be increased by some 1,650 square yards.

Supposing a building to be erected with a central shown, covering in all 5,000 square yards, it can be demonstrated that ample accommodation can be found both the free libraries and art gallery committees without going to any great height.

A basement of 5,000 square yards (suitable in every way for storage) and a ground floor of 5,000 square yards, with a first floor of 3,500 square yards (1,750 yards), will suffice the free libraries committee; the second half of first (1,750 square yards) and the whole series of galleries (3,500 square yards) would give an amount of administrative and exhibition space equal to the prospective requirements of the art gallery.

The sum of 400,000*l.* for the purchase of the whole (including the interest of the Infirmity Trustees in the Esplanade) has been spoken of as being fair and reasonable. This sum your sub-committee recommend should be offered as they do not consider that any resort to arbitration is necessary or desirable. Your sub-committee suggest that the purchase money should be paid by instalments as follows: 100,000*l.* on the obtaining of statutory powers, 100,000*l.* on vacant possession is given, 100,000*l.* twelve months later, the remaining 100,000*l.* twelve months later again. To take into account the sums in relief from free library and art gallery rearrangements as calculated above, amounting to 100,000*l.* the eventual charge on the city after the whole of the purchase money is paid, say four years hence, including sinking fund and interest, would not exceed one penny in the pound per annum on the rates until the sinking fund liquidated the debt.

The total area of the site is 19,552 square yards, and the infirmary buildings which are to be removed occupy 6,670, leaving the open space is 12,882 square yards.

EXETER CATHEDRAL.

THE following additional correspondence respecting the proposed new windows has appeared in the *Times*. Mr. Stuart Moore writes:—

I cannot cope with the Dean of Exeter. He perverts my words, and unfairly alleges that I said what I did not say. Then he quotes his version of my statements in quotation marks. Your space will not allow of my answering his letter in detail, and it would be useless, as he rejects all evidence that does suit him; witness his letter in answer to Mr. Read. I claim in his eyes a discredited witness. His method of controversy appears to be to abuse his opponent and his witness. A well-known maxim in certain cases. I wish, however, from other points I raised, he would either produce that story window in the condition that Archdeacon Freeman described, or I laid it by and packed it so carefully in 1872, or fully aware that it has been cut to pieces and destroyed, and not to dust in the eyes of the public by saying it has been "carefully used." He must know that it has been cut to pieces, and never been restored as I offered to restore it. It is a great pity for it gave the keynote to the original glazing of the choir. Its existence was well known to the Chapter. It was described with the other recently discovered ancient glass in the 7*th* of September 29, October 3 and October 22, 1872. Freeman wrote fully about it in his "History of Exeter" in 1873, lectured on it to the Archaeological Institute in the chapter-house. Mr. Drake wrote a paper on it to the Devon Archaeological Society, and a drawing of one light of it hung in the chapter-house for a long time. The loss of it is irreparable.

Mr. Bodley objects to Peckitt's window, but admits that it marks a period of bad art, and urges that as a sufficient reason for removing it when an opportunity offers of filling the window with better work. But will it be filled with better work? I do not know who is to design it or who is to execute it. It is a rumour that it is to be done by an artist in glass of the name of Bodley. Why should not they restore the ancient glass of the choir, about which no controversy could arise, and leave Peckitt's window alone?

Mr. G. F. Bodley replies:—Mr. Moore, in his letter appears to-day, hardly states the case strongly enough. He says that I "object to Peckitt's window." I think so because of it that I heartily wish it removed and out of sight.

Sir Arthur Helps, in "Friends in Council," after speaking of the influence for good of great works of art, goes on to say: "On the other hand, a thing of ugliness is potent for evil. It deforms the taste of the thoughtless; it frets the man who knows how bad it is; it is a disgrace to the nation who raise it; an example and an occasion for more monstrosities. It must be done away with. Next to the folly of doing a thing is that of fearing to undo it."

In the case of this stained-glass window at Exeter it would be difficult to find words strong enough to express how "poisonous for evil" it is, and what a detriment to a noble interior it should be "done away with."

May I say that I am not an "artist in glass," as Mr. Moore

ns to think? The new window would be done by Messrs. lison & Grylls, under my superintendence as advising itect at the cathedral.

Mr. C. H. Read says:—The Dean of Exeter, in his letter in issue of yesterday, descends to a lower plane. He now pro is to "abuse the defendant's attorney," and apparently for proverbial reason, for his letter contains little or nothing ing to the matter in dispute.

He accuses me of four "improprieties." First, that I had ished our correspondence without giving him notice. If I e erred in this I apologise. But does the Dean regard the rity of the cathedral under his charge as a private or estic matter between him and the Society of Antiquaries? Society does not so regard the matter. It holds rather Exeter Cathedral is a heritage of the English race, and any Englishman is entitled to raise his voice to help in its

Then the Dean professes surprise that I ventured to quote bishoph Temple's own opinion of Peckitt's window, on the ority of a truthful and accurate man, Mr. Stuart Moore, made the statement in the *Times*, and my crime is especi- heinous from the fact that the Archbishop is dead. There subtlety in this that I cannot follow. Does the Dean ose that Archbishop Temple's sayings and opinions on roversal matters will not be quoted long after our time? eems to me a poor compliment to pay so distinguished a n. If I have sinned here I have done so in company of ch I am not ashamed.

But in the whole letter, full of invective as it is, what ecially moves me is the device of insinuating that I (or tly the Society of Antiquaries) desire to prevent a memorial a being raised to the late Archbishop. Here the Dean is onal to a degree that forces me to borrow from his own abulary and stigmatise it as dishonourable. I take pleasure aying that I think every effort should be made to perpetuate memory of so grand and noble a character as that of bishoph Temple, and I have taken every pains to keep his e out of this controversy. The Dean of Exeter apparently o such feeling. The greatness of Archbishop Temple is, ver, not a reason, and should not be made a reason, for roying a part of Exeter Cathedral.

The Dean's third charge is that I sneer at the motives of e who are subscribing to the new window. The sneer was mine. It had its origin in the description of Peckitt's ow as having a "sordid story," due to the motives of those ublished. My own observation on this was that close uiry into the true motives of subscribers, even in Church ers, was unwise—surely a commonplace enough bit of idly wisdom.

The Society of Antiquaries is quite satisfied with the com- ence of its expert, even though he be anonymous to the an; and I may mention that the Dean still declines to rm me in what respect the Society's resolution is inaccurate. If the Society wants advertisement, as the Dean alleges, oness that, on the other hand, I think he would have been tent without public attention being called to what he and Chapter propose to do.

So far the Dean. Mr. Bodley's letter calls for little com- nt. He can scarcely be called an impartial witness, and his er only states that Peckitt's glass is not to his taste. But it ed the taste of Peckitt's time, and who is to say that the ow Mr. Bodley will put up may not equally be condemned 50 years' time?

Stripped of all the personalities which the Dean has im- ted into the controversy, the question really is whether e exists any structural or other justification, apart from the igerous issue of good or bad taste, why the Dean and pter of Exeter desire to remove Peckitt's window. The iety says there is none. The Dean is silent.

EDINBURGH ARCHITECTURAL ASSOCIATION.

MEETING of the Edinburgh Architectural Association was held in the rooms, 117 George Street, on the 11th t., Mr. A. Hunter Crawford, president, in the chair. Mrs. msay Traquair submitted a paper on the subject "Decora-," illustrated by limelight views. First, with regard to tude of the decorator, she said, the architect came first, ing the way and creating the decorative artist. It was the ict who must give the favourable soil and atmosphere hich the decorative worker sprung to life. Decoration ould become a sort of natural growth, and was only good in roper place; taken out of that place it would be a beauti- fragment, but it was only a fragment. She spoke of line as eans towards expression, and pointed out that the Greeks ays gave prominence to the angle when they wanted ivity, and gave prominence to horizontal and vertical lines en they wanted quietness. The relations between line and our and the uses of line and colour in decoration were ched upon, and it was pointed out that a flat tint corre-

sponded with a straight line, a graduated tint with a curved line, and broken colour with an angle. She emphasised the importance of the inferior parts of decoration being designed as carefully as the principal bits, and of not being given to inferior hands, otherwise the principal parts were apt to look like pictures in more or less unconnected surroundings. Mrs. Ramsay Traquair was thanked for her lecture. On the motion of Mr. William M. Page, one of the hon. secretaries, the President was congratulated upon his election as a Fellow of the Royal Institute of British Architects.

FITZWILLIAM MUSEUM.

THE Fitzwilliam Museum Syndicate in their fifty-fourth annual report state that Mr. F. R. Earp, M.A., Fellow of King's, has resigned the office of assistant-director after a tenure of over two years. They desire to record their sense of the value of Mr. Earp's services. The number of visitors to the museum during 1902 was 44,981, and to the Museum of Classical Archaeology 3,935. Among the gifts to the museum during the year the following may be mentioned:—The Rev. W. G. Searle, M.A., Queen's College, has presented 150 coins of many dates and countries and various books, including a manuscript "Horræ," Dutch, of the fifteenth century; the Director of the National Museum, Athens, a selection of fragments of pottery from Melos; Mr. H. V. Thompson, formerly scholar of Trinity, a manuscript of the fourteenth century, formerly in the collection of Lord Ashburnham, containing the "Chronicon" of Martinus Polonus, tracts by Bernard Gui and other texts; the Rev. H. S. Cronin, B.D., Fellow of Trinity Hall, an interesting series of coins from Asia Minor; Mr. C. H. Hawes, Trinity, a collection of Oriental pottery and porcelain, also Chinese and other coins; Captain Mark Sykes, Jesus, a collection of twenty-five glass vessels of the Roman period found near Bethlehem; Mr. H. J. Dent, Fellow of King's, autographs of Benedetto Marcello, Haydn, Schumann and Moritz Hauptmann, and the corporations of upwards of forty boroughs in England specimens of Coronation and other medals struck by them in recent years. A large collection of impressions of seals belonging to the Antiquarian Society has been deposited in the museum. The principal purchases were a painted terra-cotta sarcophagus of the fifth century B.C. from Rhodes; a series of Byzantine coins; a finely-illuminated copy of the "Decretum" of Gratian, of the early part of the fourteenth century, from the collection of John Ruskin; a medical manuscript, partly in English, of the fifteenth century, with armorial illuminations; a copy of Bertacchinus de Firmo's "Repertorium Juris utriusque" (three vols., I, II., Rome (?), 1481, III., Venice, 1494), handsomely illuminated, and a large number of books illustrative of the history of art, including many photographic reproductions of the works of early painters, principally Flemish, and important monographs on single artists.

Proposed Quantity Surveyors' Association.

SIR,—Arising out of correspondence which has recently taken place upon the question of the desirability of a distinctive Association being formed for quantity surveyors, a meeting of London and provincial members of the profession was held on March 6 at the offices of Mr. F. B. Hollis, 17 Bedford Row, London, W.C., Mr. W. Hoffman Wood (Leeds) in the chair, when it was resolved to seek the co-operation of gentlemen favouring such formation.

The following were the main resolutions passed at the meeting:—

1. That there was a distinct need for an Association solely for quantity surveyors.
2. That such an Association be named "The Quantity Surveyors' Association."
3. That in the formation of the Association the value and importance of the Surveyors' Institution be fully respected and recognised, and that that body shall be courteously approached to assist in the registration of the Association, and that members of the Surveyors' Institution who are practising as quantity surveyors be invited to also join the distinctive Association.
4. That none but qualified quantity surveyors be admitted to membership.

The main objects of the proposed Association being briefly as follows, viz. :—

1. To uphold the dignity and importance of the profession, and to provide the means for quantity surveyors to meet and discuss subjects of interest and to settle cases of difficulty.

2. As a guarantee of efficiency and fair dealing as between the building owner and the builder.

3. As an additional means of insuring the confidence of architects.

4. To encourage uniformity of practice.

It was further resolved at the meeting that the founders' first annual subscription should be one guinea, which should cover entrance fees, and that after the registration of the Association it is suggested that the entrance fee should be five guineas and the annual subscription two guineas.

The promise of your influence and support will be greatly esteemed.

A post-card is enclosed, addressed to the (interim) hon. sec. of the Association, and you are courteously requested to express your views thereon, and return it to the above address as soon as convenient.

A general meeting will be called at an early date to elect a president, officers, &c., of which you will be duly notified.—

Yours faithfully,

March 1903.

F. B. HOLLIS,
Hon. Sec. and Treasurer.

[The above letter has been sent to all London and provincial quantity surveyors, in so far as their names and addresses can be obtained from directories and from the secretaries of Architectural Associations. The hon. sec. will be glad if any quantity surveyor who has been omitted will communicate with him at once at 17 Bedford Row, London, W.C.]

GENERAL.

The King and Queen visited last week the Exhibition of Pictures by Old Masters at the Royal Academy of Arts, Burlington House, in the evening. Their Majesties were received by Sir Edward Poynter, president, the members of the Council, and Mr. F. A. Eaton, secretary.

His Royal Highness the Duke of Cambridge, K.G., president of the Sanitary Institute, will preside at the annual dinner of the Institute to be held on Friday, May 15, at the Hôtel Cecil.

Mr. Rowland Plumbe, F.R.I.B.A., of 13 Fitzroy Square, W., informs us that he has taken into partnership Mr. Frank M. Harvey, who has been associated with him for a period of over twenty-one years. The practice will be continued as heretofore at the above address under the style of Rowland Plumbe & Harvey.

An Exhibition of pictures produced in the dry oil colours of M. Rafaelli, corresponding with that held in London, will be opened on Sunday in Berlin.

The Agent-General for South Australia announces that Dr. Morgan Thomas, of Adelaide, who died on March 8, has bequeathed the sum of 50,000*l.* to the Public Library, Museum and Art Gallery of South Australia.

The Heirs of the late Henry Pille have taken an action in the French courts in order to put a stop to fabrications bearing the name of the painter. In one day no less than twenty drawings were seized by the police.

The Wesleyan Chapel Committee has sanctioned a further expenditure on new chapels, Sunday schools and mission halls of 150,000*l.* The work carried on in Liverpool by the late Rev. Charles Garrett is to be extended by the erection of new mission premises estimated to cost 43,000*l.* A grant of probably 10,000*l.* will be made to this scheme from the Wesleyan Twentieth Century Fund. New mission premises are also to be erected in Hull at an outlay of 32,000*l.*

The Emperor of Austria has conferred the Cross of Commander of the Order of François-Joseph on M. Tony Robert Fleury, the historical painter, vice-president of the Society of French Artists of Paris.

The Iron and Steel Institute have resolved that the Bessemer Gold Medal for this year shall be awarded to Sir James Kitson, M.P., past president, in recognition of his great services to the iron and steel industry of Great Britain. The presentation will be made by Mr. A. Carnegie on May 7.

New Works are about to be erected at Frazerburgh, at a cost of 20,000*l.*, for the Pneumatic Tool Company of Chicago.

The Jury of the examining committee for architectural designs to be sent in to the coming exhibition of the French National Society of Fine Arts will consist of MM. Pierre Selmersheim, Sauvage, Guillemonat, with MM. Plumet and Lambert as supplementary members.

Mr. Christopher Bales, architect, died in London on the 13th inst. in his ninety-fourth year.

The University of Michigan is erecting a new engineering building at a cost of 140,000*dols.* Among the more important features of the building and its equipment will be a naval testing tank, a compressed-air room, a hydraulic laboratory, a cold-storage department and steam-engine and

electric rooms. The tank for testing ship models is 30*ft.* long, 22*ft.* wide and 10*ft.* deep. It has connected with a dry dock large enough to hold a model 10*ft.* long.

The Municipal Buildings at Aberdeen are to be reconstructed. The burgh surveyor's plan would cost 6,000*l.* carry out, while the city architect's would only cost 3,000*l.* The former received most approval.

A New Library and choir vestry to form an annex to Manchester Cathedral are now in course of construction to the designs of Mr. Basil Champneys.

Mr. John B. Pierce, a well-known architect and surveyor, died last week in Norwich. He was a pupil of Mr. J. Morant. He built several schools and churches in Norfolk and Suffolk.

The Estimate of the outlay on public works and buildings during the coming financial year is 2,557,712*l.*, an increase of 265,699*l.* over last year's amount.

A Scheme has been suggested for the erection of a Wesleyan church at Penwortham, near Preston, at a cost of 3,000*l.* The building is intended to replace the present inadequate structure, erected in 1883 as a school-chapel. When the new church is built the present premises will be continued as a Sunday school, and its seating accommodation will be between 300 and 400 persons.

A Paper will be read at the meeting of the Institution of Civil Engineers on Tuesday, by Mr. Amyas Morse, on "Protection Works of the Kaiser-i-Hind Bridge over the Sutlej, near Ferozepore."

The Manchester City Council have approved of a report of the special committee offering 400,000*l.* for the extension of the Royal Infirmary, and on Monday next the board of governors of the infirmary will consider the subject.

Mr. Robert Moore, architect, of Middlesbrough, has been awarded property which has been proved of the gross value of 2,005*l.* 7*s.* 5*d.*

York House, Twickenham, is shortly to be sold. It is a historic mansion, as it once belonged to Lord-Chancellor Clarendon, and is believed to have been the residence of Duke of York, afterwards James II.

The three remaining bays of the cloisters of the Priory of St Bartholomew have now been purchased, and a facade obtained for connecting them with the church by means of original monks' doorway, which, though at present bricked up, can still be traced in the wall of the south ambulatory. A historical and descriptive lecture on the church will be given to-morrow, March 21, at 3 P.M., and repeated on Saturday, March 28, at the same hour. The crypt and other portions of the church will be open for inspection without any fee, and contributions will be invited towards the cost of the new acquired cloisters.

The Manchester Corporation special committee dealing with the proposed revision of the fair contracts clause Monday received Mr. Geo. Macfarlane, president of the Manchester and Salford Association of Master Builders, and afterwards Messrs. George D. Kelley, secretary of the Trades Council, and Tom Fox, chairman of the fair contracts committee of that body. Both deputations had suggestions to make. Mr. Macfarlane submitted a draft of an additional section to the clause, whilst the representatives of labour advocated firm adhesion to the clause as at present standing, with a slight addition of words to more clearly express meaning. As a general result of the conference it is understood that the committee felt considerably assisted in its effort to arrive at a satisfactory solution. The points in dispute seemed to rest mainly on doubts as to the correct interpretation of the text. The town clerk was requested to draft a clause which shall be as far as possible void of ambiguity, and it is hoped that when next they meet the committee will be able to submit to the Council a code of working in relation to contracts that shall be agreeable to all parties.

The Treasury have sanctioned, subject to the approval of the House of Commons, the expenditure of 185,470*l.* in the financial year ending March 31, 1904, on the provision of additional accommodation in London and the country for the postal and telegraphic services. Amongst the works included in the programme are the following:—Liverpool, Mossley Hill, new sorting office, 1,020*l.*; Liverpool, Lark Lane, new sorting office, 1,850*l.*; Liverpool, Northern District Office, 9,000*l.*; Liverpool, Old Swan, new sorting office, 1,600*l.*; Liverpool, Seaford, new sorting office, 1,550*l.*; Warrington, new post office, 16,200*l.*; Wigan, post office extension, 5,200*l.*; Barrow-in-Furness, post office extension, 7,170*l.*; Bootle, new post office, 5,500*l.*; Crewe, new post office, 4,000*l.* The new post office at Preston, upon which 23,474*l.* has already been expended, is to be completed this year at a further cost of 3,000*l.* In regard to the new post office at Burnley, 8,000*l.* to be spent on it in the coming financial year, but it is not expected to be completed until the following; its total estimated cost will be 11,250*l.*

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 5,000l. Premiums of 60l., 25l. and 15l. will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

CASTLEFORD, YORKS.—March 31.—Designs are invited for free library. Premiums 15l. and 10l. respectively. Mr. H. I. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—April 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums of 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, Wycombe.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60l. and 30l. are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—March 31.—Designs in competition are invited for extension of the town hall. Premiums of 300l., 200l. and 100l. are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000l. Premiums of 75l., 50l. and 25l. respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

SUNDERLAND.—April 30.—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100l., 50l. and 25l. will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

YEOVIL.—April 10.—Premiums of twenty and ten guineas respectively are offered for the two best schemes for laying-out a piece of land on which it is proposed to erect a town hall, municipal buildings, markets, &c. Particulars may be obtained from the Borough Surveyor, at the Town Hall.

CONTRACTS OPEN.

ALNWICK.—March 31.—For erection of a 150-quarter malt-house, adjoining the Tweed Dock and North-Eastern Railway sidings at Tweedmouth, Berwick-on-Tweed. Messrs. Brewill & Bailey, architects, 44 Parliament Street, Nottingham.

BARKING.—April 3.—For construction of a temporary bridge and road, concrete, stone and brick abutments, &c., for a new bridge over the river Roding, the formation and paving of roads and footpaths in connection therewith, in the urban district of Barking. Mr. J. Percy Sheldon, chief surveyor, County Offices, Chelmsford.

BIRKENHEAD.—March 28.—For rebuilding of the upper stages of the tower of the town hall in Hamilton Square, Birkenhead. Mr. Henry Hartley, architect, 8 Harrington Street, Liverpool.

BRADFORD.—March 25.—For erection of a new cart shed at Harris Street staith. Mr. Frederick Stevens, town clerk, Town Hall, Bradford.

BRIGHOUSE.—March 26.—For erection of a chancel, &c., to St. Martin's Church. Mr. C. Hodgson Fowler, architect, The College, Durham.

BRIGHTON.—March 24.—For erection of a band-room at the Warren Farm schools. Mr. B. Burfield, clerk to the Guardians, Parochial Offices, Brighton.

BRISTOL.—March 30.—For enlargement of Chester Park schools, Fishponds. Mr. W. V. Gough, architect, 24 Bridge Street, Bristol.

BRISTOL.—March 30.—For erection of a girls' school and domestic subjects' centre at Windmill Hill, Bedminster, Bristol. Messrs. H. J. Jones & Son, architects, Bridge Street, Bristol.

CANTERBURY.—March 30.—For fixing wood and glass screens in the committee-rooms in the municipal offices, Guildhall Street. Mr. Arthur C. Turley, city surveyor, Guildhall Street, Canterbury.

CATERHAM.—March 25.—For erection of (1) sanitary annexes to ward blocks; (2) laundrymaids' quarters, at Caterham Asylum, Caterham, Surrey. Mr. T. Duncombe Mann, Metropolitan Asylums Board, Embankment.

CAYTON.—For erection of a Wesleyan church and school at Cayton, near Scarborough. Messrs. Danby & Simpson, architects, 10 Park Row, Leeds.

CHATHILL.—March 24.—For additions and alterations to property in Taylor Street, Sea Houses. Mr. James Ewing, Sea Houses, Chathill.

CHESTER.—March 26.—For erection of lavatories in the public market. Particulars may be obtained at the office of the City Surveyor, Town Hall.

TRADE NOTES.

THE heating of Truro Cathedral has been successfully carried out by Mr. John Grundy, of London, by means of his latest improved type of combined heating apparatus.

MESSRS. JOHN ALLEN & SONS, LTD., of Kilburn, have been appointed by Royal Warrant building contractors to His Majesty the King.

LITTLE BYTHAM CHURCH, Grantham, has recently been warmed by Messrs. John King, Ltd., engineers, Liverpool, employing their latest improved hot-water heating apparatus.

MESSRS. ANDREW HANDYSIDE & CO., LTD., of Derby and London, makers of steel bridges, roofs, buildings, and structures, have received the contract for the supply of their special type of combined wood and steel roof principal in connection with the new electric-lighting station at Ipswich.

A NEW tower with clock showing the time upon four illuminated dials, 6 feet 6 inches each in diameter, and striking the full Cambridge quarter chimes and hours on a set of heavy bells, has lately been presented to Lindley, Huddersfield, by Mr. James Nield Sykes, J.P., at a cost of 5,000*l.* The clock, chimes and bells were supplied by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds and Newcastle.

THE occasion of the visit of Their Majesties the King and Queen to the "Wild West," at Olympia, afforded an opportunity for something like a *tour de force* on the part of the well-known furnishing firm of Messrs. Oetzmann & Co., of Hampstead Road, who were called upon to furnish and decorate, at exceptionally short notice, a special temporary Royal box, on the ground floor of the great building. Pretty furniture and draperies were specially requisitioned, and the result was both luxurious and charming. Messrs Oetzmann are also responsible for the permanent Royal box at the popular show, which is so attractive with its dainty eighteenth-century French furniture and artistic decorative details.

WE are informed by Messrs. Goodwin, Barsby & Co., engineers and ironfounders, of St. Margaret's Ironworks, Watling Street, Leicester, that they have obtained from the Nottingham Corporation, through the city surveyor, Mr. Arthur Brown, M.Inst.C.E., the order for a set of fine crushing rolls to deal with river gravel. The work is to crush pebbles which have passed about 1½-inch mesh down to about ⅛-inch and less. The larger crushed material is used for filling-in between setts, and the finer crushed material ¼-inch and less is used for

sanding streets and tar-paving. The machine was put in under a guarantee to crush 3 tons an hour under this specification, but Messrs. Goodwin, Barsby & Co. have been able to get as much as 5 tons an hour through it.

VARIETIES.

A NEW school which has been erected by Dunfermline Burgh School Board in the Pittencreeff district of the burgh, was formally opened on Monday.

MR. A. E. PRIDMORE is the architect for the new Poor Law school at Kentish Town, London, N.W., about to be erected.

THE extension of the Chelsea workhouse, which has become necessary, is to be carried out. The architects are Messrs. Lansdell & Harrison, of Basinghall Street, London.

ELECTRIC NOTES.

THE Bath City Council, sitting as an urban sanitary authority, on Tuesday came to important decisions concerning the future of its electric-lighting undertaking. Having been advised to spend 50,000*l.* in reconstruction and extension of their works, the Council received an offer from the Bath Electric Tramways Company to lease the lighting undertaking for thirty-two years, and this was referred to the committee for consideration. On Tuesday they reported, advising the Council not to entertain any further proposals for the disposal by lease or otherwise of the undertaking. The report of the committee was carried. The Council then proceeded to the consideration of a recommendation by the committee to expend 25,000*l.* this year on necessary works as part of the scheme of reconstruction and extension costing 50,000*l.* first recommended by the consulting engineer (Mr. Manville), this report being also adopted.

A PAPER on surface-contact systems for electric tramways, of exceptional interest to Birmingham engineers, was read on the 11th inst. at the Midland Institute, before the local Association of Civil Engineers, by M. Victor Bornand, an engineer who until lately was engaged in designing and carrying out surface-contact tramway systems in Paris. At the outset M. Bornand claimed that surface-contact systems should have preference to overhead-wire systems on primary

sthetic grounds. He also urged that overhead-wire systems
ferred a great impediment to the free movement of fire-escapes,
d furthermore, that they were necessarily of considerable
nger, very much more so, in fact, than the latest surface-
ntact systems of the present day. After going very fully into
e technicalities of the subject, M. Bornand concluded by
awing attention to the many unfounded reports which
peared with respect to alleged unsatisfactory working of
rface-contact systems, and gave the interesting information
at such systems should never cost more than 10 per cent. to
per cent. over and above the cost of trolley-wire systems.
r. Greatorex (borough engineer of West Bromwich) objected
at studs in a street were, in his opinion, more objectionable
an overhead equipment. Dr. Morris, of the University, said
at most towns had agreed that surface-contact systems were
eferable to overhead systems, but up to the present time the
erhead system had proved to be the cheapest in first equip-
ent and working. Should the surface-contact line now in
eration prove satisfactory, he hoped that in Birmingham the
es about to be laid down would be of that system, at any
ce in the centre of the city.

NEW CATALOGUES.

E have received from Messrs. George Farmiloe & Sons,
imited, of St. John Street, West Smithfield, London, their
w catalogue No. 9, which deals principally with sanitary
atters, although at the end prices, sizes, &c., are given for
ate, plain, embossed and stained glass. The catalogue has
en carefully compiled, the illustrations are well printed on
od paper, and what is more important the dimensions and

prices are plainly stated. All the leading sanitary firms'
specialties are illustrated, such as Doulton's, Jennings's,
Hellyer's, Shanks's, &c. The size of the work is such that
use may be made of it. Too often a catalogue is of such
dimensions that it is unwieldy, and an architect or builder
finds it impossible, much as he would like to, to give it office
room. This is not the case with Messrs. Farmiloe's catalogue.
It is really a work of reference, and one which any of our
readers interested in such matters would find of real service.
We have also received from Messrs. Farmiloe a sample of their
new pattern rolled plate glass to which they have given the
distinctive name of "Oceanic." The design is very effective
and pleasing, being a combination of seashore objects, such as
sea-weed, cockle-shells, star-fish, &c.

THE new catalogue of electric, hydraulic and hand-power
lifts manufactured by Messrs. Wm. Augs. Gibson, Limited, of
28 Fleet Street, London, and Provanside Works, Glasgow, is
an admirable example of what high-class printing in combina-
tion with photography can do for the manufacturer. The lifts
comprise every up-to-date patented contrivance to insure
efficiency and safety. And these range from the simple dinner-
lift, to lifts of the most elaborate and costly design. It is not
possible to go into questions of powers, controllers, pressures
and valves, all of which are points of great importance to
engineers having to advise upon these modern requirements—
shall we say indispensable?—to tall buildings. To all who are
interested in these matters we can but recommend them to
secure a catalogue and read what Gibson's, Limited, have to
say upon the subject. There is but one more point we need
refer to, but it is one which affects a large number of those
who are constantly using lifts. With such as are not absorbed
with the business on hand, there is often a latent feeling of
timidity that something may perchance go wrong. This
Messrs. Gibson wisely provide for by sundry contrivances.
Thus, at the end of their descriptions we read, in several
instances, "This lift is fitted with our steel safety catches,
which are so constructed that in the event of the ropes stretch-
ing or breaking, the car remains suspended." Surely, if some
such arrangement is known to secure absolute safety, it should
be made compulsory.

THE scheme has been sanctioned for the erection of a
new church by the Tennyson Road congregation at Preston,
at an expenditure of 5,500*l*.

BUILDING AND BUILDERS.

ST. ANDREW'S STREET Baptist church, Cambridge, is to be entirely rebuilt, partly on the foundations of the old building. The tender of Messrs. Kerridge & Shaw, of Sturton Street, Cambridge, has been accepted by the committee at 7,458/., and the work has just commenced. The architects are Messrs. George Baines, F.R.I.B.A., & R. Palmer Baines, 5 Clement's Inn, Strand, London, W.C.

At the second annual meeting of the Liverpool Building Materials Association, which was held on Monday last, the officers and committee for the current year were elected as follows:—President, Mr. James E. Beard; vice-presidents, Messrs. J. Evans and W. H. Brown; treasurer, Mr. Frank Jones; committee, Messrs. Edwards, Dowler, Wilkinson, Parr, Croker, Ashcroft, Rowlands, Walker and Barlow.

The ceremony of laying the foundation-stones of a new English Wesleyan chapel at Llangollen took place on the 27th ult. The building is designed in the Gothic decorative style, and will consist of nave, transepts and chancel. The roof will be an open one of pitch-pine, and there will be a spire rising to a height of 80 feet. The windows will be filled with leaded lights. The pulpit will be of oak, and there will be accommodation for about 250 people. The cost is estimated at 2,800/.

A SCHEME is on foot for connecting Montreal and Longueuil, Quebec, by means of a tunnel under the St. Lawrence. Plans have been submitted to the Department of Railways providing for a double track tunnel from the south shore to the heart of Montreal, where a central station will be located. The structure will be of concrete and stone masonry lined with enamel brick, and will have a width of 27 feet and a height of 21 feet. The gradients will be 13 to 2 per cent., and the greatest depth will be 15 feet below the mean level of the river.

A VERY interesting example of the Cottancin system of steel-cored brick and steel-cored cement construction is now being completed in the form of a large storage tank for Messrs. James Simpson & Co., Ltd., at Newark-on-Trent. This tank is 115 feet long by 26 feet wide by 12 feet deep; the bottom is formed of a series of steel-cored brick shallow caissons on the Cottancin system, with surface of steel-cored cement tied down to the core of the brick caissons. The containing walls, 12 feet deep, are constructed of steel-cored brick 4½ inches thick only,

reinforced by horizontal and vertical ribs of the same material 9 inches by 4½ inches widely spaced. The steel core of the walls is tied, interwoven with the cores of the caisson bottom thus forming a whole of wonderful strength, for the wall on one side, which is 115 feet long and 4½ inches thick only by 12 feet deep without any buttresses on the inside of the tank has to support the pressure of over 12 feet of unstable and waterlogged soil, and the vibration caused by a heavy good railway running parallel to the tank at a few feet distance and at a higher level. This small but interesting piece of work is attracting considerable attention, and is the first application of the Cottancin system of construction to reservoir work in Great Britain. The Cottancin construction in England has just made contract for the construction of a series of caisson foundation on this system for boilers for a pumping-station for H.M. Office of Works.

URALITE FOR ROOFING.

WE have several times had occasion to draw our readers' attention to the manifold uses of Uralite as a building material. Not the least of these is its suitability as a roofing material, in which connection it is claimed that so far as strength is concerned it is equal to the best slate or tiled roof, while it is, we believe, lighter than any other roofing material in use.

It is fireproof and non-conducting, and keeps buildings cool in summer and warm in winter. It is verminproof, and in the colonies successfully resists the attacks of white ants, &c., whilst it neither expands nor contracts under differences of temperature.

It has already been adopted in this country for roofing workshops, breweries, mills, factories and dwelling-houses.

It would appear that the style of roof illustrated is a step in the right direction, as in case of gales there is less chance of the wind driving rain underneath the roof than is the case with either slates, tiles or galvanised iron, and the makers inform us that even where the material has to be used in the shape of slates or tiles in the smaller sizes they can be so well fixed that a good tight roof is obtained.

The illustration, however, shows that, fixed in colonial fashion, there are few joints—a great advantage in roofing—and the appearance is attractive.

Roofing can be obtained in either white, grey or red colour. The material is an exceedingly efficient fire protector, and has been adopted by the London Hospital and other similar

THE BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.

design has made in this country. Apart from the use for which it is intended, it might with advantage be utilised in art schools to enable students to realise how high a standard is required in industrial work. The name is given of the designer in nearly every case, a practice which deserves imitation, and consequently the freshness of all the specimens is understood. Among the artists who have exercised their skill in Anaglypta decoration are Mr. Voysey, Mr. Owen W. Davis, Mr. Haité, Mr. Sheffield, Mr. Rainger, Mr. Jonquet, Mr. A. Silver, Mr. Kennerley, Mr. Aumonier, Mr. Kimpton, Mr. Moller, Mr. Lamb, &c. They have worked in honourable rivalry, and the results are to be seen in decorations which are adapted to all the varieties of styles now adopted for building. For it is well to understand that the designs are not of the indiscriminate kind which can be utilised for many purposes. Anaglypta is essentially an architectural auxiliary, and all the designs present something of the architectesque in their treatment. Whether employed as panels, dados, friezes, strings, borders, fillings for walls of rooms or halls, ceilings, staircases, it will be found that in each case appropriateness to use as well as beauty have been recognised. In order to give additional effect special mouldings in wood have been prepared for those who prefer them to Anaglypta mouldings. Wood pendants and other aids are also to be obtained. The catalogue is not merely a book of beauty; it contains ample instructions about the application and fixing of the material as well as for making it as effective as possible by the aid of colour. Another advantage is the introduction of sketch plans which will enable the architect to realise how any design which he prefers will work out when repeated or combined with other patterns. By the ingenious arrangement much labour will be saved in architects' offices. The number of elements for margins of various kinds will also become an aid, especially in the adoption of Anaglypta for ceiling decorations. In fact, the utility of the catalogue, which is no mere register of designs, will at once be apparent to every architect. The sizes of panels and other parts are also given, as well as prices. The employment of Anaglypta is, in fact, facilitated by the practical experience seen in the arrangement of the catalogue, and in that way as in others it deserves to be taken as a model by many manufacturers. It should always be remembered that there are many claims on an architect's attention, and he has no time to spare in arriving at inferences when information is not clearly put before him.

One piece in particular may be referred to. This is a

Louis XV. ceiling, having curves so delicate in their contour it would be difficult to realise them in any other material. From the number of drawings given there would not be the least difficulty in preparing a general plan that would be sufficient to enable any client to realise its appearance.

PREVENTING GRANT OF CERTIFICATE.

A REMARKABLE case was heard by Mr. Justice Darling at Warwickshire Assizes, which was already before the court and was referred back from the High Court. According to the *Birmingham Daily Post* the plaintiff, Mr. Charles Hopbush, of Berkswell, sought to recover 143*l.* from Mr. Stanbury Eardley, solicitor, of Birmingham, which he alleged to be due on a building contract. The defence was that no architect certificate had been given for the sum claimed, and the plaintiff's reply was that the architect had been prevented from giving a certificate by the interposition of the defendant. The building in question was a cottage at Fen End, Berkswell. Mr. Stanger, K.C., and Mr. H. McCardie appeared for the plaintiff, and Mr. Hugo Young, K.C., and Mr. Norris Foster for the defendant.

In opening the case Mr. Stanger explained that it had been before Mr. Commissioner Forbes, and was referred to Lord Justices Romer and Matthew, who decided that as a question of misconduct was raised it was desirable that it should come before a jury. The allegation by the plaintiff was that the defendant interfered with the architect, Mr. Scruton, in such a way as to cause him to abdicate his functions as an architect. The contract for the work was for 255*l.*, and the architect gave a certificate for the first half of the amount, which was paid. After that Mr. Eardley more and more took the matter out of Mr. Scruton's hands, and indeed the architect did not go on with the building for a long period before he was asked to give the final certificate. That certificate was not given, and the reason suggested by Mr. Stanger was that the architect was afraid Mr. Eardley would bring an action against him if he gave the certificate. In support of this contention Mr. Stanger read extracts from a bulky volume of correspondence, in which repeated applications to the architect for a certificate were made by the statement that "a few things were required to be done by Mr. Eardley." Several appointments to meet the defendant and the architect on the ground were made but not kept. The plaintiff suggested that the giving of the certificate should rest with the architect and not with the owner, but he agreed to do

anything that was in the specification. But some of the defendant's requirements were inconsistent with the specification and could not be done. He did all that could reasonably be required. Mr. Scruton in one of his letters said he thought Mr. Eardley should give way in regard to an æsthetic defect in the porch, but suggested that the plaintiff should see the defendant about it. This, Mr. Stanger said, seemed to suggest that Mr. Eardley had inspired fear in the breast of the architect, and he would rather not see him.

The Judge: You say he was afraid of Mr. Eardley; not that he conspired with Mr. Eardley?

Mr. Stanger: I say that he abdicated his function as an architect. He refused to grant the certificate, although the work had been done to his satisfaction.

Mr. Young: One of the things not done to his satisfaction was the "bond."

The Judge: The "bond"?

Mr. Hugo Young: I mean the binding of the new work to the old.

The Judge: I thought you were referring to "The Merchant of Venice."

A discussion followed as to what Mr. Scruton meant when he wrote to the plaintiff, "When you have done this work I shall be in a position to push for your certificate."

Mr. Young thought it showed that the architect desired to induce the owner to waive his undoubted right to have certain defects remedied.

Mr. Stanger: I thank my friend for his ingenious and amusing interpretation, but I think it meant that Mr. Eardley would not allow him to give the certificate that the builder was entitled to, and that he would endeavour to induce him to give up this foolish, uncompromising attitude.

The Judge: I see now what "push" means. Each was pushing the other to the front when it was a question of going to see Mr. Eardley.

Mr. Stanger said the architect's refusal to give a certificate was dictated by the defendant, and was written because the architect was afraid it would be unpleasant for him if he gave a certificate. He asked the jury to return a verdict to that effect, leaving the precise amount to be fixed by someone who should go into the details.

The plaintiff went into the witness-box and stated that when he asked Mr. Scruton why he would not give a certificate he said, "Because of Mr. Eardley's interference." Mr. Pettit, of Foster & Co., solicitors for the plaintiff, said he asked the

architect a similar question, and Mr. Scruton told him that without Mr. Eardley's consent he could not give a certificate, as he was afraid that if he did so an action would be brought against him.

Mr. F. W. Hipkiss, an architect, said Mr. Scruton told him he was afraid of Mr. Eardley, who had threatened him with an action.

Mr. Hugo Young opened the defence by contending that there was no case to go to the jury. He quoted authorities to show that the condition precedent to the contract could not be set aside under any circumstances.

The Judge: I have the advantage of a judgment on this case. Surely if the defendant said to the architect, "If you give a certificate I will shoot you," that circumstance would justify the Court in setting aside the condition precedent.

Mr. Young then put the architect, Mr. Scruton, in the witness-box, and examined him with a view to showing that there was reasonable ground for withholding the certificate. The witness said the shortness of one arm of the roof of the porch, and the fact that the quarterings were an inch thick instead of $1\frac{1}{4}$ inch were æsthetic defects which might have been passed over. Where the defendant asked for a door frame there was no door, so he did not see that the frame was necessary. The crack in the wall was a serious defect. He did not notice any of these defects till Mr. Eardley pointed them out. Then he saw that the brickwork was not bonded in the way specified in the contract. He had a "legal fear" of Mr. Eardley, for he knew that if he gave a certificate while these defects existed Mr. Eardley could bring an action against him.

Mr. Eardley in his evidence stated that the cottage was not habitable for a gentleman. When the wind blew it rocked, and when rain fell it was flooded. Asked why he went to live in such an uninhabitable house, he said he had a child who was almost dying, and he was ordered to take it into the country.

Mr. Stanger: I believe that the child did not die even in this cottage.

Mr. Hugo Young: It only wanted the open-air treatment. Experts were called on both sides to say whether they thought the contract had been properly carried out.

Eventually his lordship put the following question to the jury:—"Did Mr. Scruton refuse to give a final certificate in consequence of the requirement by the defendant that things should be done by the plaintiff beyond what he was bound to do under the contract, and did he in fear of the defendant

refuse to give his final certificate, believing that the plaintiff was legally entitled to it?"

After retiring for a few moments the jury answered, "Yes."

Mr. Stanger then asked his lordship to put further questions to the jury, but this the judge refused to do.

HOUSING IN GLASGOW.

EVIDENCE was given by Mr. Thos. Binnie, a valuer with forty-five years' experience, before the Glasgow Corporation Housing Commission. According to the *Herald*, there were, he said, six reasons for the recent rise of rents in Glasgow. These were:—(1) A great rise in the wages of all operatives connected with the building trade; (2) a considerable rise in the cost of materials used in building; (3) the enforcement of building regulations to make buildings more substantial, and also more healthy; (4) an improvement in the size and character of houses of the smaller class; (5) the great increase in the burden of taxation placed upon property; (6) the increased cost of the upkeep of property. The rise in wages was from 66 to 100 per cent. between 1860 and 1902, and the average was 81 per cent. It was his experience that as wages had advanced less work was done per hour; therefore, so far as building was concerned, workmen were raising rents against themselves. On the whole, he estimated that the average increased cost overhead of building ordinary tenement-houses had not been less than 50 per cent. during the past forty years. Cost had been increased in consequence of houses being built more carefully under strict supervision. So far as we are making the buildings more substantial than we did before, we are going quite in the wrong direction. Any ordinary tenement built now will within 100 years be regarded as quite out of date. The really insanitary houses are those which have been built too strongly; they have lasted too long. Whenever ground becomes very valuable it pays the owner to take down these old insanitary houses and substitute business premises for them. Building regulations, so far as they prescribe thickness of joists, &c., are vexatious. These are things that should be left to the builder. No builder will put up a house unless it is sufficiently substantial. What is known in the trade as a 35-foot tenement contains 12,801 cubic feet, whereas in older tenements the same class of house would only contain 10,404.

The increase of accommodation in the new tenement was as 104 to 128, everything being equal except the size of the apartments.

Builders nowadays frequently proceeded in this way. They bought a large bit of ground at perhaps so low a price as 4s. a yard. They built a tenement on it, and when selling the property created a feu-duty which represented not 4s. a yard, but 1*l*. They sold that at a large number of years' purchase, but disposed of the building at cost price, or under cost. He knew of a case in which a profit of 8,800*l*. was made on the feu-duties, while the tenements were sold at 5,500*l*. less than the cost. The result was quite a moderate profit to the builder. The feu-duties were always a safe investment because of the security given by the buildings. It made no difference to the tenants whatever. He had ascertained from his old books the rates of rental in thirteen properties in different parts of the city in 1860. The lowest rent was 4*l*. and the highest 13*l*. Measuring these tenements over the walls and reducing the rents got on the first floor to a rate per square foot, he found that the average rent was 4 122*d*. per square foot. In 1870 the average rental for similar houses had risen to 4 45*d*. Last year the average rental in thirty-four properties was 5 225*d*. These were new properties with all modern conveniences. The lowest rent was 6*l*. 10*s*. and the highest was 16*l*. The increase between 1860 and 1902 was thus 26½ per cent. The increase between 1870 and 1902 was 17½ per cent. He considered it remarkable that the rise of rent had been so little, having regard to the increase in wages and cost of building. He accounted for it by the reduction in the rate of interest, and also from the fact that the builder was content with a smaller return than formerly. The return from property now was not more than two-thirds what it was when he began business. He knew no trade in which wages had risen so rapidly or to such an extent as in the building trade.

Money was lent on brick buildings in Glasgow. The Corporation in many of their buildings had only stone in front, all other walls being brick. Other builders had erected houses of the same class, and had borrowed money on them at the ordinary rate of interest. There was no increase of interest in respect of buildings of brick. There were many old buildings in Glasgow wholly of brick, and money was borrowed on them. He did not think concrete was cheaper than brick. His objection to concrete was that they were mainly dependent on

the constant care of the workmen in the quality of the work. A careless workman might spoil a job in a very few hours. He was aware of the proposal in Liverpool to use clinker and cement instead of brick, but that was in the experimental stage. There were a number of buildings in the West of Scotland of concrete—at Clydebank, at Hamilton and at Govan—but he did not think these experiments were successful. Concrete had of late been coming into favour for railway work, and possibly it might come into favour in connection with houses.

A stone tenement, well finished, could be built at about 4d. per cubic foot. In this climate people could not live in a house with the external walls only 9 inches thick. The late master of works—Mr. Whyte—and he had a conversation on that matter, and they arrived at the conclusion that, while the thickness of the walls might be reduced somewhat, it would be too cold to reduce them to 9 inches.

SIMPLEX STEEL CONDUITS.

THE 1903 Price List of Interior Electric Conduits, &c., just issued by the Simplex Steel Conduit Co., Ltd., of Birmingham, Manchester, and 20 Bucklersbury, London, is a handsome and compendious volume attractively leather-bound, and of a size and shape which render it very convenient for carrying in the

socket. It is copiously illustrated. Among the important improvements which the firm have recently introduced is their patent spring lid, which they are now fitting to most circular boxes, inspection bends, tee pieces, &c. These lids are

stamped from sheet steel, an $\frac{1}{8}$ -inch lip being formed round the circumference, which is made to fit accurately and spring tight into the top of the box previously prepared to receive it; firm pressure only is required to make a perfectly watertight and secure fastening, which can readily be removed for inspection purposes by the use of a small tool made for this purpose. Boxes fitted with this improved lid have the following advantages:—

Greatly increased available space owing to the removal of lugs. The use of screws is entirely dispensed with. A watertight and secure fastening is readily obtained. Labour is reduced to a minimum. Lids interchangeable, and no fitting required.

The "Simplex" special pendant fitting is another specialty of the firm. As will be seen from the illustration, the wires to which connection is to be made are bared and passed through slots in the terminals, and the other circuit wires pass on

through the centre arch in the bridge, which is of equivalent area to the conduit itself. Full descriptions are furnished of these and various other of the firm's specialties, such as their screw socket system, which enables their ordinary light-gauge conduits to be screwed with ease and safety, a late and most important development, allowing the system to be readily earthed throughout. Their porcelain interiors for con-

PROVISION AGAINST FIRE.

IN the City of London Court, on Monday, before Judge Rentoul, K.C., an action was brought by Mr. Charles W. Hutton, Penywern Road, Earl's Court, against Mr. F. G. Ensor, of Newgate Street, to recover 700*l.* for providing a fire-proof staircase. It seemed that the plaintiff was the holder of the residue of a lease granted in 1811 for ninety-nine years, at a rent of 233*l.* per annum, of premises now held by the defendant, who paid the plaintiff 850*l.* a year for them. As the defendant employed more than forty workpeople on the premises the plaintiff had been called upon by the London County Council to provide a fireproof staircase so that the workers could get away speedily in the event of an outbreak of fire. The plaintiff had had to pay 1,140*l.* for the cost of the staircase, and he now sought to have the defendant held liable for 700*l.* of that sum. The defendant urged that the plaintiff had sold the premises, and therefore he had no right to the relief asked for. The plaintiff admitted the sale, but added that at the completion he had to suffer a deduction of 700*l.* Judge Rentoul, K.C., thought that the justice of the matter would be met by judgment being given for 350*l.* and costs.

NATIONAL REGISTRATION OF PLUMBERS.

THE Council for Manchester District of the National Registration of Plumbers report that during the year 1902 fifty-eight applications for registration were considered by them. Thirty-one applicants—seven employers and twenty-four journeymen—fulfilled the conditions formulated at the Birmingham conference in 1900, and were accepted for registration without examination. The remainder, a master and twenty-six journeymen, were referred to the examiners. At an examination which was held in Manchester in May, seventeen obtained full certificates. Out of a prize fund raised by volun-

tary subscription the Council are this year providing prizes, consisting of books, to be competed for by plumbing students who are bona-fide plumbers' apprentices, and whose age does not exceed eighteen years, attending the technical schools at Manchester, Salford, Altrincham, Ashton-under-Lyne, Bolton, Bury, Chorley, Middleton, Oldham, Ramsbottom, Rochdale, Stockport and Todmorden.

After the formal business of the annual meeting of the Council, which was held on the 14th inst., a paper was read by Mr. J. Radcliffe, principal of the sanitary engineering department, Manchester, on "Various Methods of Preventing Scamped Plumbers' Work." Later the Council had a musical evening.

A Bill for the Registration of Plumbers has passed the House of Lords and the first reading in the House of Commons. The Manchester Council are at present engaged in obtaining signatures of plumbers to a petition to the House of Commons advocating the support of members to its second reading.

THE AUCTIONEERS' INSTITUTE.

THE last ordinary meeting of the session of the Auctioneers' Institute of the United Kingdom was held on the evening of the 13th inst. at Hamilton House, Victoria Embankment, under the presidency of Mr. John Hepper, of Leeds. There was a large attendance, and amongst those present were Dr. Heber Hart, Messrs. W. Bennett Rogers, W. R. Peck, A. W. Brackett, H. D. Buckland, J. Boyton, J. H. Lepper, W. R. Johnson, E. Pennington, F. Swain, P. H. Horton, P. Hodson, C. D. Levy, G. Pearce and C. Harris (secretary).

The President said they had met that evening to discuss what he thought was a subject of vital importance to their profession, and that was, "What should be the educational curriculum for auctioneers?" The committee of their Kent, Surrey and Sussex branch had set the provincial branches the excellent example of offering prizes for the best three essays upon the subject from the members of their branch, and it was proposed that the gentlemen who had won the prizes for their essays, which had been adjudicated upon by Dr. Heber Hart, should read them to that meeting. The prize winners were Mr. W. R. Johnson (Kingston-on-Thames), first; Mr. E. Pennington (Richmond), second; and Mr. P. H. Horton (Godalming), third.

The authors then read their essays, which were all of great merit. Mr. Johnson in his discourse laid particular stress upon the fact that the once popular idea that an auctioneer did not require any special education or qualification for the exercise of his profession was rapidly vanishing, and said that to all who gave consideration to the subject, it was evident that perhaps in no other profession was a diverse knowledge necessary, so varied were the matters which had to be dealt with. It might be said there was scarcely a subject which it would not be useful for him to have a knowledge of. It was, however, obvious that no one man could have such a comprehensive knowledge, and consequently it was necessary to specialise and to divide auctioneers into various classes—classes in which, technically speaking, an entirely different education was required. A youth having received a sound preliminary education, and passed one of the examinations qualifying for admission as student in the Auctioneers and Surveyors' Institutions, should then be articled to an auctioneer in good practice in the special class of business for which he had a preference. But the mere passing of these examinations could never make a man a competent auctioneer; that could only be attained by practical experience. In addition to that, a man to be successful required certain personal attributes—those of a pleasant and business-like manner, a considerable amount of tact which might be interpreted as "daring, and saying the right thing at the right time."

The President then distributed the prizes, and an interesting discussion of the various papers followed.

Mr. James Boyton, in proposing a vote of thanks to the chairman, said that, as a member of the Council, he was pleased to tell them that at the Council meeting held during the afternoon the number of new members elected had swelled the membership of the Institute to over 1,500.

BELFAST HARBOUR.

The Belfast Harbour Commissioners have decided on a new plan, which will have an immense effect on the shipbuilding industry and on the development of the port. The urgent necessity for a great graving dock for Belfast first came into prominence when the Atlantic Combine became an accomplished fact, and although the Harbour Commissioners had committed themselves to the construction of the work, decisive

action in the matter was deferred until the present time. Sir Daniel Dixon, Lord Mayor, pointed out that the Commissioners had yet to receive letters from the shipbuilding firms of Harland & Wolff and Workman, Clark & Co. in regard to the leases, and that both firms were willing to complete the leases. Belfast, his Lordship added, had now a great name for shipbuilding, and the present docks were inadequate to the present requirements. It must also be remembered that Belfast was getting a great deal of work from the Admiralty, and hoped to get more. Alderman S. Lawther said when the new graving dock was constructed Belfast would be above all other shipbuilding ports in the kingdom. The Commissioners then unanimously decided to proceed with the work on the completion of the shipbuilders' leases. The new dock will be 750 feet long, 96 feet wide at the entrance and 100 feet wide at the bottom. The depth will be 32 feet from the blocks to ordinary high-water level, and some 4 feet 6 inches will be allowed for the blocks. There will be a fitting-out jetty 600 feet long. The estimated cost of the entire work is 299,000*l*.

TECHNICAL INSTRUCTION IN HOLLAND.*

THE admirable *ambachts*, or trade day schools, are due entirely to local or private initiative. The first was established at Amsterdam in 1861, and they now number twenty. They have always been subject to Government supervision, but a special inspector was not appointed for them until four years ago. Their present popularity is such that proportionately they receive more State aid than the secondary schools. In addition to the regular Government subsidy, a special grant is made to the sparsely-populated province of Drenthe, where it has been found preferable to apprentice promising lads to competent workmen, rather than to found a distinct school. This plan was originated by a local Society for the advancement of education and has answered remarkably well.

The course at the schools usually covers three years, and is continuous throughout the year. The scheme of studies naturally depends to some extent upon the industrial character of the district, but as a rule it includes drawing, geometrical drawing, physics, mathematics, mechanics and wood and metal-

work, all taught technically and in relation to particular trades. In some cases instruction is also provided in masonry, furniture and instrument-making, painting and house decoration. The results are undoubtedly excellent. For a short time artisans were somewhat jealous of the trade instruction, but to-day there is an increasing demand amongst them for boys who have completed the school course. It is intended that pupils should come direct from the primary school, and this is the general custom. A few occasionally attend after leaving the higher burgher schools or the gymnasia. At three towns no fees are charged; elsewhere they vary from 8s. 4d. to 16s. 8d. per annum, but free places may always be had. All apparatus is found, and prizes are at times given, but on the whole it is considered inexpedient to encourage excessive competition. Those who follow the entire course almost always receive gifts of apparatus on leaving.

The total income of the twenty schools from private and public sources amounted in 1900 to 27,497l. 15s. The school at Arnhem may be taken as a fair example of what is done in a town of moderate size. The number of scholars in 1901 was 322, distributed as follows:—140 smiths, 95 carpenters, 37 furniture-makers, 32 painters and 18 masons. The instruction is given daily from 8 A.M. till 12, and from 2 to 6 P.M., except on Saturday, when there is a half-holiday. Wide-spread interest is evidently taken in the school, to judge from the numerous gifts of money and appliances to improve the instruction. An annual exhibition of the work is held in March; much of this is permanently on view, and many of the specimens, especially in furniture and decorative art, are first-rate, both in quality and design. The Commercial School, which was opened at Amsterdam in 1869, is attached to a higher burgher school with a three years' course. The object is to supply that technical training which is as essential for the distributor as it is for the producer, and which must have a foundation of wide general knowledge if it is to be efficient. The course lasts two years, and is well adapted for the future merchant or clerk. The value of this specialised instruction, following immediately after the three years in the secondary school, must be superior to what can be given in evening classes, where the lads are often too uneducated to profit by it. There is abundant evidence that this Amsterdam school, like other similar institutions in Holland, has won the confidence of the mercantile community, and it is wholly free from the artificiality of the Business Colleges of the United States.

TRANSVAAL FORESTRY.

AN address was lately delivered by Mr. D. E. Hutchins, the Cape conservator of forests, before the Transvaal Section of the South African Association at Johannesburg on "Transvaal Forestry." He stated that before the war there was a yearly average of close on 500,000l. worth of timber imported through Cape and Natal ports, and 140,000l. worth through Delagoa Bay, the larger part of this going through to the Transvaal; 500,000l. worth of timber came through Cape ports during 1901. Of this the greater portion was soft wood used in house building, and most of the balance hardwood sleepers. Return of timber imported into the Transvaal, 1897 and 1898:—1897: Manufactured, 258,741l.; unmanufactured 178,145l.; total, 436,886l. 1898: Manufactured, 217,447l.; unmanufactured, 130,013l.; total, 347,460l. During the last 21 years the Cape Administration had spent over 250,000l. on forestry. Timber was a necessity in a civilised country. Civilised man could no more do without timber than without air and water. It was not at all unlikely that the Transvaal during the next few years would require 500,000l. worth yearly of unmanufactured timber or lumber. Was this to be brought 6,000 or 7,000 miles by sea from Australia or Europe? Obviously the Transvaal could grow much of its own supply at good profit. The Transvaal forestry possibilities can no more be allowed to lie idle than its mines. The Transvaal has a forest-producing power which is many times that of Europe, and every month that is lost in putting this forest-producing power into action is a dead loss to the country. What is required at once is the demarcation of the forest reserves, that is to say the areas which will form the future national forests of the country, and the setting aside of funds, say, 100,000l. yearly to afford those reserves. After giving further details, the lecturer concluded as follows:—"Forestry should be regarded not as a branch of agriculture to be assisted by a benevolent government, but as a great public work of pressing necessity. We have seen how, on the most moderate computation, most kinds of timber can be grown at a profit of 400 per cent., and the present high price of timber reduced by two-thirds. The good soils and fertility of the Transvaal are proverbial in South Africa. Foresters' measurements show how powerful is the vegetative process in the Transvaal and how vast the wealth of its potential forests. The coal deposits are evidence of the rich vegetation of the past. And let us not forget the ennobling effect of forests, their fostering the love of the beautiful."

CABOT'S INSULATING & DEAFENING QUILT

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Fireproof, moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING

A fireproofing result infinitely superior to that obtained with sheet asbestos, and a practically perfect sound-deadening, can be achieved in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT"

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 11 : 0
Double Ply...	1 : 16 : 6	1 : 16 : 6
Asbestos ...	2 : 16 : 6	1 : 16 : 6

Bales containing 500 square feet of single ply, 250 square feet of double ply. Weights: Single ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to all other exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

in nature. Your coal is grimy, your gold is in the gloomy mines, but your forests should be the pastime and glory of your people, the health and wealth of your children."

INSTITUTION OF CIVIL ENGINEERS OF IRELAND.

At a meeting of the Council, held on the 4th inst. at Dawson Street, Dublin, Mr. John H. Ryan, president, in the chair, a quantity of routine business was transacted. A general meeting of the Institution was afterwards held, when Mr. H. Norman Leask, Assoc. Mem., read an interesting paper on "The Destruction of Towns Refuse and some of the Principles Involved in the Construction of Refuse Destructors." After discussing various insanitary methods of dealing with towns refuse, he pointed out that in the United Kingdom there are still some 800 towns of over 2,000 inhabitants without any means of disposing of the refuse beyond that of "tipping." Destruction of refuse by fire was adopted by the ancients, as shown by Biblical records and classical works. Fire was still employed in uncivilised countries, and, indeed, in several English towns the "everlasting fires" were still in operation on their outskirts, burning refuse in the open. The first authentic attempts to destroy refuse in a furnace dated back to about forty years ago, but were not successful owing to the fact that the furnaces employed were faulty in design. After discussing various destructors which had been introduced from time to time, he pointed out that there were practically only three systems in use to-day which tended to reduce the cost of labour below that of handling the refuse with forks and shovels. The first was patented by Messrs. Bulnois and Broide and adopted by Messrs. Manlove & Alliott, the second was that carried out by Messrs. Horsfall, of Leeds, and the third was that adopted by Messrs. Heenan & Froude, of Manchester. The modern forms of furnace were next discussed, and the lecturer concluded from various tables, which he submitted to the meeting, that the nearer the laws regulating combustion were adhered to the better the results would be. He then discussed at some length the construction of destructors, and explained the various uses to which "residuals" are put, amongst them being the manufacture of mortar, tiles, bricks, &c. Taking all things into consideration, it was, he argued, possible to erect a refuse

destructor which would be as good a sanitary medium as a well-planned sewage scheme. Further, if careful selection were made of the various types, it would be possible to erect a destructor that would not prove an additional burden to the ratepayers, but would represent a possible saving. To attain this desired end the heat value of the refuse must be utilised for some such useful purpose as pumping sewage or water or for the generation of electrical energy for traction purposes, and the "residuals" must be dealt with in a manner suitable to the demands of the locality.

PROPOSED ASYLUM AT HORTON.

THE asylums committee of the London County Council report that the number of lunatics for whom the county is responsible to find accommodation was on January 1, 1903, 16,961 (7,159 males and 9,802 females). The number of beds now provided in the London asylums is 16,379 (calculating on normal accommodation), 1,400 being in temporary buildings. There is, therefore, at the present moment considerable deficiency of accommodation after allowing for some 198 patients who have been transferred since the fire at the Colney Hatch Asylum to the Metropolitan Asylums Board's asylums. The average annual increase of lunatics in the county of London since 1890 is 527, but the average for the last five years is 576. An estimated yearly increase of 550 may therefore be taken as a reasonably approximate figure to be expected, in which case in four years additional accommodation for between 2,000 and 3,000 patients is required without taking into consideration the putting out of use of the temporary buildings. With regard to these latter the Commissioners in Lunacy are urging us to take steps to effect a discontinuance of their use at the earliest possible moment.

In these circumstances the committee recommend (a) that the Council, in accordance with section 239 of the Lunacy Act, 1890, do authorise the asylums committee to proceed with the erection of a new asylum on the Horton estate; (b) that the estimate of 97,210*l.* submitted by the finance committee be approved, and that an expenditure up to that amount be authorised for the following works in connection with the erection of such asylum, viz: foundations, 55,710*l.*; roads, 10,000*l.*; architect and quantity surveyors, 13,000*l.*; additions to the central station for the supply of electric current, 10,000*l.*; sinking well, 8,500*l.*

THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, March 10, Mr. J. C. Hawkshaw, M.A., president, in the chair, the papers read were "Recent Irrigation in the Punjab," by S. Preston, C.I.E., Assoc. M.Inst. C.E., and "The Irrigation Weir across the Bhadar River, Kathiawar," by J. J. B. Benson, Assoc. M.Inst. C.E.

The first paper described the Chenab Canal in the Punjab, and its development from a small inundation scheme to irrigate a portion of the Rechna Doab into a large perennial canal which would eventually command the entire tract between the Ravi and Chenab rivers. This was one of the latest irrigation schemes in India, and its chief feature was that it was mainly for the cultivation, by means of imported settlers, of an immense tract of Crown waste land, for which special arrangements were necessary, as the liability of Government to these settlers was greater than to irrigators in old communities. It was shown that in the latter case advice and assistance only were required, the villagers themselves constructing and maintaining the watercourses. In the former case it was necessary to assure a certain percentage of irrigation to each new settler in every crop. The manner in which the waste land had been blocked out and levelled so as to obtain an accurate contour map was explained, and a specimen of an irrigation map was given showing how a channel was constructed by Government to the commencing point of every holding. A description was given of the various works carried out by the canal engineer for the development of the tract and its transformation into a settled community, and a comparison was made between his work and that of a railway engineer.

The principles applied in aligning and grading all the channels of this vast system and of the calculation of their capacities throughout were described.

The responsibilities of the engineer for the maintenance of the works, the distribution of the water and the assessment of the Government demand were referred to, and reasons were given why it was considered necessary that the last two, which might be considered outside the ordinary duties of an engineer, should be entrusted to him instead of to a civil revenue officer.

The system of water distribution, both in the Government channels and the village watercourses, was described in detail, as well as the method of assessing the demand, and of settling any disputes regarding the amount of the claims formulated.

The duty of the water and the manner in which it was calculated, both for the whole canal and for the distributaries, were stated, while reference was made to the precautions taken against over-irrigation and consequent damage to the soil, owing to the anxiety of the cultivators to amass riches quickly.

The difficulties and anxieties of the engineers responsible for the distribution of the immense volumes dealt with in a canal of the kind described were referred to, and the paper concluded with a statement of the cost and financial prospects of the Chenab Canal.

The second paper described the construction of a weir intended to complete the reclamation and irrigation of about 80 square miles of low-lying land at the delta of the Bhadar river, which discharged into the Indian Ocean.

The present shore line appeared to have risen, enclosing shallow lakes, which had silted up by the deposit of mud brought down by river floods; but although floods continued to deposit silt on these low lands, the surface-level had not risen appreciably in modern times, owing to the salt rendering the soil so friable that in hot weather it was blown off the land in the form of dust by the high winds.

A dam 1,800 feet in length, constructed in 1895, had excluded the sea from the greater part of the Rann, and the weir described completed the reclamation, by permanently retaining the silt and preventing the formation of the dust.

The tidal part of the estuary extended for 14 miles from the sea, and the weir was situated about 1½ mile from the sea, where the river was about 600 feet wide. The weir was of very open character and offered but little resistance to the passage of floods; it was, in fact, a bridge having a floor or sill which was temporarily raised by wooden shutters to hold up the river water. The sill was only 2 feet above lowest spring-tide level. The weir consisted of 20 openings, each 24 feet in width, closed with shutters 8 feet in height, and one lock 20 feet in width and 11 feet depth over the sill. The arches were 25 feet in clear span and 10 feet in width. The whole of the lock abutment and the pier foundations were built on wells sunk to the rock; and owing to the difficulty of sinking square wells in clay and the unsuitability of circular wells, square masonry wells with rounded corners had been adopted. The method of sinking the wells was referred to and details of the sluices were given. The working of the weir was also described, and the paper was accompanied by tables of rainfall data and particulars of the cost of the works.

THE WEEK.

THE decision given by Mr. Justice LAWRENCE on Tuesday in *F. & E. DAVEY v. The Corporation of Gravesend* should be regarded as a warning by employers who wish to take the law into their own hands and summarily put an end to a contract. The plaintiffs agreed to build electric-lighting works for 7,094*l.* The conditions were exacting, for if the contractor failed in the due execution or performance of any part of his contract, then the Corporation were to have a liberty to determine the future performance of the contract by the contractor, and in that event the amount then already paid by the Corporation to the contractor should be deemed to be the full value of the works executed by the contractor, and no further sum should be payable by the Corporation to the contractor, whether for contract work or extra work; and the Corporation were to be at liberty to take possession of the plant and materials upon the works and use them for the purpose of completing the works, and all expense incurred by the Corporation in or about the completion of the contract should be deducted from any sum remaining in their hands or payable by them in respect of the works already executed; and that any disputes with regard to the execution of the works or materials used were to be submitted to and decided by the engineer. The engineer who prepared the designs was Mr. TRENTHAM. While the chimney-shaft was in progress dissatisfaction was expressed by the defendants. Mr. CRICKMAY, architect, was invited to report, and he said that much of the work was not according to the specification, while the chimney-shaft was not on proper foundations. The plaintiffs agreed to rebuild the chimney-shaft at an extra cost of 25*l.* Mr. TRENTHAM drew a certificate for 1,500*l.*, which was lodged with the town clerk. A few days afterwards he informed the contractors that the certificate would be retained, and then prohibited the execution of any new work until that complained of was set right. Subsequently Messrs. DAVEY were told that the Corporation had decided to stop the operations. At that time there was a balance of 2,300*l.* due to them, in addition to plant and materials left on the ground. They brought the action to recover 2,544*l.* as damages for breach of contract and seizure of plant. The defendants put in a counterclaim of 735*l.* for the extra cost of completing the works. There was the usual difference between the evidence of the witnesses. But it was agreed that the contractors should have been called on to remedy defects before they were forced to stop. Mr. Justice LAWRENCE commented on the absence of the engineer, for it was a question whether he did not allow the use of the materials complained of. In law the plaintiffs were, his Lordship said, entitled to the 1,500*l.*, with an allowance for tools and materials. The jury gave a verdict for the plaintiffs with 2,544*l.* damages, and a stay of execution was refused. Evidently what impressed the jury was the sudden stoppage of the works.

A FORTNIGHT ago, in referring to the Aldrington sewage case and the rivalry between Hove and Brighton, we expressed the hope that it would not lead to waste of money on useless works or law costs. The representatives of Brighton on the Intercepting and Outfall Sewers Board have come to the conclusion to have another and more costly contest, and this time in the House of Lords. The decision of Mr. Justice KEKEWICH was in favour of Brighton's views that Aldrington should not be considered a part of Hove or be allowed to use the common sewer. The Court of Appeal came to an opposite opinion. Mr. CRIPPS, K.C., and Mr. BOXALL, K.C., two of the counsel engaged on the Brighton side, have stated that in their opinion Mr. Justice KEKEWICH was correct in his interpretation of the Act of 1870 and the West Sussex, Brighton, Hove and Aldrington Order of 1893: that the decision of the Court of Appeal upon this judgment was erroneous, and that an appeal in the House of Lords would be successful. That opinion was enough to revive the drooping spirits of the Brighton members. A special meeting was held on Tuesday, when it was decided that an appeal be

presented to the House of Lords against the judgment of the Court of Appeal, and that the Clerk do, on behalf of the Board, enter into a recognisance of 500*l.* and make a deposit of 200*l.* as security for costs, as required by the Standing Orders of the House of Lords, and that he do retain counsel, solicitors and agents, and take all other steps necessary to prosecute the appeal. The Brighton people maintain that the execution of the works required would be injurious to the town as a holiday resort. As usual, there are a great many people who express their conviction that the judgment of the Court of Appeal will be set aside in the House of Lords. Would it not be better to realise that when the agreement was entered into the representatives of Brighton were not prophetically inspired and were unable to anticipate the progress of Hove? The outfall sewers have not the capacity to serve for an unexpected demand, and it would be more economical to permit engineers rather than lawyers to decide what is the best course for adoption under the difficult circumstances.

It was resolved by the Board of Management of the Manchester Infirmary on Monday last to accept the offer of the Corporation to purchase the infirmary site for 400,000*l.* The new infirmary will be built on what is known as the Stanley Grove site, which is to be acquired as well as any other property considered expedient. Plans will have to be obtained for the new infirmary. It yet remains for the decisions of the Board of Management to be approved by the trustees, who will meet for that purpose on April 3. There is, however, no anticipation of any difference of opinion, for the bodies have an equal interest in the success of the infirmary. The site now occupied is the most important in all Manchester, and should be utilised for a group of buildings worthy of the city. The designs will, no doubt, be secured as on former occasions through competition, and there is no question that when the announcement is made schemes will arrive from all parts of the country.

MR. STEWART HENBEST CAPPER, who for seven years has been professor of architecture in the McGill University of Montreal, was fortunate in being selected for a similar office in Owens College, which means that eventually he will be professor in Manchester University. The new professor is a Scotsman, and was a pupil of the High School, Edinburgh. Afterwards he studied in the university of Heidelberg. He is an M.A. of Edinburgh University, and he gained his degree with honours in Classical literature, winning also the Pitt Scholarship. From 1879 to 1884 he acted as private tutor and private secretary in the household of Sir ROBERT MORIER, the British Minister at Lisbon, and subsequently at Madrid. Having determined to follow architecture as a profession, he entered the *atelier* of M. PASCAL in Paris, and became a pupil of the Ecole des Beaux-Arts. On his return to Edinburgh he engaged in the practice of architecture. He gave lectures on the art in some of the towns, and held the office of examiner in archæology and the history of art for his university. He passed the examination necessary for election as Associate of the Institute in 1891. Professor CAPPER is in his forty-third year, and will enter upon his duties in Manchester in the coming autumn. His inaugural address in Montreal was published in vol. 56 of *The Architect*.

It was rumoured that the Campanile at Venice was not to be rebuilt owing to some difference between the municipality and the Italian Government. The report was inexact. By a recent agreement the appointment of Signor LUCCI BELTRAMI as architect to have charge of the important undertaking has received the approval of the Italian Minister. The municipality will contribute half a million of francs towards the expenses of the work, including the Loggia as well as the Campanile. A similar sum will be granted by the State, and a Bill with that object will be introduced in the Italian Parliament. It is considered likely that it will be necessary to expend money on some other buildings. Venice has undertaken to provide 300,000 francs for that purpose, and an equivalent amount will be given by the Government. Signor GAETANO MORELLI has been appointed Director of Venetian Monuments.

TYPES OF COSTUME: GRECIAN AND ROMAN.

THE ELIZABETHAN TERCENTENARY.

THE reign of Queen ELIZABETH came to an end on March 24, 1603. The Royal Geographical Society has utilised the opportunity afforded by the anniversary in order to demonstrate the extent of the knowledge of the globe's surface, which was one of the aspirations of that age. The position then attained by geographical science is suggested by ZUCCHERO's portrait of the queen, in which Her Majesty is represented standing on a map of England. What better symbol of authority could be devised? There is also a portrait of Sir WALTER RALEIGH by the same artist, having a map of Cadiz at the back. Much else could be referred to besides maps and atlases to reveal the gratification of Englishmen in the sixteenth century at finding there was so large a field open to their enterprise. On a globe made at the cost of WILLIAM SANDERSON, a fishmonger, the spirit of the time is expressed in the following lines:—

Lo, at my charge thou seest the ever-whirling sphere,
The endless reaches of the land and sea in sight appear,
For countries' good, for worlde's behoof, for learning's further-
ance,

Whereby our virtuous Englishmen their actions may advance,
To visit forraine lands where farthest coasts do lye,
I have these worlde thus formed, and to worlde's good apply.

The geographers, although we must respect their enterprise, should not, however, be allowed to monopolise the occasion. The reign of ELIZABETH was remarkable for the appearance of literature in a form that might be compared to the birth of ATHENE as a developed goddess, and also for artistic efforts which are still producing their effects. When the Abbé Du Bos in the eighteenth century endeavoured to explain the mystery of the low state of the arts in England in his time, he pointed out as an anomaly that the munificence of ELIZABETH during her long reign of forty four years was extended to every variety of virtù. The name of ELIZABETH is associated with vandalism by archæologists, and there is no doubt that as Head of the Church she issued injunctions and proclamations by which a great many Mediæval paintings and statues were destroyed regardless of their value in the history of English art. But the well-known story related by STRYPE of the conversation between ELIZABETH and Dr. SYMSON, the Dean of Her Majesty's Chapel, is enough to demonstrate that her own likings as an individual were in favour of examples of Christian art. The Dean obtained engravings and drawings which he introduced in a prayer-book, thus anticipating the illustrated Books of Common Prayer. He intended it for a New Year's gift to the queen. But on opening the book she "frowned and blushed;" then she abused the Dean for daring to suppose there could be any difference between her private inclinations and her public acts. Dr. SYMSON did not make sufficient allowance for a woman's variability. That, of course, was a misfortune, for historical painting, which was then confined to scriptural or legendary scenes, was proscribed, although there was a probability that it must have shared with poetry and other arts in the Renaissance of that golden age.

The painters who flourished at her court prove that ELIZABETH, although she might dislike representations of

saints, was very pleased to have as many portraits of herself as would do her justice, or, in other words, would represent her as a most beautiful woman. A royal proclamation was issued ordering that no attempts were to be made to exhibit her royal features without some sort of official approval and retouching. The queen would not sit to any but "special cunning painters." In other words, there was an aiming at an ideal which was advantageous to art. LUCAS DE HEERE, the son of an architect at Ghent, made a portrait of ELIZABETH in a rich costume and coming out of a palace with two female attendants. JUNO, PALLAS and MINERVA are introduced as retreating before so much majesty; JUNO throws away her imperial sceptre and VENUS her roses, while CUPID drops his bow and arrows and clings to his mother. That description enables us to realise the royal ideas of art. CORNELIUS KETEL also painted a portrait of ELIZABETH. ZUCCHERO depicted the queen in what was supposed to be a Persian costume, standing in a forest, with a stag behind her, while on the branches of one of the trees are tablets with mottoes and verses. MARC GERRARD of Bruges, another of the favourite artists, was more of a realist. One of his works represented the queen in a sedan on her way to Hunsdon House, Hertfordshire. In this picture the Earl of LEICESTER, Lord HUNSDON and Lord Treasurer BURLEIGH are shown. In one of DE HEERE's works the queen is seen with the sword of justice at her feet; in another she carries a fan with coloured feathers with a richly enamelled jewel by her side. NICHOLAS HILLIARD, her jeweller and goldsmith, was often permitted to paint her portrait, and must have introduced his own productions in abundance. ISAAC OLIVER was a pupil of HILLIARD, and, like him, was mainly in favour for his miniatures.

It is remarkable that JOHN SHUTE, who is the author of the earliest English book on architecture, "The first and chief groundes of architecture used in all the auncient and famous monyments, with a farther and more ample discourse upon the same than hitherto hath been set out by any other," is also reputed to have been one of the painters in miniature. He dedicated his book to ELIZABETH, and stated that he was sent to Italy in 1550 by the Duke of NORTHUMBERLAND and studied under the best architects. He would thus serve as a connecting link, if one were needed, between the arts of painting and architecture. It is not recorded, however, whether he prepared designs for any English building. ELIZABETH's surveyor, ROBERT ADAMS, was another architectural worthy, but it has yet to be ascertained if he designed any structures. The most famous of the architects whose names have come down to us was JOHN THORPE. He is believed to have been employed also in Paris by royalty. His name was "totally forgotten" when WALPOLE began his book, and it was revealed by the folio of plans belonging to Lord WARWICK. WALPOLE characterises THORPE's stately mansions as belonging to "that bastard style which intervened between Gothic and Grecian architecture, or which perhaps was the style that had been invented for the houses of the nobility, when they first ventured on the settlement of the kingdom after the termination of the quarrel between the Roses, to abandon their fortified dungeons and consult convenience and

magnificence; for I am persuaded that what we call Gothic architecture was confined solely to religious buildings, and never entered into the decoration of private houses." The consulting of convenience and magnificence to which WALPOLE refers must have been demanded by the condescension of Queen ELIZABETH in visiting the houses of so many of her subjects. Lady MACBETH expressed the sentiment of loyalty of the time when as hostess she received King DUNCAN:—

Your servants ever

Have theirs, themselves and what is theirs, in compt
To make their audit at your highness' pleasure,
Still to return your own.

The "progresses" of the queen were not intended solely as means of entertainment through novel scenes. While distant towards the nobles and courtiers, she sought the goodwill of the inferior gentry, and the visits to country houses enabled ELIZABETH by showing condescension to increase her popularity. At the same time she expected to be received in public with far more ceremony than awaited the meek DUNCAN at Dunsinane. It pleased her to be taken as a goddess rather than a queen. We referred above to a picture of the sovereign in which CUPID dropped his bow and arrow. A corresponding scene really took place in Norwich. A group of gods were supposed to have left Olympus in order to dignify the procession. At the command of the Mayor CUPID left them in order to present a golden arrow to ELIZABETH, as she could make it pierce the most obdurate heart. According to HOLINSHED the royal vestal, who had then lived in the world over half a century, received the gift very thankfully. Flattery of that sort was not confined to words. It would be necessary to have every house which had the honour of affording shelter to such a sovereign made as glorious as could be done by gold. At Hawstead there was a great stone figure of HERCULES set up in connection with a fountain, and on the pedestal was the date 1578. It is supposed to have been only one of the mythological embellishments.

It was no doubt to afford a space for the assembly of a crowd that in the building and remodelling of mansions various offices were removed to a distance from the main building in order that there might be a large courtyard. In SCOTT'S "Kenilworth," and in TIECK'S charming "Dichterleben," we have pictures of the gatherings on those occasions which are substantially accurate.

What BACON says about building expresses the spirit of the Elizabethan age. The general arrangement he divides into two parts, one for feasts and triumphs, the other for dwellings. He would have a goodly room above stairs at least 40 feet high, and under it a room for a dressing or preparing place at times of triumph. In various other ways we see the aiming at magnificence. Those suggestions were no doubt published after ELIZABETH'S death, but they are more related to her reign than to her successor's. Besides, we derive better information from them than from any of the topographers about the marvellous change which took place in building during that time. In one place BACON says:—"The opulency of the place such, as if you have respect, to take one sign for many, to the number of fair houses that have been built since her reign. As AUGUSTUS said 'that he had received the city of brick and left it of marble,' so she may say she received it a realm of cottages, and hath made it a realm of palaces." In another of his writings he declares:—"There was never the like number of fair and stately houses as have been built and set up from the ground since Her Majesty's reign, insomuch that there have been reckoned in one shire that is not great to the number of thirty-three, which have been all new built within that time, and whereof the meanest was never built for two thousand pounds. There was never the like pleasures of goodly gardens and orchards, walks, pools and parks, as do adorn almost every mansion house. There was never the like number of beautiful and costly tombs and monuments which are erected in sundry churches in honourable memory of the dead."

It is amusing to find that ELIZABETH'S objections to sculpture and paintings in churches was misinterpreted by some of her subjects, who believed she wished to substitute graven or painted images of herself. One story told by BACON is worth repeating. He says:—"The gate of London,

called Lud Gate, being in decay, was pulled down and built anew; and on one side was set up the image of King LUD and his two sons, who, according to the name, was thought to be the founder of that gate, and on the other side the image of Her Majesty, in whose time it was re-edified; whereupon they published that Her Majesty, after all the images of the saints was long beaten down, had now at last set up her own image up on the principal gate of London to be adored, and that all men were forced to do reverence to it as they passed by and a watch there placed for the purpose." Through absurd delusions of that kind sculptors have had to suffer for three centuries in England.

Although ELIZABETH was a factor in the erection of buildings, and her name has been given to a style, she cannot be considered as one of the great patrons of architecture. Only at Windsor Castle are there works which can be credited to the queen. Building could not minister to her vanity like painting. Besides, she found it necessary to be economical, and in spite of all her efforts could not escape financial embarrassments. Sculpture was not favoured unless we recognise goldsmiths' work by that name.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VIII.

CONSIDERATION OF ROOFS, SECTIONS, AND MODIFICATIONS IN PLAN.

IT has been well urged on various occasions that the roofing should be considered at an early stage, for unsatisfactory results are liable to occur otherwise.

Where for each successive point dealt with, claim is made for its early consideration, if, on a superficial view, this seems weak in any respect, it points nevertheless to the necessity for the architect to attend simultaneously (or as nearly so as possible) to all phases of the design, and to refrain consequently from attempting to settle any one detail conclusively until all the others have been adequately considered.

Before proceeding it is as well to utter a warning against all forms of affectation and pedantry, whilst insisting on the ethics of design. It is easy to formulate precepts, to urge the claims of truth in all its nakedness, and to condemn expediency as beyond redemption; and it is equally easy in so doing to overstep the boundary between good sense and affectation. Anything approaching falsity of expression, pseudo-symmetry or sham, is to be shunned of course; but, amongst other falsities, false prophets are met with, and it is necessary to beware of such as overdo their prophetic warnings.

The above remarks, though made at this advanced stage, have guided the writer *ab initio*, and should similarly guide others, in order to exercise a restraining influence in places where it may be thought that principles are being over-strictly insisted upon. The subject-matter of this chapter may now be considered.

So far as regards the upper portion of the elevation, the outline of the roofing should exercise an influence. For instance, where a "span" roof is carried through without "hipping," a gable forms a natural and pleasing, though not a necessary, termination; not, however, any gable, but one whose sides are inclined at an angle equal to that of the roof: that is to be screened. Again, a natural termination for a wall screening a flat roof would be a parapet, either solid or pierced, and for this reason, that such a roof might possibly form a promenade, or at least an outlook, where security must be assured, without obstruction of view. Hipped ends and the lengths of "span" roofs provide facilities for the introduction of "dormer" windows, whose contours are sufficiently numerous.

Whilst there cannot be any rigid scale fixed for parapet walls, and whilst, at the same time, a few extra feet of height may be tolerated when a better proportion is desired for the façade, yet there must not be any paltering with the treatment; a parapet wall should look its character, and such an expedient as that adopted by Sir CHRISTOPHER WREN for St. Paul's Cathedral is to be condemned utterly; it is shown in section in fig. 58. It is difficult to conceive any adequate

excuse, not for making the wall of such a height, but for treating it as a second storey. WREN has his apologists for this and other matters, and where, as in the case of his treatment of the western towers of Westminster Abbey, an apology should be needless (as the objections are of an affected nature), in the case of St. Paul's Cathedral an apology would be futile.

Everything else being equal, the roofing should help to emphasise the plan, instead of trying to disguise it; and

Sham Design in St Paul's Cathedral, London,
(from Quill's Encyclopedia)

FIG. 58.

this is not a mere theoretical argument, but one having direct bearing on a larger proportion of the buildings executed than might be imagined. With such a plan as shown in fig. 59, there are various methods of justifiable treatment,

Hypothetical Outline of Plan.

FIG. 59.

and some that are to be deprecated. To take one instance. The method shown in fig. 60 would be aesthetically incorrect and wanting in emphasis; if, instead of such treatment, the roof took the form shown in fig. 61, the plan would be emphasised, and the pavilion roofs would add dignity to the elevations.

Roof out of Sympathy with Plan.

FIG. 60.

Roof Emphasising Plan.

FIG. 61.

Again, the design shown in fig. 62 would be another method of treatment equally justifiable, and fully as pleasing in its nature as the last, though lacking some of the dignity.

The importance of this point in respect to roof consideration lies in the probability that the mere plan would not require these wing blocks, but that they would be introduced so as to justify a certain roof desired; this, at least, should be the case.

A certain plan may possibly suggest, in the first place, some definite section of roofing; but this will probably admit of modifications to suit the elevations should it be necessary, in order to avoid what may be termed *untidy roofing*, using this adjective merely in an æsthetic sense.

Flat roofs (not merely flat-pitched) may at times be advantageously introduced for part or parts of a building; but in the main they are not to be recommended, except where they may prove useful for fire escape purposes. From a utilitarian (as distinguished from an æsthetic) point of view there is more to be said in their favour, but to enlarge upon this would be out of place here.

Roof Emphasising Plan.

FIG. 62.

Mansard (or curb) roofs are effective in a majority of cases, and have the threefold advantage of gaining good headway for attics, throwing the water well off into the guttering, and producing a good appearance. Semi-circular and hemispherical sections are apt to look tame.

This quality of *tameness* is a pitfall that is easily fallen into, and should be avoided; angles of pitch giving 30 and 45 degrees are better set aside for ordinary span roofs; but for roofs such as in fig. 63, these angles are not

Where an angle of 45° is not tame

FIG. 63.

open to this criticism, at least, not to the same extent. It is not, of course, to be supposed that these and similar elementary angles (as they may be termed) are objectionable and tame *per se*; it is merely that experiment has shown them to be so in effect in a majority of cases.

But matters are on a different basis when the sphere or the circle is under consideration, for these possess an inherent *tameness*, due to an absence of variety, of visual contrast. Whether it is or is not a defect of nature need not be debated here; but the fact is that mankind is all the better for, and life less humdrum through, the agency of resistance, friction and contrast. This treatise not being a dissertation on natural philosophy, even a brief statement on the value of the forces of friction and resistance is debarred. Not so as regards contrast; this is the salt of design, and as such must be used with deliberation and discretion.

The figure that expresses the maximum of *tameness* is, not unnaturally, the one that shows the minimum of variety; that is, the sphere; and in gradation are to be ranked the cube and the equilateral pyramid. In a series of final ornaments, the "ball and base" treatment, such as the late EDWARD BARRY used in Victoria Street, London, proves wearisome in its extended repetition, and though possibly open to minor criticisms, "obelisk" finials would have looked better. This is at least only another phase of monotony, which is elsewhere dealt with.

A propos of obelisks, an illustration is here given (fig. 64) showing an effective use made of this form; similarly the monument erected in memory of SPEKE in Kensington Gardens, London, is pleasing in its simplicity and fitness.

When engaging on a scheme, it is proper to develop the plans, in the first place, so that all *essentials* of comfort and propriety shall be secured, irrespective of the effect on the elevations. With regard to the disposal of windows in the important façades, they may be omitted as far as possible from consideration in plans, until the design of the elevation is taken in hand; it is, however, a great improvement, as elsewhere noted, to give simultaneous consideration to plans and elevations. Section and plans must be developed side by side, and if the general scope of the

elevations is borne in mind from the commencement, any an modifications, rendered advisable for the benefit the elevations aesthetically, may be introduced during the solution of the scheme.

Memorial to Colonel Barksdon. E.A. HOFFMANN, Architect.

FIG. 64.

When the various storeys of a building have *through* levels in each case, the production of the elevations is simplified; but when the floors prove erratic, the *expression* should be given to this quality, and the various levels should be emphasised, instead of any attempt being made to introduce uninterrupted horizontal ruling.

(To be continued.)

NEW BOOKS.

IN the search for architectural examples of "The Georgian Period" in the United States it would be strange if the district of Georgia remained unexplored. We have recently followed the course of inquiry as far as Charleston. In the twelfth and concluding part of the American work (London: B. T. BATSFORD) the descriptions and illustrations begin with buildings in Savannah, which was founded in 1733 by General OGLETHORPE. Readers of BOSWELL'S "Life" will remember the General, for he was one of the few men to whom JOHNSON willingly acknowledged gratitude. He served against the Turks under Prince EUGENE, and from his ability no one could object to his looking down on MARLBOROUGH as a commander. He failed in Scotland and his military career was then at an end. It is of him the story is related that when a Wurtemberg prince cast a little wine in his face, OGLETHORPE, treating the insult as a jest, said in French, "That is a good joke, but we do it much better in England," and threw a full glass at the prince's features. An Irish duellist would have lunged the decanter. There is not much to be seen in Savannah which dates from OGLETHORPE'S time, for the city suffered from fire at the close of the eighteenth century. There are, however, numerous residences erected by an English architect named JAY. One, built in 1815, is constructed of "tabby," which is described as "a species of concrete or artificial stone composed largely of pounded oyster-shells." In the Savannah region there is much to recall England. The planters evidently believed there could be no dignity without columns, and they used them, both on exteriors and interiors, most liberally. They appear to have been indifferent to proportions, for the columns extend to unusual heights with little regard to their diameters. The names of some of the designers have been preserved. JAMES HOBAN, who won the competition for GEORGE WASHINGTON'S mansion, and afterwards con-

tinued in the Government service, was a native of Kilkenny, and was taught in Dublin. But the majority of them remain unknown. Their fate is taken as a subject for a little sermon to their successors:—

The architects of the present day are so possessed with the belief in their own unimpeachable value in and to the world of art that they seem blind to the fact that in this country there were architects before them; that these well-proportioned and delicately detailed mansions, which men and women of feeling now delight in, are the certain evidence of the existence of architects quite as truly artists as any of the architects of to-day whose income may be ten times as great. The fact that these honoured buildings are, generally speaking, the work of nameless men is but a reminder that, for all his braggadocio, the fashionable architect of the hour will himself be unknown to posterity and his name never associated with some possibly good and delicate piece of work of his that may have endured the wear and tear of ages.

It is remarkable that in spite of the stately examples before them the Americans should have become indifferent to architecture, and during the greater part of the nineteenth century erected houses suggestive of the transient position of most of the owners. With so much mechanical ingenuity it was allowable to imagine that an age of millionaires was looming, and until the happy time arrived temporary buildings must suffice. Then when the Georgian style was found to have architectural possibilities there was no such collection of examples available as Mr. W. R. WARE has provided. He is justified in saying, "For the lack of it, and through the imperfect understanding of the style which naturally grew out of this lack, the country has been endowed with a vast quantity of buildings, intended to express the spirit of 'Old Colonial' work, which, because of their ill-considered proportions and vulgar over-dressing with applied ornament, are too often mere caricatures of the style." It is sometimes supposed to be wise to keep the best wine until the end of the feast, and a like arrangement has been adopted in "The Georgian Period." The final division of the work contains a larger number of characteristic examples than its predecessors. The whole series will be invaluable for all in this country who are endeavouring to realise a similar problem to that of the colonial architects by employing Classic forms to meet modern needs in house-building.

Mr. WARE has also compiled the first part of a work which would have gladdened the architects of the Georgian period. It is apparent they were often obliged to follow inferior models of the orders. The "American Vignola" (London: B. T. BATSFORD) gives forms and proportions which mainly correspond with those published by VIGNOLA in 1563. They have been, however, adapted to the convenience of modern students. There is no confusing array of dimensions for the smallest details. The principal proportions only are figured, and all the others are philanthropically ignored. The book originated in the influence of the late R. M. HUNT. Mr. WARE says:—"I well remember the day when, as I was carefully drawing out a Doric capital according to the measurements given in my 'Vignola,' Mr. HUNT took the pencil out of my hand, and setting aside the whole apparatus of modules and minutes, showed me how to divide the height of my capital into thirds, and those into thirds, and those again into thirds, thus getting the sixths, ninths, eighteenth, twenty-sevenths and fifty-fourths of a diameter which the rules required, without employing any larger divisor than two or three." The book is well suited for the needs of students and will help to perpetuate the Classic tradition of proportion.

The fourth divisional part completing the first volume of "The Modern Carpenter, Joiner and Cabinet Maker," edited by Mr. G. L. SUTCLIFFE (The Gresham Publishing Company), has been completed. The work is folio size, and the large type and clear diagrams are at once suggestive of information that is valuable. No student having even ordinary interest in carpentry could slur over pages presented in so impressive a form. RUSKIN at one time considered his smallest books should be paid for at the rate of a guinea each, for he maintained that very cheap books are not prized by students, and there can be no doubt that a high character of production is an incentive to careful reading. In the part just issued Mr. SUTCLIFFE describes the theory

of stresses and strains as applied to wooden structures, the properties of timber, and the methods of forming joists and compound beams. The valuable investigations of Mr. FERNOW, of the United States Forestry Department, have been utilised, as well as tests by UNWIN, KIRKALDY, HODGKINSON and others. The subjects are treated with skill, and no more than a modest acquaintance with mathematics is required in order to understand the reasoning.

The third volume of Mr. RANKIN KENNEDY'S masterly treatise on "Electrical Installations" deals with "the several prime movers employed to convert heat energy into electrical energy, the heat-engine combined with a dynamo-electric machine being at present the only commercial generator of electric pressures." We are not able to see the tremendous force unless occasional sparks will serve. But of the elaborateness of the engines employed for its utilisation, there can be no question. On that account the practical electrical engineer is more and more monopolising the science. Mr. RANKIN KENNEDY concludes by affirming that research "has of late attracted fewer workers than it used to do before electrical engineering became a commercial profession. It is still going on, chiefly in Germany. Scientific research does not pay the searcher. There are many problems awaiting attack in electrical work, most of which can only be solved by patient scientific work without much prospect of monetary reward—the greatest problem of all being the direct generation of electric pressure from the fuel in which the energy is locked up." The third volume treats of storage of energy, and also of prime movers, including steam turbines, gas-engines and steam-engines, while the third part is occupied with electric generators and motors. The comprehensiveness of the book is manifest, and when it is stated there are over 200 illustrations of engines of various kinds, it will be evident that even a single volume of the work can become almost an expositor of modern practice. The author does not, however, propose to treat of engines to the fullest extent, for he says:—"The ordinary run of contracting electrical engineering—beyond the large municipal, tramway, railway and distribution in bulk systems, in which the larger powers are employed—consists of isolated plants in country houses, ships, mines and large factories, where the units are very rarely over 200 k.w. The large plants are in the practice of only a few firms, who are not likely to consult works of this nature in regard to engines and dynamos; we shall therefore only briefly refer to plants over 200 k.w. output." This restriction is likely to make the book more generally useful, for there is less likelihood of an engineer being deterred by descriptions of undertakings of a class which it may be long before he can obtain the chance of carrying out. Mr. KENNEDY is an inventor, and he has an eye for the weak as well as the good points in machines, but he is honest and outspoken, and his criticisms can be accepted with confidence.

Whatever may be the defects of the departments of construction belonging to the War Office, there is no doubt that the estimating and valuing of all elements of building, have been brought by the surveyors almost to the rank of a science. This is mainly owing to the elaborate schedules, which are as good a guide to the relative value of materials and labour as can be found. Since they are revised periodically, it is an advantage for an official to be able to point out from his own experience whether they are fractionally too high or too low. Annotated schedules are therefore remarkable documents, and a volume of them is a very valuable aid not only to a surveyor and contractor, but to architects who are not afraid of having it known that they take an interest in details of prices. Mr. J. T. REA'S "How to Estimate" (B. T. BATSFORD) is such a volume as a War Office surveyor would be expected to compile. But the author is careful to inform his readers that he "has endeavoured to approach London values," and that lately there is a constant fluctuation in the markets. In fact, all contractors who attempt varied tendering must possess data on which, through experience or some other cause, they place implicit reliance. In that way some of the differences between tenders can be explained, much else being attributable to the diverse methods of imagining difficulties as contingencies. Mr. REA has brought together a surprising quantity of genuine prices.

They might be obtained from price-books, manufacturers and builders; but what must have been more difficult discover was the time occupied in various classes of work. Unfortunately quantity is becoming as variable as price. Mr. REA says he found in the West Indies that economy of execution wholly depended on strict supervision of the negro. Strictness can be only partially attempted in this country, although it is much needed. Mr. REA'S book brought out at a moderate figure, and from its excellence entitled to a wide circulation.

"English Timber and its Economical Conversion," "Acorn" (London: WILLIAM RIDER & SON, LTD.), small in size, but it contains more practical information about timber than is found in some large volumes. The author does not confine his attention to the saw-mill. He describes the different classes of trees employed in the English markets, and gives suggestions to buyers. The pages are therefore not only serviceable for timber merchants, but for owners of plantations. It is needless to say that architects and builders will also find much that is suggestive.

GEORGE DANCE, R.A., and HENRY HOLLAND advise Sir JOHN SOANE to measure for builders, and from the amount of knowledge which he thereby gained he afterwards declared measuring to be the stepping-stone to professional knowledge as an architect. Other practitioners have taken an opposite view, for they consider surveying too analytical to be favourable to design. It is not even a member of the profession who is in a position to determine what he will do and what he will avoid, and the architect must be courageous who would declare his incompetency to take out quantities. The demand for instruction is shown by the late Professor BANISTER FLETCHER'S text-book on quantities having reached a seventh edition. It has been revised and enlarged by Mr. H. PHILLIPS FLETCHER, so that it now forms the most bulky of the excellent series of manuals produced by the same author and published by Mr. B. T. BATSFORD. There are several illustrations, and there is a new chapter on "Grouping." In spite of the competition the book upholds its reputation as a standard authority.

We have already given an abstract of the essay by I. ARTHUR LATHAM and Mr. A. W. WEST, which won the first prize in the competition for essays on "The Erection of a Sanatorium for the Treatment of Tuberculosis in England." There were 180 essays submitted. The essay has now appeared as a handsome volume issued by Messrs. BAILLIÈRE, TINDALL & COX. It would be superfluous to say anything about the merits of a work which gained so remarkable a victory. It can be recommended to architects who may be connected with the building of hospitals, and in all that relates to construction the information is precise.

CAMBRIAN ARCHÆOLOGICAL ASSOCIATION

THE Cambrian Archaeological Association has decided to hold its next annual meetings at Portmadoc, the environs of which are invested with exceptional interest to the antiquarian, there being the attractions of Beddgelert, Harlech Castle, Criccieth Castle, several very ancient churches, and plethora of cromlechs, tumuli, inscribed stones and other prehistoric remains. Mr. John E. Greaves, the Lord-Lieutenant of Carnarvonshire, has accepted the office of chairman to the reception committee, and Mr. Thomas E. Morris, of the North Wales circuit, and Mr. Charles E. Breeze have undertaken the duties of local secretaries.

At the first meeting of the reception committee at Portmadoc on the 20th inst., Mr. Greaves presiding, it was stated that the Association, which purposes making its visit in the third week in August, last visited the Vale of Madoc in 1860. The districts it was now proposed to inspect were Penmor Llanystumdwy and Criccieth on the first day; Harlech and Llanfair (the Roman steps), the second day; Treceiri, where excavations are now proceeding, the third day; and Beddgelert on the fourth and last day. The arrangements also provide that the president, Mr. R. H. Wood, of Rugby and Trawsfynydd, will deliver his inaugural address on the first night, and at the subsequent public meetings or during the excursions papers will be read probably by Professor Anwyl, Professor J. E. Lloyd, Professor John Rhys, Professor Keynes Meyer and Professor Boyd-Dawkins.

GLASGOW ARCHÆOLOGICAL SOCIETY.

MEETING of the Glasgow Archæological Society was held on the 17th inst., Mr. George Neilson, LL.D., presiding. Mr. Charles Taylor read a paper on "The Society of Friends in Glasgow and their Burial-Grounds." The Friends' meeting-house, he said, was situated in Stirling Square, North Albion Street. Worship was observed here from 1777 till they removed in 1815 to their present place of worship in Portland Street. From the beginning of the movement till 1815 the Friends had separate burial-places of their own. The Glasgow one was in Stirling Square, but was disused at the end of the eighteenth century, and the proceeds went to assist the erection of a meeting-house for the Friends in Edinburgh. Prior to the close of this burial-place in Glasgow were presented with another in Partick, this was used for 146 years, the last interment being in 1777. Another burial-place was at Shawtonhill, in the parish of Glassford, Lanarkshire, which was purchased in 1675, and was in use till recently, and still remained the property of the Friends. Another was at Gartshore, near Kirkintilloch, and was in use from 1674 to 1884. In recent years the remains of deceased Friends in Glasgow had been interred in the public cemeteries.

ROYAL SCOTTISH ACADEMY.

MEETING of the Royal Scottish Academy was held on the 18th inst. for the purpose of electing two associates— a painter and an architect. Mr. James Guthrie, president, was in the chair. The following were the nominations:—

Painters.—John Lochhead, West Kilbride, Ayrshire; Robert Brough, 259 Union Street, Aberdeen; D. Y. Cameron, 11, Stirling Street, Glasgow; John Bowie, 36 Torphichen Street, Edinburgh; George Stratton Ferrier, 41 Heriot Row, Edinburgh; Arch. Kay, 12 Berkeley Terrace, Glasgow; John A. Ford, 4 Picardy Place, Edinburgh; Thomas Blacklock, 108 George Street, Edinburgh; William M. Frazer, 6 Abercromby Place, Edinburgh; James Riddel, Caerketton, Colinton; R. Huddingstone Herdman, St. Bernard's Tower, Bruntsfield Crescent; J. Campbell Mitchell, Corstorphine; Mason Hunter, North Charlotte Street, Edinburgh; R. M. G. Coventry, 6 W. George Street, Glasgow; W. Skeoch Cumming, Queen Street, Edinburgh; John Henderson, 207 W. Campbell Street, Glasgow; George Pirie, Wardend, Torrance; George Smith, 47 Lauder Road, Edinburgh; Stuart Park, 8 Main Street, Glasgow; David Gauld, 46 Gordon Street, Glasgow; William Kennedy, 104 W. George Street, Glasgow; James E. Christie, 81 St. Vincent Street, Glasgow; Henry J. Gibson, 108 George Street, Edinburgh; James Kay, 35 Melville Street, Glasgow; Patrick Downie, Clyde View, Skelton; James Heron, 1 Warrender Park Crescent, Edinburgh.

Architects.—T. Duncan Rhind, 4 Duke Street, Edinburgh; James Miller, Glasgow; R. S. Lorimer, 1 Bruntsfield Crescent, Edinburgh; J. Macintyre Henry, 7 South Charlotte Street, Edinburgh; James B. Dunn, 42 Frederick Street, Edinburgh; James Ross, 42 Saxe-Coburg Place, Edinburgh; John A. Campbell, 44 West George Street, Glasgow; Alexander N. Robertson, 136 Wellington Street, Glasgow; T. S. Robertson, Dundee; T. L. Watson, 166 Bath Street, Glasgow.

As the result of the voting Mr. John Bowie, Edinburgh, and Mr. R. S. Lorimer, Edinburgh, were preferred for the honours. The final vote in the election of the painter associate was as follows:—Mr. John Bowie, 19; and Mr. D. Y. Cameron, Glasgow, 18. Mr. Robert Brough, Aberdeen, stood next. In the semi-final vote for the architect associate the result was:—Mr. Lorimer, 16; Mr. J. Macintyre Henry, Edinburgh, 15; and Mr. T. S. Robertson, Dundee, 14; and in the final vote Mr. Lorimer had 20 supporters and Mr. Henry 16.

Mr. John Bowie, says the *Scotsman*, is one of the rising portraitists of the city, whose work in recent years has received the recognition at the Royal Scottish Academy. A son of Dr. Bowie, Lauriston, Edinburgh, he was educated at George Watson's college. When seventeen years of age he began his career at the Mound, and entered the Royal Scottish Academy life school before he was twenty. In the first session he took the Chalmers bursary, and emerged from the school as one of the successful students of his time. A few years later he went to Paris, and studied drawing and painting in the ateliers of M. Bougereau and M. Fleury, and returning to Edinburgh began to paint with acceptance both genre pictures and portraits. To the latter branch of art he has of late more exclusively devoted himself, and with much success. Among the first portraits of his to attract favourable notice were heads of Mr. Albert Bach, the singer, and of the late Mr. Clark Gantton, R.S.A. He shortly afterwards was engaged on a large portrait group of the Edinburgh Town Council, which was bought and presented to the Corporation by the present Lord Provost. Many of the original studies for that picture, which is now hanging in the City Chambers, were much admired for their

incisiveness as characteristic likenesses and for their vigorous painting. Several of these heads were hung at the Royal Society of Arts exhibitions, among others those of the late Bailies Kinloch Anderson and Gulland and of ex-bailies Robertson and Macpherson and ex-Dean of Guild Miller. A large portrait group of the Royal Chaplains followed. Both of these works were engraved. Mr. Bowie has also painted and exhibited excellent portraits of Principal Story, Glasgow; the Rev. Dr. MacGregor, Edinburgh; Principal Rainy, the Rev. Hugh Black, United Free St. George's, Edinburgh; the Rev. Dr. Stewart, Lovedale; and Councillor Purves. At present Mr. Bowie is in Spain studying the works of the great portrait-painter Velasquez.

Mr. R. S. Lorimer is the youngest son of the late Professor Lorimer and brother of Mr. J. H. Lorimer, R.S.A. He was educated at the Edinburgh Academy and the Edinburgh University. He entered Sir Rowand Anderson's office as a pupil in 1887, remained there for four and a half years, then went to London as a draughtsman in the office of Mr. G. F. Bodley, R.A., the eminent church architect, where he remained for about two years. Another year and a half were spent in various London offices. He returned to Edinburgh ten years ago to superintend the restoration of Earls Hall, Fife, and to undertake some work that had been offered him by the late Mr. J. R. Findlay, of Aberlour. Since then he has been constantly occupied principally with domestic work in various parts of the country.

ST. BARTHOLOMEW THE GREAT.

ON last Saturday afternoon Mr. E. A. Webb, F.S.A., delivered a lecture on the changes which the ancient priory church has undergone from its foundation by Rahere to the present time. Mr. Webb dealt with Rahere's life in Rome, and the vision during his convalescence from fever which led to his return to England and the establishment of the church and hospital "in the suburbs in Smithfield." He himself was one of the Canons Regular of St. Augustine, generally called Augustinians, and his foundation consisted of thirteen canons, increased by Prior Thomas, who succeeded him in 1143, to thirty-five. The Norman church was the work of Rahere; the transepts, the crossing and the first bay of the nave, showing ornaments of the Transition period, were begun by Prior Thomas. The original nave, standing on what is now the graveyard, where some bases of pillars may be seen, was probably Early English. In the first decade of the fifteenth century extensive alterations were made. The lady chapel was rebuilt, with a crypt beneath. The original clerestory was replaced by that which now exists. About this time the tower was probably rebuilt, as the corbels of the west arch and the capitals of the Norman shafts on the north side have Perpendicular mouldings. To this period belong the tabernacle work and panels of the founder's tomb. Successive priors altered and modified the buildings; the oriel window in the centre arch of the Norman triforium on the south door and the door in the south ambulatory were added by Bolton, who built Canonbury Towers. After the surrender to the king by Fuller, the last prior, in 1539, the nave was destroyed, the present west front built, and the lady chapel and the conventual buildings sold to Sir Richard Rich. According to a document recently discovered in the Record Office by Mr. Webb, early in the seventeenth century the lady chapel was used as a dwelling-house. It was afterwards occupied as a fringe factory till 1885. The church was of very great interest, showing as no other church in London did the various architectural periods, and the restoration (commenced in 1863) had been carried out successfully. No one could mistake the new work for old, but the new harmonised extremely well in colour and style with the original. The special object of the lecture was to awaken interest in the recovery and restoration of three bays of the ancient cloisters, which are all that are known to remain. These adjoin the south wall, so that access could be gained therefrom through the original Norman entrance now walled up. These arches are of the fifteenth century, in a fair state of preservation, and their acquisition is very desirable. The other parts of the cloisters have been demolished to make room for, or been incorporated in, secular buildings. At the conclusion of the lecture contributions were received towards the purchase and restoration of the property, for which a sum of 2,500*l.* is required. The lecture will be repeated on Saturday next at 3 P.M.

The London County Council have resolved on the construction of a new asylum, to accommodate 2,000 patients, on the Horton estate, Epsom, at an estimated cost of 569,500*l.* An expenditure of 97,000*l.* on the preliminary work has been authorised.

NOTES AND COMMENTS.

It is sometimes difficult to discriminate between the varieties of machinery which will constitute "factories" under the Workmen's Compensation Act. There can be little doubt that a shed with an engine for grinding or mixing mortar would be a "factory," and the contractor who used it an "occupier" or "undertaker." But cranes and machinery for loading and unloading have caused some uncertainty. One of those puzzling cases was heard in the Salford County Court on Monday. The applicant was a bridge-builder's labourer, and he was employed in the widening of a bridge over the river Irwell. His work consisted in carrying water to the hydraulic "jacks" used for lifting the girders. The girders on being put into position were fixed by "drifts." The applicant was in the act of pointing out which "drift" required to be hammered in when another man raised his hammer and struck at it, the blow falling on one of the applicant's fingers. The injury was such that he had been unable to work since, and he claimed compensation. Plaintiff's solicitor argued that the "jack" was a mechanical appliance, and its power was provided by the entry of the water and air into a chamber. This power acted independently of the manual labour. His Honour Judge PARRY said it was an important question, when mechanical power assisted manual power, how far that came within the Act. He held that on the evidence before him this case did not come within the meaning of the Act. He was of opinion that the respondents were in the right, and would therefore make no order.

AMONG the modern French paintings which are known universally by means of photographs is the *Vierge Consolatrice*, by M. BOUGUEREAU, which for several years has been one of the most attractive pictures in the Luxembourg Gallery. The subject, it will be remembered, is the Divine Mother, clothed in black, looking upwards, while a young woman and a dead baby are prostrate at her feet. So much care has been taken with all the parts, and it is so difficult to do justice to the work in a small view; photographs are to be seen which only show the head of the principal figure, or that figure alone. The artist regards his painting as a whole, and although in reality it is a compliment to him, he does not approve of the selection of a part, but considers it as an act of injustice to himself. In order to test the question of control in such a case, M. BOUGUEREAU has taken an action against a manufacturer of Limoges, who has produced enamel plaques in which the head and bust of the Virgin alone are represented. As the picture is national property, the painter may not be able to control complete reproductions. But as he declares a part alone is incomprehensible from his point of view, he asks the Courts for protection. The case is under consideration.

WE mentioned last week the discovery of drawings which were falsely put forth as productions of the late M. PILLE. The inquiries by the magistrate resulted in a confession that the alleged author of the forgeries had made many other fabrications, and amongst them the tiara of SAITAPHARNES, now in the Louvre, for which 4,000*l.* was given. When the purchase was effected we had some comments upon it. But the crown, although made of gold and supposed to be Greek, did not captivate Frenchmen. As a consequence there was never any difficulty in seeing it in the gallery. Now that it is suspected to be no more than a modern sham it has become an attraction for all Paris. Whether it is old or new cannot be determined. A forger cannot have much respect for truth, and it is often of service for a man in Paris to make himself out a worse criminal than he is. Gold is a material easily manipulated, and if the most obdurate stones have been compelled to assume the appearance of antique gems a work like the tiara presents few difficulties to a fabricator. From the artistic skill which abounds in Paris it is always possible to obtain imitations of ancient styles for deceiving the unwary. So long as there is a superstitious affection towards what is ancient, and that people do not require to be convinced that all modern work is necessarily inferior to that of a past age, we must expect that crafty men will be found to pander to the infatuation.

THE recent numbers of *L'Art* contain many novelties. The liveliness of HORACE VERNET, the battle painter, is suggested by his amusing caricatures of the high and mighty architects and painters of his time. Students of SHAKESPEARE and of GOETHE will do well to enrich their collections with the reproductions of the famous lithographs by EUGENE DELACROIX. Facsimiles of letters form a feature in *L'Art*, and one is given by VICTOR COUSIN, the eclectic, in which we find him clamouring for a number of the *Edinburgh Review*, in which his philosophy was first explained to the world. The etchings continue to be as charming as ever. But *L'Art* defies competition, not only in the forms we have indicated but by its valuable "primes." The latest is *Marchande de Volaille à Cernay*, a large etching by LEON BOURGEOIS after the painting of E. DAMERON, which alone is worth a year's subscription.

STUDY FOR A TOWN CHURCH: SKETCH FROM SOUTH-EAST.

THIS design was one submitted in the recent R.I.B.A. competition for the Soane Medallion. The site, which is 140 feet by 90 feet, is at the corner of two streets in a large town. On reference to the plan it will be seen that, excepting a small area at the north-west corner, the whole of the ground has been utilised. The main object of the plan was to enable each member of the congregation to obtain a view of the high altar, and for this purpose the large uninterrupted areas required suggested the Byzantine style being adopted. The choir is arranged in a segmental form, and a return way for communicants has been provided. The morning chapel is placed at the south-west, having direct communication with the priests' vestry, which is at the south-east angle over site, and over which rises a campanile to a height of 171 feet to the crowning cross. The external design of the building depends entirely upon line and mass, and not on ornament, the interior decoration being in marble and mosaic. The study is by Mr. C. F. W. DENING, of Bristol.

PREMISES, TUDOR STREET (SOUTH SIDE), E.C.

THIS elevation was prepared by Messrs. BANISTER FLETCHER & SONS for the new publishing premises of the "Christian Herald" Company. The plan is very irregular owing to the peculiar nature of the site, and for this reason the staircase is placed to the front of the premises, and is carried up as a tower. The rest of the space on each floor is given up to the various departments of printing and publishing. As good light was required for this business, a simple mullioned treatment of windows was adopted. The floors were to be of fireproof construction. The front above ground floor was to be of red brick, the ground floor in Portland stone, and the roof covered with green Westmoreland slates. The rear of the premises overlooks the playground of the City of London School.

PREMISES, HIGH STREET, KENSINGTON, W.

THESE premises, forming No. 27 High Street, Kensington, have recently been erected, and consist of a music shop and practising rooms on the ground floor, the upper floors being occupied as flats.

The front has its boundaries recessed in the upper portion and a bay window taken up for the three storeys, thus forming a balcony on either side. The return walls have been treated with glazed tile panels representing famous musicians, by which means a certain amount of colour and interest is given to the façade.

The materials used are LAWRENCE'S red bricks and Kedon stone, and steel casements fitted with leaded lights for glazing. The builder was Mr. A. H. BIRD, and the works were designed and carried out under the superintendence of the architects, Messrs. BANISTER FLETCHER & SONS.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

On the motion of the President a vote of condolence and sympathy was passed to the relatives of the late Professor T. Roger Smith. He had been intimately connected with the Association, and many of the older members had passed through his classes.

House List, Session 1903-4.

The following were announced to be the principal officers:—President, Mr. H. T. Hare; vice-presidents, Mr. R. S. Balfour and Mr. Arnold Mitchell; hon. secretaries, Mr. H. P. G. Maule and Mr. H. Tanner, jun.; Mr. W. H. WHITE read a paper entitled

Ancient and Modern Town Houses; or, the Evolution of Domestic Architecture in London.

This title is perhaps too comprehensive for a short paper, and it should therefore be mentioned at once that only certain phases of the subject can be considered within its limits. Between its two headings, however, one sees in dim perspective much that is interesting in the gradual development of that class of buildings which, from the earliest grouping of dwellings for mutual protection down to such a vast aggregation of dwellings forming our modern London, has always been the nucleus from which, and around which, all other buildings have grown.

Once the walls of a fortified town were built, the ever-increasing number of inhabitants must have led up to the problem of getting as much accommodation in a limited space as possible, and limitation of space occurred in very early times, the result being that streets were narrow—mere alleys in most cases—and the picturesque timbered and plastered overhanging storeys which were built down to the time of the Great Fire added to the difficulties of properly lighting the houses, and also of access of air.

There is an interesting book entitled "The Evolution of the English House," by S. O. Addy, and there are four volumes upon "Domestic Architecture" by Turner and Parker, which trace the development of the house to the sixteenth century. Without dipping further, therefore, into the ancient history of town houses (although much that is interesting could be written thereon), we may take as sufficiently "ancient" the houses that were built in the seventeenth century, and then trace the problems that an architect had to solve in old days and has now to solve in these bustling times.

Starting from Wren and the impetus given to the development of the town house by the Great Fire of 1666, it may be noted that from that time to the middle of the eighteenth century there does not appear to have been any radical change in the type of plans adopted for the various classes of houses. By "classes" is here meant the small-sized town house, the middle-sized (both in terraces), and the town mansion. Of the first and second types there are few examples extant earlier than the eighteenth century, and of the mansions also, owing to the numerous alterations which have taken place, not many of these remain as first designed. But, dating from the middle of the eighteenth century, we have innumerable examples of three types, and upon examining them in detail, we shall find the same faults recurring through each, and, let us hope, the elimination of these faults to a great extent in present-day work.

It appears to have been the rule to have spent whatever time and thought was given to the planning of houses, until quite recent times, to the ground and first floors—the basements and upper floors being fearful and wonderful. It was all for "my lord and lady," and let the serving men and women shift for themselves; "live, and be thankful," was thought good enough for their motto, and they accepted the situation. The reception-rooms having been planned, the bedrooms, children's and servants' apartments had but little attention bestowed upon them, and were most frequently badly lighted, badly arranged and low in height. It is extraordinary why the early builders could have ever willingly burrowed down into the earth and increased their difficulties as to lighting and draining to such an extent.

No special scheme of house building appears to have been laid down prior to Wren's time, and his plan for rebuilding London after the Fire was not carried out according to his ideas. Yet he and Hooke, who had also made a plan, and who, owing to their appreciation of it, had been appointed surveyors to the City by the Corporation, were informed, were much overworked in setting out the rebuilding schemes. In 1668 Pepys describes a fire in Mincing Lane—a detached house "not yet quite finished, and the benefit of brick was well seen, for it burnt all inward and fell down within itself, so no fear of doing more hurt." Apparently, also, the jerry-builder was to the fore in the rebuilding, as our friend, Pepys, tells

us:—"I hear (1668) that there is fallen down a new house, not quite finished, in Lombard Street, and that there have been several so, they making use of bad mortar and bricks." From this time almost to the end of the seventeenth century no building schemes of any special note can now be followed with any advantage, so many alterations having taken place.

Wren must have had so much to do in his official capacity upon St Paul's and in designing sixty City churches with a few other trifles, that we can scarcely trace his influence or that of any other architect in the ordinary terrace house plan, although the traditions of his school of work can be seen in numerous instances. It is on record that he built a mansion for himself in Great Russell Street, but Elmes states that in 1823 "its noble front with majestic cantalever cornice was taken down by a speculating builder and common Act of Parliament fronts run up for four houses in its stead."

In the eighteenth century a vast quantity of houses were erected in London, and most of the principal residential squares and streets were laid out or rebuilt, with the exception of portions of Belgravia and practically the whole of South Kensington, this being nineteenth-century work.

Devonshire Square, City, was laid out between 1620 to 1670, but rebuilt later. Finsbury Square was laid out by the younger Dance in 1777, and was the first public place in London lighted by gas. Finsbury Circus was built in 1814; its glories have departed and huge blocks of offices have taken the place of most of the fine old terrace houses. Bloomsbury Square was laid out in the seventeenth century, but rebuilt during the eighteenth and nineteenth centuries. Grosvenor Square, although laid out in 1695 by Kent, has been rebuilt to a great extent, and was "the last square lighted by gas." Cavendish Square was commenced in 1717 and 1718, but building was then checked by the bursting of the South Sea Bubble, and this square remained in an unfinished state for many years. James of Greenwich was the architect of the two fine houses still in existence on the north side and which are fine examples of Wren's school.

The Brothers Adam built the Adelphi in 1768, some houses in Mansfield Street in 1768, Portland Place in 1778, a terrace of houses in Fitzroy Square in 1790-94, and as these are stone-fronted they appear to have seen that their favourite "stucco" was not all that could be desired. Portman Square was begun in 1764 but was not finished until twenty years afterwards, and was then described as "on the outskirts of the town, approached on one side by a road, unlit, unpaved and inaccessible by carriages." This brief list of dates gives us a rough outline of the history of the laying-out of some of the principal squares and terraces of houses built during the eighteenth century.

It is a matter for reflection to trace in the evolution of town houses how the trend of fashion has moved westward—and here it may be interesting to note that in most towns the fashionable quarters are in the west—and "fashion" for centuries past in London has ever moved westward. We are told that "the first emigrations of the London merchants westward (who used to live over their shops) was about the middle of the eighteenth century, and only those who had secured large fortunes and possessed reputations beyond the shadow of a doubt ventured as far as Hatton Garden."

We may now consider the work done in the nineteenth century to meet this westward movement and soon discover that the speculator was again to the fore. Regent Street and Regent's Park were laid out by John Nash from about 1812 to 1820. Belgrave Square was built in 1825 from designs by George Basevi, and Eaton Square by Cubitt in 1827—"Cubitt built" being (long afterwards) a sufficient guarantee for well-built houses. This term is used advisedly, as, alas! there is much to be deplored architecturally. From that date to the work done upon the Grosvenor, Cadogan and Queen's Gate estates (dating from about 1880), there is not much to interest us.

A very large amount of rebuilding has taken place upon these estates during the past twenty years, and fortunately a great deal of it has been done by some of our leading men, and here can be seen the work which must go down to future generations as some of the best town house work done during the latter part of the nineteenth century.

There is a considerable variety in the plans and elevations, and the development shows the reaction from the Portland Place and Harley Street terrace type. There is, no doubt, much that is charming in some of the new work done upon these estates, but whether the endless variety and "inconsequence" of many of the designs has not been produced at too great a sacrifice of dignity is a very moot question. This restlessness seems to be characteristic of the age, and it is interesting to speculate as to what would now be done in the designing of a row of terrace houses or a good "square," say by Mr. Norman Shaw, judging from the gradual development of his work from "Craigside," with its infinite variety and charm, and the dignity and reserve shown in his final masterpiece, "Chesters." In the corner house in Queen's Gate, also by Mr. Norman Shaw—although we are told he was given a cue

as to what was desired by the owner; yet it is well worth noting that after a long series of buildings thoroughly English in feeling, yet entirely fresh in grouping and with detail all his own—we find him at the close of his professional career reverting to severer forms and detail, allowing scale and proportion to take the place of picturesqueness, and really going back to the time when English architecture ceased to be a living style—viz the early Georges.

Until that time there had been a gradual development, a real following-on of design and adapted to the requirements of the age. Since that time we have been ringing the changes on the Greek Revival, the Gothic Revival, and latterly rushing to the Continent and coming back with sketch-books filled with innumerable "bits" to be grafted on to the next new work. But it is most interesting to see (as is apparent in so much that has been done during the past ten years) that the tendency is to return to our vernacular; to pick up the threads and to carry on the traditions of our own work, and surely it is worth while that our students should pause and study this reaction before struggling to invent new forms. By the way, does this not often mean amorphous lumps of brick and stone with conventional orange trees growing over the fronts of buildings and bearing fruit in the most extraordinary manner? This, however, is not a paper on "Architectural Styles," but the foregoing remarks are the outcome of studying the elevations of the houses we have been reviewing, and it need not be assumed they are suggested with a view of checking individuality or variety of detail, for it may be noticed that although "style" has been kept in the Queen's Gate house by Mr. Shaw, individuality is also impressed upon the design—internally more than externally perhaps.

These thoughts take us back to the works of the Brothers Adam, who, while adopting the characteristics of the vernacular style, impressed an individuality and refinement of detail on their work which does not appear to have been attained by any architect since. Examine the illustrations of their work and the skill in the "design" of their plans, the symmetry, proportion and refinement of detail in their decorations, and remember that they could and did treat their decorations architecturally; each reception-room and hall and staircase being separately studied and treated—walls, ceilings, floors, chimney-pieces, windows, doors and even the window and door fittings and the furniture were designed in the same style and scale as the house and with the same delicacy of detail. The fenestration in the work of the Brothers Adam was designed to show the relative importance of the rooms, but (with the exception of the drawing-room floor) the windows in many cases were too small to properly light and ventilate the rooms; it is curious they failed to realise the great defect which a centre pier between two windows produced as regards the effective lighting of a long room end on to the front. This applies to their London town houses of the ordinary terrace type. Adam Brothers' best work can be seen in their detached mansions, where their skill in the grouping of fine suites of apartments and for producing grand vistas and effects can be seen to most advantage.

The question of fenestration, formerly the keynote to the design and proportion of house fronts, seems in much of the work now being done to be relegated to the background, if not indeed forgotten in the craze for novelty of arrangement regardless of the position or needs of the rooms. The lower rooms, although requiring large windows in proportion to their size (particularly in narrow streets) are frequently too small, whilst the upper floors are over-windowed, and the desire for variety is allowed to dominate the whole character of the front. This criticism applies to town house architecture, not blocks of flats, where each floor is almost of the same importance.

The Brothers Adam were individualists and, to a very great extent, the characteristics of their work died with them, to be revived, so far as internal decorations are concerned, a century after their great work was ended. In the house, No. 25 Portland Place, said to have been built by Robert Adam for his own occupation, we have a good specimen of their work.

The work of John Nash had none of their refinement of detail, although certain qualities of his work, viz. breadth of effect, grouping and balance are well worth studying. Had the terraces of houses in Regent's Park which he erected (Cornwall Terrace was designed by Decimus Burton, but the same feeling exists) been faced with stone instead of stucco, the effect now would impress us in quite a different manner. Indeed, a walk round Regent's Park might convince the sceptical that breadth of effect may yet be obtained with a considerable amount of variety, and there is an element of repose and dignity about these terraces sadly lacking in the work now in general vogue; but this must not be confounded with the deadly monotony of the rows upon rows of stuccoed monstrosities of the Cromwell Road type: "Stuccoed and usually also porticoed, and bearing a gloomy likeness to an array of family vaults awaiting their occupants," as Mrs. Cooke in "Highways and Byways in London" recently said.

Until some of our prominent estate owners make the opportunity by dealing with blocks of houses at a time instead of solitary slips, there appears little chance of any change from the kaleidoscopic effects in our streets which our present lack of system and scheme produces. On the Grosvenor and Cadogan estates, although much good work has been done, yet designs "jostle" each other.

In dealing with recent work it is difficult to differentiate between the characteristics of the plans of various architects, and it would be necessary to devote a special paragraph to the work of each man to bring out these points, but a study of the plans which have been published shows that in later years much has been done to give greater individuality to the plans of even ordinary terrace-houses than was formerly the case; but a writer has truly said that "except in the minority of instances town houses are not built by the men who inhabit them, and in rarer cases still it is where ground values and questions of light and air do not entirely overrule the æsthetic influences of architecture itself." Indeed, most of the best modern work is that which has been done by architects for special clients to meet the latter's particular requirements; further, the site and its surroundings in many cases dictate the general laying-out of the plan. Aspect must also be considered as far as possible, even in smoky, murky London.

Planning is perhaps not quite so interesting to students as designing the elevations, and yet the importance of the plan cannot be over-rated, and the art or science of planning, as shown in the works of the best masters, is a very different thing indeed from that which comes from less able hands, and most certainly does "count."

Having received instructions to build a house in London—say, upon the site of an old one—the architect should study as far as possible the client's mode of living, his "hobby," and the accommodation he requires, and must not forget that "cost" will enter largely into the question and enhance his difficulties. Further difficulties may then present themselves in the shape of Acts of Parliament and London County Council by-laws, and neighbours' rights (invested interests), if neglected by the architect, will probably land him and his client into sad trouble and worry. In building upon a large estate other difficulties may be presented. The owner's and his surveyor's views require special attention, and with the popular cry against the ground landlords and their desire to meet their tenants in some instances and otherwise, sometimes compromises have to be made, and the architect's hands are by no means unfettered.

We will now consider the planning of town houses more in detail, and it may be as well to mention that the detached town mansion is not dealt with in this paper. It is in itself a sufficient subject for a very interesting discussion, but general principles can scarcely be laid down when conditions and requirements are so varied.

In the modern town house of the terrace type, whether the frontage be 20 or 30 feet, the problem is much the same—that is, the same number of rooms, in a given locality, will be asked for, the keynote being the relation of the hall and staircase to the rooms.

Of the "Adam" type, two examples exhibited show very well the charm of their work and their faults, judged by present-day requirements, and as indicating how much hinges upon a small point it will be observed that the sanitary block is in both cases at the extreme end of the ground and first floors, and approached only through some of the principal rooms. Upon examination of the Cadogan estate, Queen's Gate and Harley Street plans, now exhibited, it will be seen that modern ideas as to the position of the sanitary block have completely changed this type of plan.

Most people want to enter their rooms direct from the hall or corridors, and that the rooms be not "passage" rooms from one part of the building to another. There is a tendency (upon restricted sites) to omit the morning-room, and to enlarge the hall and make it more like a room. There is no doubt a considerable charm in this type of plan, and where the staircase is well treated and is not allowed to take up too much room, the hall becomes a useful lounge. A good fireplace is essential if it is to be so used, and well-arranged radiators materially add to the warmth and comfort of the house. If a staircase from the basement to the outer hall can be obtained, the inner hall is less liable to disturbance by the entrance of servants.

Such a plan often permits of side lighting from an area which is most desirable, but usually the space given up to the area is not sufficient—the air is stagnant and very little light is obtained, the result being again unsatisfactory. If "pairs" of houses can be built the areas become double in size so far as light and air go, and this is a great gain to both houses.

The usual "Adam" staircase is top-lighted, and although in many cases this has been effectively treated, the great defect is a gloomy hall. This can in some cases be avoided, and in a Harley Street house a window has been introduced upon each

half-landing in addition to a good lantern light, thus flooding the hall and staircase with light and giving ample ventilation, which is not to be obtained by the merely top-lighted staircase. This is a simple solution of the problem, and might be more often adopted with advantage. It breaks up the long shadows cast by the upper flights of stairs and landings, and gives a sense of brightness and airiness which has proved attractive. There is another determinant as to the position of the staircase, and that is the planning of the drawing-room, *i.e.* first floor. If double or connected drawing-rooms are required the staircase cannot be taken up between the rooms in the ordinary 20 feet to 30 feet frontage; if, however, connected rooms be not required, and the site is sufficiently deep, a central staircase, lighted either from the top or from an area, or from both, can be obtained, and examples of this type are worth studying.

A second staircase should wherever possible be provided—in the smaller houses, of course, it is not possible—and its substitute, although sometimes practicable, is expensive—it is a small passenger lift. But unless this can be worked by electricity and arranged to be used without a special attendant it is not of much use. Whilst dealing with the position of the staircases the relation of same to the kitchen is of great importance. In some of the old plans the service appears to have been almost lost sight of, and the labour to the servants must have been immense, and would not be tolerated by the present-day domestic servant.

The diagrams exhibited have been prepared from published plans or works actually carried out—in most cases show therefore that the position of the hall and staircase settles the general lines of the plan, although capable of much variety in detail according to the skill of the planner and the possibilities of the site.

In the smaller sized house it is not always possible to have a central or even an important staircase, but a well-designed one adds to the character of the house, and the very ordinary straight flight may be varied by reversing the bottom steps—and thus, by a little contriving, a position is secured for a fireplace and the ordinary "passage" effect is avoided. The rooms upon the ground floor usually required are a good dining-room (and remember that 15 feet in width is the minimum for comfort), a library and morning or own room, and a billiard-room is now more often asked for than formerly. If space be limited upon the ground floor a billiard-room can often be devised in the basement, but in such cases a staircase separate from the servants' stairs should be arranged so that access can be obtained without passing through the servants' rooms. The gentlemen's water-closet and lavatory should be upon the ground floor and well screened. Passing to the drawing-room floor, we have to decide whether there are to be two drawing-rooms or a single drawing-room and boudoir, with perhaps a guest's bedroom. For the ordinary house a large drawing-room, with smaller back ditto with large doors between and a small boudoir, is a very useful arrangement. If possible a water-closet and lavatory should be provided upon this floor if a well-screened position can be discovered. If a guest's bedroom be planned upon this floor a dressing-room and bathroom and water-closet is very desirable, and unless space prevents should be arranged. The second floor is usually given up to the heads of the family, and ordinary requirements demand a good bedroom with dressing-room (large enough to use as an extra bedroom), bathroom and water-closet, and one or two smaller bedrooms.

The principal staircase can sometimes with advantage terminate on this floor, and the back staircase become the staircase to the upper floors; but it should in such a case be well arranged and of more importance than the ordinary back stair. The drawback to this plan is that it becomes common to the family and servants. A skilful planner can often solve this difficulty, however.

The third floor usually follows the arrangement of the second floor. If there are children to arrange for, then special planning is required, and the accommodation should consist of a large day-room, two or three bedrooms, bath-room, water-closet, nursery pantry with sink, small larder, linen store, and plenty of cupboard accommodation—and a lift in this case saves much labour. On the fourth floor the servants' bedrooms, box-room, cistern-room, and, if possible, isolation-room, should be arranged, with easy access to the roof and from there to adjoining roofs in case of fire.

Descending to the basement, let us first glance at the plans of some old houses and compare them with those of recent date, and try and discern the reasons for the development. It is a mystery that with the drainage arrangements which existed (or the lack of them) down to quite recent times, that the death rate of London has been so low. It was until quite recently a common occurrence for the drainage to go into loosely-formed brick channels, very close to the underside of the basement floors and leading to cesspools constructed right under the houses; and in dealing with old houses close search should always be made for open-jointed pipes laid in brick drains, and cesspools disused, but full of foul matter.

As previously mentioned, it appears as if no careful study were made of the planning of the basement in the old houses—masses of brickwork, long dark passages and recesses abound, windows were absurdly small; it seems almost impossible that servants could have lived under such conditions; the very defects of planning increased the staff required to do the work of the house, for dark rooms and passages are almost synonymous with dirty rooms and passages. Many of the old examples show that the position sometimes selected for the kitchen was about as far from the dining-room as possible, and lifts were not then in use. The water-closets shown in a well-known book lead out of the men-servants' bedrooms, and in many of the Harley Street houses as originally planned, the water-closets were against the party-wall and without a ray of light, and no outside ventilation was possible. These defects, together with the old open-jointed drains and cesspools, were, indeed, strange and awful combinations. The examples are typical of hundreds of such cases which existed until quite recent years, and, indeed, are not yet extinct.

The difficulties of the older architects were increased by the necessity of providing laundries and bakehouses, which were often placed in the basement. Steam laundries and bakeries have helped to solve these difficulties, and we are able to concentrate and centralise the work and service of the basement to a very great extent. No part of the house will pay better for able planning than the basement.

It will not be necessary to describe in detail the rooms required in the basement, but only to insist that their proper relation to each other and to the upper rooms is of the utmost importance for the economical working of the house. It was time that the old order gave place to the new, and that the comfort and welfare of the servants be taken into consideration, for without such consideration the comfort of the owners and occupiers must certainly be lessened and an abnormal staff of servants will be required to do the housework.

The problem of how to adapt old houses such as are here indicated—to bring them, in the words of the house agents, "modernised up to date"—is one often presented to the architect, and it may be useful to note how such problems have been dealt with quite recently.

By studying carefully how to concentrate the service, by rearranging the rooms, by enlarging the window openings, obtaining borrowed lights and glazed doors wherever possible, many of these old basements can be made light, easy to work and perfectly healthy; but it is not a task to be entered upon lightly, and will often call for more skill and patience than the average man cares to bestow upon the matter. These exercises are, however, of very great use to the house-planner, as from the very defects one learns what to avoid in planning new work.

There are numerous small points that go towards the proper equipment of even an ordinary-sized town house. Amongst them may be mentioned:—Plenty of cupboard accommodation and good linen stores—but see that these are in suitable positions. A carefully arranged dinner and service lift from the basement to the top floor, if possible, and large enough for coats and ordinary luggage, should be arranged. The well of the back staircase is a good position, but this sometimes is further from the dining-room than is desirable. Telephones or speaking-tubes from each floor to the basement save much labour. Hot and cold water service upon each bedroom floor, and at least two bath-rooms, are required in a well-arranged house of the class we are considering. The careful arrangement of the electric lighting to control and to avoid waste must be studied, and the architect is the proper person to arrange these matters, which should be thought of when the plans are being made to avoid trouble and annoyance afterwards. The Public Health by-laws must not be forgotten, and the proper arrangement and disposition of the bath-rooms, water-closets, housemaid's sinks, &c., if not well considered in planning, lead to trouble and waste of money to an alarming extent.

No doubt all these considerations have added greatly to the difficulties of modern house planning, but by dint of much patience and persistent labour the various offices can be properly and correctly placed and—although we may envy our brothers of the craft who in earlier times had practically solved their problems when the ground and first-floor plans were made—we of this day must face our difficulties and take our pleasure in solving them. We must not be content with a thing that "will do," nor relax our efforts until we feel we have arrived at that happy compromise, the best that can be done "under the circumstances of the case." When the plans are all carefully drawn out, then is the time to study in detail the position and size of doors, fireplaces and windows, to throw light into the dark corners, to provide a proper place for everything, and therefore leave no chance for a thing to be out of its place.

"The little more, and how much it is—the little less and what worlds away!"—BROWNING.

The architect should be his own severest critic, and should

not rest so long as he can see there is a point which can be improved.

The examination of the plans published in our excellent professional journals show often enough that this is not done, and very imperfectly and badly arranged houses are still being planned and unfortunately built. Our young architects should make use of the many advantages these illustrations offer them by way of examples, and when real practical work comes they should first carefully consider what has been done before committing themselves to working drawings, which may not be the best solution of the problem. Finally, if we are to arrive at dignified and comfortable houses, "cranky" notions and mere eccentricity—which is commonly called "originality"—must be set aside.

Most people require houses to live in. We should therefore strive to concentrate the work of the house to make it, as far as possible, bright, cheerful, and well arranged and well constructed. Give every opportunity to let such sunshine as we are blessed with enter the house wherever possible, and by so doing you will add greatly to the health and comfort of its occupants.

The paper was fully illustrated; old prints, diagrams and plans were exhibited round the room on screens.

Professor BERESFORD PITE, who proposed a vote of thanks for the paper, said the notes and remarks would be useful to those who were concerned in the uses and requirements of the large London house. Simple planning was the architect's chief aim. The hall should be of ample size, large enough to have the rooms opening around it. The complicated plan had a charm in country houses, but in London it became a nuisance. It was well to break the staircase into flights.

Mr. Max Clarke seconded the vote, supported by Messrs. T. H. Watson, H. S. Collings, H. Lovegrove, F. Hooper, J. Boyton, John Murray and Dr. Voelcker.

VENTILATION AND WARMING.*

THE object of this paper is (1) to impress upon architects and others the great importance of proper ventilation in all buildings intended for the occupation of man. It was actually stated on good authority at the Sanitary Institute about two years ago that there was scarcely a building in the country that was effectually and efficiently ventilated.

2. Allow me to remind you that there are two essentials which are necessary to insure the continuance of our existence, viz, air and food. The former (air) is by far the most important—we might live days without food, but we could exist but a few moments only without air. We might exist for years on impure food, if not actually poisonous; but a very small additional quantity of certain impurities, produced by respiration and combustion, would and often do prove fatal. It has been stated, and is a fact, that "man's own breath is his greatest enemy," proving beyond a doubt that God's greatest material gift to man is pure air.

Before proceeding to the more practical part of our subject I must ask you to kindly allow me to refresh your memories on a few points connected with air.

3. The composition of air in its natural state:—

Oxygen (the vital gas)	20.90 per cent.
Nitrogen (diluent)	77.00 "
Carbon dioxide (CO ₂)	0.04 "
Argon	1.00 "
Aqueous vapour (according to temperature)	1-12 grains per cent.
Ammonia	Trace.
Organic matter, ozone, mineral salts, inorganic matter	Variable.
In towns, sulphurous acid and sulphuretted hydrogen	Trace.

Fortunately the first three important gases are found to be very uniform in their proportions in every part of the world. It should be borne in mind, when warming, that a certain quantity of aqueous vapour is necessary for health; generally about 70 per cent. of humidity is found to be the most satisfactory. It may be remarked that a considerable quantity of suspended matter injurious to health is often found in the air in towns, but the air in the country, and at high elevations is generally pure. The air is naturally purified by the wind and rain; the latter carries down the gases to the earth—CO₂ is thus absorbed by the ground to the benefit of vegetation, and the purity of the air. Plant life is also a great purifier of the air, as it absorbs CO₂. The latter is seldom found in the air in greenhouses.

4. An adult, on an average performs about 17 respirations per minute, during which he inhales and exhales about 16 cubic feet of air per hour; in the process the air when in the lungs

loses from 4 to 5 per cent. of oxygen, which is absorbed by the blood during its aëration; the exhaled air contains about 5 per cent. CO₂—equal to 0.8 cubic feet of CO₂ per hour. Of course this quantity varies according to the size of the individual, also whether he is in a state of rest or energy. It is also influenced by the temperature. Less than one-half is exhaled when the temperature is at about 90 degs. than when it is at the freezing-point. It has been found on an average that in a mixed assembly 0.6 cubic feet of CO₂ per hour may be taken as a fair average.

5. It is now admitted by all authorities on ventilation that as a rule, and for convenience, the amount of CO₂ in the air may also be taken to represent the other impurities with which it is usually contaminated, as the other impurities have been found, when the heat is not great, to vary in the same proportions as the CO₂.

6. Taking CO₂ then as the standard of all impurities, we find there are only four parts of this gas in every 10,000 cubic feet of pure air, and that it cannot be increased beyond 50 per cent. (or .0006) without being unfit for breathing.

When .0006 it can be perceived by the sense of smell.

„ .0008 (or 100 per cent. above pure air) it is offensive.

„ .0010 (or 150 per cent. above pure air) it is most offensive.

Any further increase cannot be distinguished by the sense of smell, as it becomes dulled by the breathing of foul air. We, therefore, have a limit of permissible impurity of .0002. It is the object of ventilation to keep the impurities within this limit.

7. We have now to see what quantity of fresh air has to be supplied per hour when 0.6 cubic feet of CO₂ is taken as given off by each individual, so that the standard of purity may be maintained. It will be seen that to dilute 0.6 cubic feet of CO₂ to bring it to the standard of the limit of permissible impurity, viz. .0002 (or $\frac{1}{5000}$), it must be mixed with 5,000 times its bulk of air:—

$$= 0.6 \text{ by } 5,000 = 3,000 \text{ cubic feet.}$$

So that 3,000 cubic feet of air is generally admitted as the quantity necessary per individual per hour. This quantity does not represent the amount of cubic space required per individual, as the cubic space is reduced in practice by the changing of the air—if changed three times in the hour the cubic space is reduced to 1,000 feet; if changed six times it is reduced to 500, and so on. In estimating the quantity of air required we must not omit, if gas is used, to allow 1,800 cubic feet of air for every cubic foot of gas consumed, so that the products of combustion may be properly diluted; consequently, a 5-foot gas burner is equivalent to three adults, and requires 9,000 cubic feet of air per hour to dilute the products of its combustion. We seldom realise how important it is that we should always have a proper supply of pure air, so as to insure the aëration or purification of the blood, upon which depends the maintenance of good health.

8. Successful ventilation may be stated as that which provides air in sufficient quantity, of good quality, possessing a suitable temperature and humidity. Well distributed without draughts. Complete and prompt removal of the vitiated air. The whole process being practical and economical.

Ventilation may be classed generally under the two following heads:—"Natural" and "Artificial."

9. Natural ventilation may be described as that which requires no special apparatus involving expense in working it, but is dependent on the movements produced in the air in consequence of its varying densities, which are produced by the varying temperatures and humidity. In a climate like ours we nearly always have a lower temperature outside a building than inside, which insures the chief element required for natural ventilation. This difference of temperature may not exist during the summer months; ventilation may then be obtained by opening windows, which should be specially constructed with a deep bottom bead fixed to the frame for the purpose. The movement or circulation of the air depends upon a property it possesses of expanding when heated, which it does at the rate of .00203 of its volume for each degree of Fahrenheit, assisted by the moisture it contains. When expanded it becomes lighter, and is then by the law of gravitation forced upwards by the cooler and denser air surrounding it. Wind is produced by this cause as well as natural ventilation.

10. Artificial ventilation may be described as that which requires constant supervision and expenditure to insure its proper working. It is divided into two systems—"vacuum" and "plenum," or extraction and propulsion. Each has its advocates, but of both it may be said that they are costly in working, besides requiring great care in their management.

In the vacuum or extraction system, strong currents are produced in the outlet or up-cast shafts by means of hot-water or steam coils, or by exhaust fans. There is an objection to this system when the current in the up-cast shafts is sufficiently strong, as it then causes every aperture to become an inlet, drawing impure air from sources not intended. There is also another serious difficulty in buildings having only one up-cast

* A paper read before the Society of Architects on March 19 by Mr. B. R. Tucker, member of the Council; (professional) member, Sanitary Institute, and late Chief Surveyor, War Office.

shaft, the rooms most remote from it scarcely get any current at all. For these reasons this system is in little favour.

The plenum or propulsion system has many advocates, as, unlike any other, the air can be taken from any desired source, away from contaminations; it can be filtered, washed, warmed or cooled, as desired. It is then driven by fans through tubes or ducts (generally placed in the basement), from these it is conveyed by up-cast shafts to the several rooms, &c., the air in each case discharging by a hopper-mouthed louvred opening, the louvres fixed at an angle of 40 degrees, so that the air may impinge against the ceiling. The opening is placed not less than 7 feet 6 inches above the floor, so that the air may discharge over the heads of the occupants; it then strikes the opposite wall, where it descends (split up), returns across the room to the foot of the wall at which it entered; it is here forced into outlet shafts, the openings of which are at the floor level. In the case of very large rooms the inlets may be on both sides of the rooms, and the foul air drawn through apertures formed at intervals in the floor. In any case, the position of the outlet must be such as will insure an absence of inconvenience and draught.

In no case should cold fresh air be drawn through the floor, or draughts will be produced about the feet of the occupants. The outlet shafts should be carried up through the roof and terminate each with a louvred top at some height above the ridge of the roof.

The advantages of this system are:—(a) The purest air is available can be used; (b) it can be cleansed, warmed or cooled as desired; (c) it can be changed, even eight or ten times in an hour, without causing draughts; (d) can be equally distributed to every part of the room; (e) all vitiated air can be driven out; (f) efficiency is secured independent of the force of the wind.

The disadvantages are:—(a) The long lengths of tubes or ducts so necessary to this system, which are so liable to become clogged with dust, and consequently be a means of polluting the air as it passes through them; (b) the great cost of the installation and the constant cost of working it; (c) great care and intelligence required in working it.

All inhabited rooms should be ventilated by means of fresh-air inlet ventilators and outlet foul-air flues. The natural system of ventilation is best suited for general use, as it is inexpensive and simple to work.

Domestic Rooms

11. Each room should be supplied with fresh air by means of a suitable ventilator, having an adjustable valve controlled by a cord. It should be fixed in a drop-channel opening in the outer wall near the ceiling, and furthest from the fireplace. The opening should be protected on the outside by a galvanised grating. The foul air should escape by means of a flue, of suitable size, formed in the chimney-stack between the smoke flues, with an opening into it near the ceiling, protected by a grating, ornamental or plain. The heat of the smoke flues would insure a more rapid escape of the foul air. The products of combustion from gas should be conducted into the foul air flue by means of a ventilator in the ceiling. In certain cases, as in living-rooms, a portion of the incoming fresh air might be warmed by means of a ventilating grate of approved construction. All inhabited rooms should have fireplaces for ventilation.

Large Rooms, Halls, Churches, Schools, &c.

12. In this class of building the fresh air is usually supplied by means of Tobin's tubes. These should be of a suitable size and sufficiently numerous to insure that the air is sufficiently split up so as not to produce a draught. When practicable, the fresh air passing through them should be warmed by means of hot-water or steam coils placed in suitable chambers in communication with them. The air should enter the Tobin's tubes as much above the ground as practicable to avoid ground impurities. In the case of windows, especially if large, it is advisable to place "direct" or direct-indirect radiators under them; if desired the radiators may be placed in cases or chambers; this is a good arrangement, as it effectually prevents cold draughts being produced by the cooling effect of the glass of the windows. The Tobin's tubes and cases of radiators may be so designed that they form a portion of the architectural features of the building. All windows should at least have a portion of their surfaces made to open; it should be of the hopper form of opening, well above the heads of the occupants, so that a good supply of fresh air can be introduced in warm weather. A portion of the incoming fresh air might be warmed by a ventilating grate of approved construction. The foul air should be removed by exhaust shafts terminating above the ridge of the roof, each surmounted by an extracting cowl or ventilator, having considerable extracting power when acted on by the wind—when there is no wind the current in the extracting exhaust shafts should be maintained by the employment of gas-jets or a hot-water or steam coil placed in their lower end, or by a cast-iron stove pipe fixed in the centre of the shafts and terminating above the cowl.

Hospital Wards.

13. It is possible that, as a rule, natural ventilation is best suited for hospital wards, especially when they are of ample cubic capacity, particularly as the open-air treatment by widely opened windows is now being practised in even certain London hospitals with beneficial results. The extracting power of the exhaust shafts should be aided, when necessary, by artificial heat, so as to insure the prompt removal of vitiated air. No doubt air maintained at 60 degs. Fahr., as in the plenum system, is somewhat enervating and depressing for hospitals, whereas the results of the open-air treatment would appear to show that a good supply of fresh cool air invigorates the system and increases the power of its resistance to germs, inasmuch as cool air is condensed air, and consequently imparts a larger quantity of oxygen into the system; it is also less liable to contain the germs of disease.

Large Schoolrooms.

14. It is maintained on good authority that the plenum system is the best for large schoolrooms, as it insures an equal distribution of warm pure air to each scholar. It has been ascertained that more mental vigour and increased working power are obtained with this system of ventilation than with natural ventilation. It is stated that Dr. Kerr's observations made on the air in natural and mechanically ventilated schools at Bradford, when over 250 tests were made for CO₂ during 2½ hours of afternoon school work, showed that in the naturally ventilated schools the CO₂ gradually increased from about 0.8 up to about 2.8 volumes per 1,000 cubic feet, whereas in those mechanically ventilated the amount of CO₂ remained steadily at 0.8 per 1,000 cubic feet all the time. The plenum system would be too expensive for small schools, consequently natural ventilation must be employed in these.

Barrack-rooms.

15. Perhaps there is no instance where ventilation is put to so severe a test as in barrack-rooms, where a number of men live, eat and sleep continuously in the same room. The cubic space allowed is 600 cubic feet per man, and the inlets and outlets for air are equal to 10 square inches per man. Half the quantity of the incoming air is warmed by the ventilating grate. The result of this system of ventilation is found to be satisfactory, although the area of 10 square inches would appear too small. No doubt a quantity of fresh air is admitted in this, as in other cases, by the doors and windows, and carried off by the chimney flues; in this way it is possible each man may obtain 3,000 cubic feet of air per hour, the air being changed probably about five times during that period.

Size of Ventilator and Flues.

16. This is important; it is, however, impossible to lay down a hard and fast rule. Generally it is considered that 24 square inches of area per individual, independent of the chimney, will be found sufficient. Less than this would be sufficient if the outlet shafts exceed 25 feet in height. A velocity of 5 feet of air per second through an area of 24 square inches will produce 3,000 cubic feet per hour, the quantity required. It should be stated that the foregoing quantity makes no allowance for a large supply of air which enters by the doors and windows, also through the walls, which are somewhat porous, and escapes up the chimney flue. Probably from 30 to 50 per cent. might be deducted as approximately representing this quantity, especially as an ordinary fire requires 3 to 4 feet of draught per second and a strong fire about 6 feet. A velocity of 5 feet per second at the ventilators will not produce more than about 3 feet in the room, which is the maximum that can be endured when the temperature is about 50 deg. Fahr. The lower the temperature the less should be the velocity. One foot per second is sufficient when the temperature is about 35 deg. Fahr. The position of the ventilators should be very carefully studied so as to prevent draughts. A draught may be defined as a current of air which produces a sense of chill. A prolonged cold-air bath may be very disastrous in its effects; in fact, a draught is dangerous.

(To be concluded.)

THE NATIONAL GALLERY, DUBLIN.

THE additions recently made to the above building from the designs and under the superintendence of Mr. Thos. Manly Deane, the surviving partner of the well-known firm of Sir Thos. N. Deane & Son, of Dublin, have not only practically doubled the original area of the building, but by the arrangement of dividing the additional space into separate rooms of about 30 feet square a much greater wall space is gained.

The additions consist of a basement floor for storage and workshops, and two other floors; the front portion of the building facing Merrion Square contains the entrance hall, and is otherwise devoted to the Milltown library—a large room which will serve as the board-room—the directors' room, secretaries' room and other administrative offices. The rear

portion of the new buildings which are built parallel with the old Gallery, with a courtyard between, contains the additional gallery space, and consists of seven rooms *en suite* on the ground-floor level and seven rooms on the first floor, six of the rooms on the ground floor being octagonal on plan. This form, owing to the rooms being side-lighted, was suggested by the director, Sir Walter Armstrong, and the effect is most pleasing and successful. All the rooms on the upper floor are top-lighted. The new galleries communicate with the old at both ends on each floor.

Externally the new work has only one elevation of importance, viz. on the east towards Merrion Square, the others being perfectly plain walls built of Black Calp limestone. But on the east the building is faced with granite ashlar and Portland stone dressings. The architect had a difficult problem in dealing with this front, for he was bound to follow the horizontal lines of the old Gallery, and was limited vertically between the existing entrance and the wall of an adjoining garden, which limitation prevented the portico through which the building is entered from being placed centrally.

The portico which forms the lower storey has four columns with square blocks or rustications on the shafts, with architrave and cornice over, and the upper floor has an arcade of three arches on festooned columns. This arcade was originally designed as an open loggia, but such was considered undesirable, and the arches are now filled, having on the first floor square-headed windows and on the second floor three circular windows concentric with the arches over the columns. The main cornice of the building is a continuation of that on the old Gallery.

The contractors for the work have been Messrs. Michael Meade & Son, of Great Brunswick Street, Dublin, and they have carried it out with great care and attention, and to the satisfaction of the architect and their employers, the Board of Public Works for Ireland.

The entire cost of the work, exclusive of clerk of works' salary and architect's fees, has been 18,906*l.* 10*s.*, a sum well within the contemplated cost.

The heating of the buildings, which includes the rearrangement of the old system, has been carried out by Messrs. Boyd & Son, of Paisley, at the moderate cost of 816*l.*, which sum is included in above total. The teak-block flooring of the ground floor, &c. has been done by Messrs. Geary & Walker. The carved walnut trimmings of the door opes between the Gallery rooms has been executed by Signor Carlo Cambi, of Siena, in his usual beautiful style and workmanship.

Sir Walter Armstrong has expressed the opinion that this is now "the best picture gallery in the United Kingdom," and Mr. Deane is to be much congratulated on his success.

The addition of this noble set of chambers, says the *Irish Times*, has enabled the director of the Gallery and his assistants to rearrange and set off with much better advantage than hitherto the splendid collection of paintings and of statuary which constitute the Gallery; and we cannot do better in describing the immense improvements which have been effected than to give some idea of the mode which the director has adopted to make the possessions under his care more readily available. First of all, it should be noted that one of the most important results of the addition of the twelve new rooms and the beautiful connecting passages is that all the pictures and every art object in the keeping of the authorities have been rehung, replaced and made available, and that every picture has been brought down and placed in a position in which its characters, its beauties, or, as it may be, its defects, are brought into what, for want of a better phrase, may be styled the natural plane of vision. This, it is quite needless to point out, is a very important feature of the new Gallery. None of the pictures are now skied—they are all "on the line," and their inspection and examination is no longer attended by those difficulties which were entailed in the old days.

The rearrangement of the collection has been done most effectively. The old Gallery—that is the chief room upstairs—is now given up completely to the Italian school, the Venetian pictures occupying one side, and the other "Italians" the opposite. The other old rooms are allotted to the English, French and Spanish specimens, one of the rooms, that on the left of the staircase, being monopolised by Turner. On the left-hand wall are hung the well-known pictures of the master which have long been amongst the most valued and interesting treasures of the Gallery; the opposite wall being reserved for the Turner series from the "Liber Studiorum," presented by Stopford Brooke. The water-colours have now all been grouped, the old room under the staircases having been entirely remodelled. The old offices have been added to the apartment, and the officials are accommodated in the new block. Amongst the most interesting features of the room are the Burton pictures and studies of drapery, including that marvellous bit of water-colouring, "Hee-leil and Hildebrand—the Meeting on the Turret Stairs." There are about a hundred English and Irish water-colours added

to the collection, which is now beyond all doubt a most representative and fascinating one. This room is enhanced by Watteau's drawings, and a priceless little pen sketch by Dürer. The six chambers on the upper floor of new building, together with the connecting galleries, allotted to the Flemish, German and Dutch schools. The pictures are rearranged in them, and amongst the new ones may be mentioned a most delightful study in still life by Christian Luckx, ten pictures bequeathed by Sir Henry Baillie by Dutch and Flemish masters, and amongst them should be missed a most remarkable artistic production. It is a representation of Christ in the House of Martha and Mary, the figures in which are by Rubens, the landscape and accessories by Brueghel and Kessel, and the architecture by D. van Delen. The Rubens part of the work, it is unnecessary to say, is the choicest; the figures are deliciously proportioned, and are instinct with life, grace and beauty, but it cannot be said that the rest of the picture is in any way admirable. There is a figure within the house originally painted as a woman, which for some reason another was altered and turned into a man, and altogether the work is perhaps one of the most extraordinary artistic productions in existence. In Room 18—one of the new set—the splendid example of Hondelcoeter, a study of poultry, is not likely to be overlooked. At the end of the suite there are the three rooms in which the Milltown collection will be housed. Amongst the advantages which will be derived from the erection of the new Gallery will be that an art library will be able to be brought into existence, of which there is already in the possession of the director a very promising nucleus. The intention is to have in this library principally valuable and important works of reference in relation to the fine arts, and above all the authentic catalogues of notable collections of paintings and sculpture. This library will be available to students and should prove a most useful addition to the Gallery.

The ground floor of the new building, which is, like the upper, divided into six apartments, practically forms the National Portrait Gallery. Each of the rooms is built on an octagonal shape, and—if we may be permitted to make an illustration—are 37 feet square. The length of the suite is 180 feet. This portrait gallery is now perhaps the most interesting section of the entire Gallery; at all events, it has for the people a very special and fascinating interest. In it are hung the portraits of illustrious Irishmen and Irish women and celebrated personages connected with the history and fortunes of the country. There are some "extraordinary stretches," of which is the hanging of the portrait of Garrick, but after all did not that great actor achieve a few of his finest triumphs in the historic theatre in Crow Street, and why not therefore give him a frame in the collection in which the Viceroy's portraits are acknowledged to have the right to appear? We have nothing but praise for the way in which the collection has been grouped. The old portrait gallery, which heretofore contained all the portraits, hung high up and low down, is now dedicated to engraved portraits, mostly mezzotints and a few pictures including "The Wedding of Eva and Strongbow" and "The Meeting of the Volunteers," both so familiar to everybody. Amongst the fresh exhibits in this room are a facsimile of Dürer's drawing of Irish soldiers, which is in the Berlin Museum. It was done in 1521, and has considerable historical and antiquarian value; and a modern mezzotint of the picture of Her late Majesty at the age of four, which is in the Dulwich Gallery, London. The other portraits are grouped according to periods, from the Williamite period to the present, in each room the period is indicated by a notice board. It cannot do more than congratulate Sir Walter Armstrong upon the great care and success with which he has attended to the most important part of the collection in particular. It is possible to indicate the trouble that his assistants and himself must have taken in settling this section alone, and they have succeeded in making a most interesting pictorial history of Ireland during some of the most exciting periods of our national story. We can only afford space to indicate a few "novelties" in the collection. There are portraits of J. Blake Dillon, Sir Charles Gavan Duffy, given by the latter before his death, and to them will be added a portrait of Davis and a picture of MacManus, entitled, "Reading the *Nation*," also presented by Duffy. J. B. Yeats's "Butt" is a splendid likeness, and "Curran," by Lawrence, which was bought by Lord Iveagh for 100*l.*, and given by him to the Gallery, is one of the most characteristic pieces of portraiture it is possible to conceive. The Lord Kilwarden, who met such a tragic fate this year a century ago in High Street, the Right Hon. David La Touche, and Lucas, of *Freeman's Journal* fame, are new. The last-mentioned work is by Thomas Hickey. The Garrick, by Johann Zoffany, is a very engaging portrait. The marble bust of Swift, said to be by John Cunningham; the contemporary portrait of Queen Elizabeth, a work of first-rate importance and value; the statuette of James II., the sketch by Lely of the Queen Mary of Modena, are all novelties in the Gallery.

The room devoted to Old Dublin, which contains maps

atches of the metropolis at various periods from 1610, the
e of the earliest known map, should have a very strong
ination for the citizens. There are displayed in it not only
the most important of the old maps, but the interesting
ws by James Malton, Brocas, James Mahony and others.
ahony's view, taken from the spire of St. George's Church in
53, is a marvel of detailed drawing.

LIGHTNING RESEARCH.

THE committee formed two years ago by the Royal Institute
of British Architects and the Surveyors' Institution to
investigate the action of lightning strokes on buildings with a
view to the improvement of current methods of protection,
the beginning of the year decided to confine their attention
to the future to cases where buildings were struck and injured
in spite of the provision of lightning-rods for their protection.
It of sixty cases recorded for the committee in 1901 no fewer
than twelve were of buildings fitted with some form of lightning-
conductor. Considering the numerical ratio of protected to
non-protected buildings, and allowing for the fact that pro-
tected structures are usually in some of their parts in more
exposed positions than the non-protected, the proportion must
be considered extremely unequal.

In face of some recent disasters brought to the notice of
the committee it is not surprising that dissatisfaction is felt
with the system recommended by the Lightning Rod Confer-
ence of 1882. Last year the committee's observers sent in
reports of sixteen protected buildings struck by lightning—
some slightly, others very seriously injured, or entirely destroyed
in parts. Details of these will be given in the final report of
the committee, together with comments thereon. An interest-
ing case may be quoted. It is that of a large country house in
Essex, erected some twenty-eight years ago, and till recently
without any form of protection. In 1901 a church in the
immediate neighbourhood having been struck, the owner of
the house, for greater security, decided to have lightning-rods
put up. An elaborate system was installed and completed in
March 1902, nearly every portion of the building having its
own final and conductor. During the storm season of last
year the house was twice struck—on June 17 and on August 8.
On each occasion, besides other injuries, a chimney-stack was
damaged, the brickwork being split up and the capping-stones
slodged and hurled about in all directions. The lightning-
rods on the damaged chimneys were torn from their supports
and much bent.

Other protected buildings recently struck of which reports
have been received include All Saints Church, Boyne Hill,
Aidenhead; St. Andrew's Church, Mark's Tey, Essex; New
St. Pancras Church, Marylebone Road; Swanscombe Church,
Kent; St. Botolph's Church, Aldgate; St. Michael's Church,
Highgate; Devaar Island Lighthouse, Argyllshire; South
Ireland Lighthouses; factory chimney, Nelson, Lancs;
Aveland Laboratory, Cambridge; Tiffin's School, Kingston-
on-Thames; Ainsworth Mill, Lancaster.

All these cases are being carefully studied by the committee.
They hope to be in a position to report on the whole question
of lightning protection at the end of the present year, and to
offer some suggestions for more efficiently guarding buildings.
Meanwhile they desire the continued co-operation of observers
in this important inquiry, it being necessary that they should
be supplied with as complete details as possible of "protected"
buildings to enable them to arrive at the causes of failure of
the means of protection adopted.

The committee are contributing an exhibit to the loan col-
lection of the International Fire Prevention Exhibition to be held
at Earl's Court this year, and invite the loan of objects of inter-
est appertaining to the subject for the purpose of adding to
their collection. Anyone in possession of relics of lightning
disasters, and willing to lend them, is requested to communi-
cate with the Secretary to the Committee at 9 Conduit Street.

PROPOSED LIBRARY, STRATFORD-ON-AVON.

IN a letter to the *Times*, Mr. Sidney Colvin writes:—"Of the
scores of thousands of persons who have visited with curiosity
and reverence the cottage birthplace of Shakespeare in Henley
street, Stratford-on-Avon, few surely would desire to see its
immediate surroundings transformed or modernised more than
can be helped. A plan is now on foot which, if carried out,
must inevitably have this effect. The plan is to build, by help
of funds supplied by Mr. Carnegie, a new free library in the
same street with the birthplace and about 25 yards distant
from it. Now it is plain that such a building, however dis-
creetly designed, cannot fail to be the dominant object in the
little street, and to strike a sharp note of modernity in almost
immediate contact with the birthplace itself. Surely this
vicinity should be kept sacred to Shakespeare. Local opinion
is much divided on the merits of the scheme, and it seems very
desirable that the efforts of those who are urging its recon-
sideration should be backed by an expression of public opinion

from outside. Miss Ellen Terry, Mr. Wilson Barrett and Mr.
Milliken, an American architect, who has been drawn to
make his home in Stratford by devotion to the memory of
Shakespeare—these and others have already done their best.
But a wider appeal seems to be necessary.

The exact position I understand to be as follows:—At the
beginning of last year the then mayor of Stratford, Mr. Archie
Flower, begged from Mr. Carnegie the gift of a free library for
the town. Mr. Carnegie, with his usual liberality, consented,
and subsequently he bought and gave to the trustees of the
birthplace three cottages standing in the street between it and
a piece of ground partly vacant, partly occupied by a shop
belonging to the Town Council. It is on this piece of ground,
together with the site of one of the cottages, that, according to
the plan which at present holds the field, the new free library is
to be built. The alternative proposed by those who dislike the
scheme is that Mr. Carnegie's gift should be housed, where
there is plenty of room for it, in connection with another
building which is not a part of the ancient Stratford, and
which the town already owes in great part to the public spirit
of the family of the ex-mayor, namely, the Memorial Theatre.
This seems a perfectly reasonable and graceful suggestion. As to
the three cottages which have become by Mr. Carnegie's liberality
the property of the trustees, they are very humble and quite
harmless, as any reader not familiar with the site may convince
himself by referring to the *Illustrated London News* for
December 6, 1902, where they are figured. Although one of
them has been proved to date from Shakespeare's own day (see
a letter from Miss Marie Corelli in the *Academy*), there
could be no great objection to their demolition for the
sake of the better protection of the birthplace itself from fire.
But in the minds of many there is the gravest possible concern
at the prospect of the little street being further altered by the
erection of a conspicuous modern building, associated with the
names of modern benefactors and municipal authorities.
Might not the approaching gathering for the annual per-
formances at the Shakespeare Theatre be made the occasion
for a public expression of such concern by those who share it?

The Stained Glass of the Future.

SIR,—I must apologise to Mr. Walter J. Pearce for the
apparent discourtesy in not replying to his letter in your issue
of March 13 before this. The delay was due to my not seeing
it in time to reply in your last issue.

It is not my fault if my words bear the construction he
places upon them. But when firms receive large consignments
of German antique, which they *think* is the best, but *know* to
be the cheapest; and when others substitute Norman for Early
English, even when an architect specifies the latter, which *they*,
also, try to believe is the best, but *know* to be the cheapest,
it seems high time that architects *should* be warned.

When I uttered that warning I had no idea that that
practice was so widespread. I thought that comparatively
little of the best glass was used, because architects were not
aware of its existence; but I find that the evil is due to quite
another cause. A clerk in the office of the retailers of Norman
glass made the amazing admission to me not long ago that
"scores of architects specified Early English, but they did not
get it."

May one not ask therefore, would these people have refused
to supply Early English if it had been cheaper than Norman?

Any disclaimer of superiority which the modesty of Messrs.
Powell might induce them to make would not influence my
opinion. I should think that the age of chivalry was not dead;
besides, it must be remembered that the Messrs. Powell are
very amiable people.

I am quite satisfied with my outlook, which is bounded by
what my experience has taught me is the best. I certainly
wish there was a greater demand for the two makes I have
mentioned, so that they would have to make more, because one
of their great charms is that they never repeat themselves.

Norman was held up to my admiration the other day in
that it was possible to repeat and match what they had already
made. That is to say, it has become a mechanical process.

I do not admit that my resources are limited. With these
two makes, and the boundless resources of plating these and
others, my colour scheme is practically limitless, consistent
with a certain level of quality. It is absolutely unique and
inimitable. It should be remembered that quality is of greater
importance than variety of colour.

Let who will dabble in all sorts of makes, the best is good
enough for me.

Mr. Pearce is scarcely to be envied, I think, for his
Gargantuan appetite for all makes of glass—good, bad and

indifferent. He reminds me of the Northumberland pitman who uttered the historic phrase, "There's ne bad beor! Some beor's better than others, but there's ne bad beor!" I would say any one is anathema who would use an inferior piece while a better could be obtained for "love or money," but especially for money.

I am simply amazed that any one who has the slightest feeling for quality in the material can make such a reckless statement as that the "imitations" (as Mr. Pearce calls them) of Early English have ever approached the original.

It is absurd to suppose that because the procedure may be similar the result must be the same.

How can one argue with such people? What respect should we pay to the opinion of one who having bought "Dolly Gray" at the street barrow of a music pirate for the magnificent sum of twopence should assert that it was as good as, if not better than, "Im Treibehaus," "Schmerzen," "Ich grolle nicht," and "Die Doppelgänger"? The qualities of these latter works can only be appreciated by those who habitually move in their atmosphere.

Mr. Pearce makes the alarming statement that he will defy any but an expert to tell him the difference between one make of bottle glass and another. If that be so, what a splendid opportunity to temper the material to the shorn customer by substituting the cheapest. We must take care not to pamper that poor weakling with too rich material.

Yet what a curious, but very common, sort of honesty is that which adapts itself to the customer's ignorance.

What should we say of a jeweller who gave his customers paste instead of diamonds, simply because they were not expert enough to tell the difference? After the evidence I have quoted it is by no means absurd to say that some people will substitute a cheaper quality.

Mr. Pearce does not seem to be very familiar with what goes on in "the trade," of which he certainly has too high an opinion. He would probably be shocked to learn of anyone substituting compo. at 17s. 6d. per cwt. for lead at 28s. and 30s. But why cannot he let "the trade" defend its own "honour"? He must remember the old copy-book heading.

With regard to the question of firing, Mr. Pearce must know that that is purely a relative term; that no glass can be fired without a certain loss of brilliance, sometimes it is no more than the bloom off the grape. I know perfectly well that the best Venetian opalescent and gold ruby will not fire. It is nothing to me, therefore, if somebody else's will. I should probably think it not worth the trouble.

As for the dreadful things (in choice language) that are going to happen to my painted sheet glass, let me say that they are quite imaginary. I have never had the slightest reason to doubt its permanence.

Indeed, one might almost be inclined to think that when the painted piece is glazed behind the coloured glass, it would be protected from the action of the atmosphere. And as for flashed glasses, Early English probably contains more (and ruby and blue on more bases) than any other.

I knew it would come—the famous joke about somebody's oil-colours. It must have been bubbling over in the minds of "the trade," but to Mr. Walter J. Pearce belongs the honour and glory of bringing it to light. He is so pleased with his pretty bubble that it would be a shame to prick it. So let that pass.

I must repeat once again that my ideas and methods are the result of working in the best material, and with regard to the subject of timbre, when I say that I have never seen it mentioned in any writing on stained glass, or ever seen the slightest traces of it in any work, ancient or modern, it did not seem unreasonable to claim it as my own.

To conclude, if we wish stained glass to develop we must encourage the making of the best material.—I am, &c.,

SILVESTER SPARROW.

March 24, 1903.

GENERAL.

The Statue of Robert Burns, by Mr. G. A. Lawson, H.R.S.A., has been cast, and was this week shipped to Melbourne.

The Special Commissioners appointed by the British Iron Trade Association to investigate the subject of American industrial conditions and competition, as affecting the iron and steel industries, have issued their report, and a conference has been called, for the purpose of discussing the question in the light of the facts now presented, to be held at the Westminster Palace Hotel on the 31st inst., when several papers will be read and considered.

The Ancient Church at Ickford, Bucks, is proposed to be restored as a memorial to Archbishop Sheldon. The archbishop, who was formerly rector of the parish, initiated the scheme for the re-erection of St. Paul's Cathedral after the Great Fire of London, and contributed 4,000*l.* to the work.

A Circuit Court has given judgment for 14,750 dollars in favour of Mr. E. Myers, of Detroit. He prepared plans for a new courthouse in Wilkesbarre seven years ago, which was accepted, but the Commissioners were unable to erect a building owing to the opposition of the taxpayers. The sum given includes the cost of the plans, which was 10,000 dollars with interest and costs.

Signor Nasi, the Italian Minister of Public Works, stated that the report about the dangerous condition of the ruins on the Palatine, Rome, is greatly exaggerated.

The International Historical Congress will be opened in Rome on April 2, and meetings will continue to be held until April 9.

MM. Roger Bouvard and Humbdenstock have been appointed architects for the French pavilion at the St. Louis Exhibition.

The Students selected to compete for the Prix de Rome in Architecture are MM. Coutan, Jausse, Bans, Boileau, Wielhorski, Lefèvre, Ebrard, Joulie, Fougere and Nicot.

The Excavations at Waverley Abbey continue under the direction of the Rev. T. S. Cooper and Mr. H. Hornes. The most interesting discovery of the year is a second gateway of the same date as the later portion of the lay infirmary. The dimensions are nearly 44 feet by 21 feet, and the buttresses and those of the central pillars are in excellent preservation. The building is to the west of the church and almost adjoins on to it, the entrance being on the south side, connected with a large courtyard, having an important western gateway.

Paul Flickel, the German landscape painter, died at Nervi on the 18th inst. He was born in Berlin in 1852, and his residence was in that city.

M. Luc-Olivier Merson has been asked by his fellow students in the Villa Médicis, Rome, to design the menu card for the dinner in celebration of the centenary of the removal of the French Academy at Rome to that building.

Mr. James Mansergh, C.E., was presented on Tuesday with the freedom of Lancaster. In his speech he referred to the influence upon his career derived from his association in school days with Sir Edward Frankland and Professor Tyndall, that impulsive, warm-hearted Irishman who gave to his life work. Earnest men were then beginning to think about the conditions under which poorer people live and measures of sanitary reform, including purer water supplies, were the result. Mr. Mansergh has aided 360 municipalities with his engineering skill.

A Rood Screen has been presented by Lord Aldenham to Aldenham Church.

The Chairman of the architectural and engineering section of the forthcoming Sanitary Institute Congress to be held in July at Bradford will be Mr. Maurice Fitzmaurice, the engineer of the London County Council.

Mr. Ernest Flint, F.R.I.B.A., of 80 Coleman Street, London, E.C., is the architect for the alterations about to be carried out to the Kensington workhouse.

Colonel R. W. Edis, C.B., V.D., will on Monday be presented with a silver candelabra and bowl, with an illuminated address, on his retirement from the active command of the 20th Middlesex R.V. after forty-two years' service, of which during twenty he was commanding officer.

A Cross about 25 feet high is to be erected at Mowbray, near Weymouth as a memorial of the Venerable Bede. The cost will be about 500*l.*

The Claim of Mr. J. L. Donnelly, architect, of Dublin, against the Omagh Urban Council was, on the suggestion of the Lord Chief Justice, settled by the payment of 125*l.* The claim was 149*l.* 9*s.* 5*d.*

The Freehold of Nos. 98, 100, 102 and 104 Cannon Street was sold on Tuesday by Messrs. Debenham, Tewson, Farmer & Bridgewater for 40,000*l.*, or nearly forty-four years' purchase of the present rental.

The Taylor Scholarship of 50*l.* for Irish students of law was awarded on Tuesday to Miss Elvery, of Dublin, for a statuette and a relief. A prize of 15*l.* was gained by Mr. C. French, of the Royal Academy Schools; one of 10*l.* by Mr. Beatty, of the Grosvenor Studio; another of 10*l.* by Mr. O'Donohue, and prizes of 10*l.* and 5*l.* by Mr. W. J. Leech of the Académie Julian.

The Church of St. Aldhelm's, Edmonton, which accommodates 700 worshippers, and has been erected at a cost of upwards of 7,000*l.*, was consecrated on Wednesday.

A Meeting of the Technical College Architectural Craftsman's Society was held at 204 George Street on Friday evening, 20th inst., Mr. C. Ernest Monro in the chair. A paper was read by Mr. James M'Kim on the "Glasgow Mode of Measurement." Mr. M'Kim gave a sketch of the origin and method of application of the modes generally. He then treated of different modes individually, singling out and explaining the points of general interest. A lively discussion followed.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding £5,000. Premiums of 60*l.*, 25*l.* and 15*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

CASTLEFORD, YORKS.—March 31.—Designs are invited for a free library. Premiums 15*l.* and 10*l.* respectively. Mr. H. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—April 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums of 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, Wycombe.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60*l.* and 30*l.* are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—March 31.—Designs in competition are invited for extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000*l.* Premiums of 75*l.*, 50*l.* and 25*l.* respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

SCOTLAND.—Sketch plans are invited, with estimate of cost for erection of a branch library for the Dennistoun district, Glasgow. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

SUNDERLAND.—April 30.—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100*l.*, 50*l.* and 25*l.* will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

YEovil.—April 10.—Premiums of twenty and ten guineas respectively are offered for the two best schemes for laying-out a piece of land on which it is proposed to erect a town hall, municipal buildings, markets, &c. Particulars may be obtained from the Borough Surveyor, at the Town Hall.

CONTRACTS OPEN.

ALDERSHOT.—April 9.—For supply and erection of the necessary plant, &c., for the proposed extension of the Council's electricity works. Plans and specifications of the engineer and surveyor to the Council, 126 Victoria Road, Aldershot.

ALDERSHOT.—April 14.—For erection of proposed public offices and fire-station at Aldershot. Mr. C. E. Hutchinson, architect, 11 John Street, Bedford Row, London.

ALNWICK.—March 31.—For erection of a 150-quarter malt-house, adjoining the Tweed Dock and North-Eastern Railway sidings at Tweedmouth, Berwick-on-Tweed Messrs. Brewill & Bailey, architects, 44 Parliament Street, Nottingham.

ALNWICK.—April 3.—For construction of two blocks of houses for the working class in Clayport Gardens. Mr. G. Wilson, town surveyor.

BARKING.—April 3.—For construction of a temporary bridge and road, concrete, stone and brick abutments, &c., for a new bridge over the river Roding, the formation and paving of roads and footpaths in connection therewith, in the urban district of Barking. Mr. J. Percy Sheldon, chief surveyor, County Offices, Chelmsford.

BARNSELY.—April 2.—For erection of new stabling, carriage-house, &c., and alterations and additions to the Star inn, Cudworth. Messrs. R. & W. Dixon, architects, 5 Eastgate, Barnsley.

BARNSELY.—April 2.—For erection of stabling, clubroom, &c., at the Three Horse Shoes Inn, Brierley. Messrs. R. & W. Dixon, architects, 5 Eastgate, Barnsley.

BATLEY.—March 30.—For erection of three residences, Bradford Road, Batley. Mr. John H. Brearley, architect, Branch Road, Batley.

BENTHAM.—April 8.—For erection of the Bentham Wesleyan chapel and schools. Mr. John F. Curwen, architect, 26 Highgate, Kendal.

BOLLINGTON.—April 11.—For construction of a circular covered service reservoir, to contain 100,000 gallons, and for connecting up the same to the present water-main, with all necessary fittings and appurtenances. Mr. W. H. Radford, engineer, Albion Chambers, King Street, Nottingham.

BOSSINGTON.—March 31.—For erection of a pair of cottages at Bossington. Mr. Thomas Stopher, architect, 57 High Street, Winchester.

BRADFORD.—March 31.—For reconstruction of conveniences at the abattoir, St. James's Market. Mr. Frederick Stevens, town clerk, Town Hall, Bradford.

NEW CATALOGUES.

THE new revised catalogue for 1903 just being sent out by Messrs. Jas. Bedford & Co., engineers, Halifax, contains numerous illustrated descriptions of their various makes of ventilators, syphon, exhaust, &c. The designs for these are eminently graceful and pleasing, and offer a wide field of choice, their lines being carefully adapted to the various styles in architecture. The syphon ventilator may be regarded as the specialty of the firm, who have given great attention to perfecting it; it is made entirely of zinc, so is both light and durable, and its price is relatively low.

MESSRS CROGGON & Co., of Upper Thames Street, E.C., and Fairfield Road, Bow, are issuing a new catalogue, of which Section 1 is devoted exclusively to illustrated descriptions of iron and steel roofs and buildings, and Section 2 to wood-framed and galvanised iron structures. Among the illustrations are sketches of a variety of buildings which have actually been erected by Messrs. Croggon, embracing hospitals, factories, drill-halls, churches, club-houses, bungalows, billiard-rooms, verandahs, farm buildings, stables, boat-houses, granaries, cycle and other sheds, &c. In the more important cases plans, dimensions and specifications are given, as are also some useful measured sections of roofs, &c.

TRADE NOTES.

THE Yost Typewriter Co., Ltd., have just obtained a Royal Warrant from H.R.H. the Prince of Wales for the excellence of their machines.

THE clock erected in the Mallock Memorial Clock Tower, Torquay, was made by Messrs John Smith & Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements, and guaranteed by the makers to go to great accuracy. Mr J. Donkin, F.R.I.B.A., architect, Bournemouth, designed the tower.

THE Chancery Lane Safe Deposit Company have issued a descriptive pamphlet illustrating their system and the recent new extensions of the Safe Deposit. The Company have of late greatly extended the facilities in connection with their Safe Deposit.

MESSRS. T. & R. BOOTE, LTD., encaustic and glazed tile manufacturers, of Burslem and Birkbeck Bank Chambers,

H. & S. have made and fixed many at Unions, Hospitals, Factories, Warehouses, Race Stands, and Private Houses.

QUOTATIONS FOR CASTINGS.

Southampton Buildings, W.C., have opened a store at the Midland Railway Company's Goods Depot, King's Road, St. Pancras, N.W., which they trust will be a source of great convenience to their customers. Their London offices are connected with the store by a private telephone, and goods can be despatched the same day as ordered.

IN our notice of the exhibition held in Manchester last year in connection with the Sanitary Congress, we directed our readers' attention to Mr. William E. Farrer's (of Birmingham) exhibit of "Torfit," a new sanitary building material for urinals, &c. Mr. Farrer has recently fixed a sample stall of "Torfit" in the underground convenience in Oxford Circus, London, where it is on trial and where, of course, it is open to inspection.

VARIETIES.

A NEW Primitive Methodist school has been opened in Acre Lane, Oldham. The estimated cost of the building is 1,334*l*.

THE new school built by the Old Monkland School Board in Dundyan Road, Coatbridge, was formally opened on the 20th inst. The building is situated to the west of Whifflet Farm, and accommodation has been provided for 670 pupils, and the total cost of the finished building and accessories is close on 7,000*l*.

A NEW chapel and Sunday school in connection with the Methodist New Connexion church have for a long time been needed in Higher Openshaw in consequence of the rapidly-increasing population. On Saturday a new Sunday school—a part of the scheme—was opened. The cost of the church and chapel will be 2,542*l*, and that of the school itself 1,207*l*.

THE Pittencreeff (N.B.) new school was formally opened on the 23rd inst. It was designed by Mr. David Barclay, Glasgow, and has cost about 8,000*l*, is two storeys in height and measures 90 feet 6 inches by 82 feet 6 inches. On the ground floor there is a drill hall, 52 feet by 31 feet 6 inches, from which entrance is had to five classrooms for sixty scholars each. Two staircases give access to the upper floor, where there are five classrooms for sixty scholars each and one room for forty, making the new total accommodation 640. Teachers' rooms, cloak-rooms and lavatories are provided. Certain

alterations and improvements will be proceeded with upon the older building, which will become more especially an infant and junior school, with sewing-room. The old centre school-room will be made a kindergarten drill hall for the infants.

THE new church which St. Patrick's Roman Catholic congregation have had built on a convenient site on Strathleven Place, Dumbarton, from designs by Messrs. Dunn & Hansom, Newcastle-on-Tyne, was opened on Sunday last. The church is a massive and handsome structure in red sandstone, and has cost something like 9,000*l*. At the opening ceremony high mass was celebrated, the service being specially conducted by Archbishop Maguire, of Glasgow. Although admission was by high-priced ticket there was a large congregation. At the evening service the sermon was preached by the Rev. Jas. H. Kirk, of Tollcross. There was a large attendance of West of Scotland Catholics, and special trains were run from Glasgow and other places on the North British Railway.

THE Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its usual monthly meeting on Thursday, the 19th inst., at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. There were also present the Revs. Canon J. Allen, D.D., Dean Blakiston, Canon J. Erskine Clarke, S. A. Donaldson and A. G. Ingram, Messrs. H. W. Mozley, J. E. Ollivant, F. H. Rivington and the Rev. W. B. L. Hopkins, secretary. Grants of money were made in aid of the following objects, viz.:—Building new churches at Barry Dock (St. Mary), Glamorgan, 200*l*. for first portion; Ben Rhydding, near Ilkley, Yorks, 200*l*.; Hopwood (St. John the Evangelist), near Birch, Lancs, 75*l*.; Palmer's Green (St. John), near Southgate, Middlesex, 100*l*.; and West Ealing (St. James), Middlesex, 75*l*.; towards rebuilding the church of St. Paul, Skelmersdale, Lancs, 55*l*.; and towards enlarging or otherwise improving the accommodation in the churches at Lower Guiting (St. Michael), Gloucester, 35*l*. in lieu of a former grant of 25*l*.; and Ranworth (St. Helen), Norfolk, 40*l*. in lieu of a former grant of 30*l*. A grant was also made from the Mission Buildings Fund towards building a mission church at Aldington, near Hove, Sussex, 50*l*. The following grants were also paid for works completed:—Ilford (St. John), Essex, 150*l*.; Blyth (St. Mary), Northumberland, 40*l*.; Claverley (All Saints), Wolverhampton, 30*l*.; Buckland in Dover, 75*l*. on account of a grant of 175*l*.; and Scarborough

Saviour), Yorks, 4c7. In addition to this the sum of 1617. paid towards the repairs of twenty-two churches from funds held by the Society. The Archbishop of Canterbury, president of the Society, has announced his intention to the chair at the annual general court to be held at the arch House on Tuesday, May 19, at 2 30 P.M.

BUILDING AND BUILDERS.

the Hoole Wesleyan chapel an organ chamber is to be ed at a cost of 4507.

COL. W. L. COKE, Local Government inspector, held an inquiry recently into the application to borrow 6,5007 for the sewerage of Gedling, Notts. Messrs. Elliott & Brown, of Nottingham, are the engineers to the scheme.

A NEW slaughter-house which, by the way, is much needed, be erected at Dalkeith. Mr. Greig, architect, has made examination of the proposed site, and recommends it as entirely suitable. The Council have resolved to obtain tiled estimates for the building, and it is intended it should cost complete more than 2,0007.

THE Wesleyan chapel committee has sanctioned a further outlay on new chapels, Sunday schools and mission halls 50,0007. The work carried on in Liverpool by the late Charles Garrett is to be extended by the erection of new premises, estimated to cost 43,0007. A grant of ably 10,0007, will be made to this scheme from the Wesleyan Twentieth Century Fund. New mission premises also to be erected in Hull at an outlay of 32,0007.

A LOCAL Government inquiry has been held at Colwick by W. L. Coke into the application for a loan of 6,0007 for sewerage of Colwick, Notts. Mr J. R. Elliott, A.M.I.C.E., the firm of Elliott & Brown, civil engineers, Nottingham, gained the scheme, which consists of cast-iron and stone sewers, pumping station with duplicate gas-engines and pumps and pumping main connecting on to the Nottingham Corporation outfall sewer.

AT a meeting on the 17th inst. of the Sheffield and District Painter's Association at the Builders' Exchange, Cross Street, Sheffield, a paper was read on the "Chemistry of Colour," in connection with the Association, by Mr. T. Hey France, of Rotherham. He treated the subject in a

thoroughly practical way, and during the evening tested several pigments forwarded by various members, much to the edification and satisfaction of those present. The lecturer referred in strong terms to the spurious materials that are on the market, and advised every member of the Association to be on the alert.

AT a meeting of the Ayr Town Council the question of a new infectious diseases hospital came up for consideration under a report by Mr. John Eaglesham, architect, giving alternate schemes and estimates. The first estimate provided for an expenditure of 9,9557 and the second 7,8057. A minute recommending the adoption of the first alternative was unanimously adopted. The proposed hospital is to be erected at Heathfield in connection with the buildings there put down for a smallpox hospital, but which are now to be incorporated with the proposed new hospital.

THE North-Eastern Railway Company have begun an important scheme, the carrying out of which will place Hull in possession of a railway terminus more in keeping with its commercial importance than is the existing structure. The whole of the property required in connection with the additions to and remodelling of the Paragon Street station premises has been acquired and is being demolished. The platform and cab accommodation will be more than doubled, and the roof area will be increased to an even greater extent. The new roof will be of striking appearance, resembling the fine curved iron roof of the York station. The total accommodation is also to be increased.

PLANS have been passed and the contracts accepted for the new Robert Ferguson schools, which it is proposed to erect in Carlisle. The accommodation to be provided will be for 300 mixed scholars on the first-floor and 350 infants on the ground floor. The contract with Messrs. J. & R. Bell is for the whole of the work of erecting the schools, exclusive of the services of the clerk of works, architect, &c, and amounts to 8,9777 2s. 8d. With the other expenses added it is expected that the total cost will be about 12,0007, and the Education Department have given their sanction for the borrowing of 11,7677. The site cost 1,3067, and was purchased for that sum in 1897. In reckoning the total cost of the school that figure must be added to the 12,0007.

AT the Coventry School Board approval has been received from the Local Government Board of a site in Swans Lane for a new school. The Board also proposes to enlarge Earlsdon

Office: Imperial Buildings, Ludgate Circus, E.C.

school. When these schemes are carried out Coventry will have accommodation for all reasonable elementary educational requirements. The chairman (Alderman Bird) and vice-chairman (Alderman Booth) were reappointed representatives on the general municipal charities. The clerk presented an interesting *résumé* of the work of the Board and its cost. Since 1897 the number of children had increased from 4,853 to 7,296, and the cost from 14,619*l.* to 24,994*l.* The total average cost per child had but slightly increased, but there was a noticeable increase in teachers' salaries.

THE Swansea School Board inaugurated on the 12th inst. work on two new schools, the erection of which will involve an expenditure of nearly 29,000*l.* One of these is in the outlying district of Pentrechwyth, where an infants' school is in course of construction at a cost of nearly 3,000*l.* The other school is at the Hafod, which will be a three-department school and will cost about 26,000*l.* The proceedings consisted of laying the foundation-stones of both, the first ceremony being at Pentrechwyth. Mr. Wignall officiated, being presented with mallet and trowel, the gifts of the architect and contractor, Mr. T. H. Jones and Mr. Rosser respectively. The foundation-stone of the Hafod school (which takes the place of the old Vivian school) was laid by the chairman of the Board (Mr. D. Roberts), who was presented with trowel and mallet by the architect (Mr. C. E. T. Lawrence) and the contractors (Messrs. Weaver).

THE quarterly meeting of the South Wales Building Trades Employers' Federation was held at the Castle hotel, Merthyr. The representatives present were:—Messrs. J. E. Turner, W. Thomas, W. Symonds, C. W. Couzens, W. T. Morgan and James Allen, of Cardiff; W. M. Blackburn, W. A. Linton and A. S. Morgan, of Newport; W. O. Jenkins, B. Bennett and W. H. Billings, of Swansea; W. N. Ingledeu and D. O. Evans, of Merthyr; and D. Williams, of Pontypridd. Mr. W. M. Blackburn presided. The Merthyr representatives reported that nothing further had been done with the notices that had passed between the Masons' Society and their Association, and in case of their failing to agree certain arrangements were made. It was reported that the half-yearly meeting of the National Federation was, by invitation, to be held at Cardiff in July next, and a resolution was passed agreeing to co-operate with the Cardiff Association in this matter. It was resolved that the annual meeting of the Federation be held at Newport in June next.

THE Mediæval town church of St. Andrews, N.B., is about to undergo a course of much-needed restoration, the scheme for which, as proposed by the architect, Mr. Macgregor Chalmers, is briefly as follows:—The galleries will be removed, the side aisles will be reduced to their original height, which has been recently discovered. The pillars and arches will resume their old places and form, and on them the clerestory will be rebuilt. The so-called "bishop's" or "communion aisle will be remodelled, and the corresponding one of small size built to the north. A new aisle will be built to the east of the bishop's aisle. The porch shown in every plan and drawing up to and including that of 1767 will be rebuilt on former foundations if they can be found. The tracery of the windows and the mouldings and decorations of the doors will be in keeping with the suggestions given by these old sketches and by contemporary churches. The walls will be of stone throughout. The greater part of the seats will be of oak. It has been decided that the funds raised to commemorate the late Dr. A. K. H. Boyd should be devoted to the erection of the pulpit in the restored church. Dr. Boyd's great gifts as a preacher and interest in the restoration of the "parish church in a university city," where so many of his widely-known sermons were delivered, will thus be fitly recognised. The estimate of the probable cost of restoration is 23,375*l.*

It has been decided by the Roman Catholic congregation in Musselburgh forthwith to proceed with the erection of a handsome stone church more suited to their requirements than that possessed by them at present. Designs have been accepted, which are the work of Mr. A. E. Purdie, Carterbury, who was the architect of the Poor Clares Convent, Liberton. Of Early Gothic architecture, the new church will be cruciform, having a nave measuring 98 feet long by 34 feet broad, transepts, chancel, organ chamber, baptistery and two sacristies, which will provide direct communication with the presbytery or priest's house, which is also to be erected. In memory of the ancient shrine and chapel destroyed by the townfolk of Musselburgh in Reformation times, the building will be styled the Church of Our Lady of Loretto, and will be erected on the site of the present chapel in Wondel Street. This chapel, which for three years has been a chapel-school earning Government grants, was originally a private Episcopal chapel belonging to Lady Mary Oswald Inveresk, and acquired by the local Catholics nearly 23 years ago, between which date of acquisition and the Reformation there had been no meeting-place for Catholics in Musselburgh.

A PREVENTATIVE OF LEAD POISONING.

WE lately commented on the Government investigation of the risks arising from the use of certain moorland waters. It was demonstrated that by careful filtration the danger arising from conveying such water in lead pipes is minimised if not removed. That is assuring to the inhabitants of the towns which come within the scope of the inquiry. But it should be remembered that only one class of water was considered, and the conclusions of the scientific inquirers of the Local Government Board cannot be accepted as applicable everywhere in Great Britain. There is water which, in theory at least, could be considered as preservative of leaden pipes, while on the other hand, in many places the lead exerts a deleterious influence on the water. Efforts have been made to remove the danger by lining the pipes with another material or composition, and various patents have been brought out. The difficulty is to find a substance that will be enduring and innoxious, and at the same time is capable of so close a combination with the lead pipe as to become equal to an amalgamation with it. The latest puckering of the lining is fatal to its efficiency. The most satisfactory and successful effort to overcome the difficulty which has come under our observation is that of Messrs. Hanson, Dale & Co., Limited, of Huddersfield. The firm has long been known as manufacturers of lead piping, and of course are aware by practical experience of what is desirable. They have recently produced two varieties of improved pipes. One is a pure solid-drawn block-tin pipe, which from being homogeneous throughout cannot present even an infinitesimal danger through the chemical action of the water, and has an immunity against rust or corrosion. It merits to be employed at least for the pipes conveying water for dietetic purposes in houses, while ordinary piping would serve for supplies to baths, lavatories, ash-houses, &c. The second invention is a tin-lined lead pipe. A section shows there are two materials employed, but the combination is so close as to be inseparable. It has all the advantages of a unified material. Chemical scrutiny has demonstrated it is absolutely free from risk, while the pipe retains the advantages which plumbers maintain are only forfeited by lead. Both kinds of pipe can be recommended as being in sanitation, for the most apprehensive housekeeper can be confident that with Messrs. Hanson, Dale & Co.'s, Ltd., the purity of the water is safeguarded.

LONDON COUNTY COUNCIL ART SCHOLARSHIPS.

THE Technical Education Board of the London County Council have awarded the following art scholarships and exhibitions on the result of a recent competition for which 530 candidates entered:—Nineteen Schools of Art scholarships—five of the value of 20*l.* a year for two years and fourteen of the value of 10*l.* a year for two years; thirty Artisan Art scholarships—nine of the value of 20*l.* a year for three years and twenty-one of the value of 10*l.* a year for three years; ninety-three Junior Artisan Evening Art exhibitions, of the value of 5*l.* a year for two years. The examiners on whose recommendations the awards were made were Mr. George Frampton, R.A., Mr. R. Catterson Smith, headmaster of the metalwork school at Birmingham, and Mr. E. S. Prior, secretary of the Arts and Crafts Exhibition Society. The works selected from those submitted by the competitors were exhibited last week at the Northampton Institute, Clerkenwell. The following are the names of the candidates who have obtained the most valuable scholarships:—Five Schools of Art scholarships of 20*l.* a year—Sarah C. V. Jarvis, Battersea Polytechnic; Sarah E. Meekren, Royal College of Art; Maggie Richardson, Goldsmiths' Institute; Constance M. Skinner, Hammersmith School of Art; and Paula D. Wulff, Battersea Polytechnic, all art students. Nine Artisan Art scholarships of 20*l.* a year—George F. Brodrick, glass painter, and Arthur E. R. Gill, letter-cutter and signwriter, L.C.C. Central School of Arts and Crafts; Frederick B. Hitch, carver and modeller, Royal Academy; William A. Krüger, draughtsman, and George D. Macdaugald, modeller, L.C.C. Central School of Arts and Crafts; Hubert J. S. Martin, cabinet-maker (own account), Camberwell School of Arts and Crafts; Henry J. Pledger, plumber, L.C.C. Shoreditch Technical Institute; Edward Woore, stained-glass worker, and Algernon Young, designer, L.C.C. Central School of Arts and Crafts.

THE plans for the new Roman Catholic church of St. Albans have been approved by Cardinal Vaughan. The church will be in the Roman style, a plain but substantial building, designed to accommodate between 600 and 700 persons, and comprises a broad nave and aisles lighted by clerestory windows.

ENGLISH ROADS.

THE President of the Local Government Board has appointed a departmental committee to inquire into the general condition and sufficiency of the roads of England and Wales, and to report whether any, and if so, what amendment of the law relating to these matters or its administration is desirable, in view of the various purposes for which the roads now are or shortly may be utilised, and particularly whether any change of the authorities who have control over the roads or of their powers is required.

The members of the committee are Mr. J. Grant Lawson, M.P. (chairman), the Right Hon. Sir J. E. Dorington, Bart., M.P., the Hon. A. Stanley, M.P., the Hon J. W. E. D. Scott-Montagu, M.P., Mr. W. J. Bull, M.P., Mr. E. R. Pickmere, town clerk of Liverpool; Mr. G. C. Kent, town clerk of Longton; and Mr. S. Woodbridge, clerk to the Brentford Urban District Council.

Mr. R. G. Duff, of the Local Government Board, will act as secretary to the committee.

PREMIUM SYSTEM IN WORKSHOPS.

A GENERAL meeting of the Institution of Mechanical Engineers was held at the Institution House, Storey's Gate, on Friday evening, when a paper was read by Mr. James Rowan on "A Premium System applied to Engineering Workshops." Mr. Rowan is the head of a large marine engineering firm in Glasgow, by which the premium system has been adopted. He pointed out that the system involved expenditure of capital, and it was only by the most assiduous attention and the utmost perseverance that it can be carried through. The first thing to do was to establish a separate department for rate fixing. In a workshop with about 150 machines three men should gather all the data needed in two or three months. Standard times were thus established. On introducing the system an explanatory pamphlet should be issued to the workmen, as they were apt to regard it with suspicion. The premium system was started in his works in February 1898, and since then the average times of the machinemmen had been reduced during the four succeeding years by 20, 23, 31 and 37 per cent. The earnings of the men had increased by these percentages, and they stated they were thoroughly satisfied with the system.

The system was founded on the principle that a regular hourly rate of wages was paid irrespective of output. A standard time was laid down for the performance of any given piece of work, and if the workman completed the task in a less time than the standard he received pay in addition to the hourly wage in accordance with the time saved. At the worst the man got his hourly wages, and if he could execute the job more quickly than the standard time he earned additional money. The system had been introduced with success in America, the output of the factory being largely increased, to the employer's benefit, and the men earning greatly increased wages.

PROTECTION OF STEEL AND IRON.

ON March 6 Mr. Maximilian Toch delivered a lecture before the American Chemical Society on the "Permanent Protection of Steel and Iron," and demonstrated by means of photographs and photo-micrographs that steel and iron are corroded in some cases slowly and in others rapidly even when embedded in masonry. The microscopic structure of several cements was shown, and the speaker prophesied that in the future oil paint will in a great many instances be displaced by cement paints. From chemical investigation it was concluded that the cements as used for building purposes are unfit for coating steel, because most of them are carriers of oxygen, and instead of liberating pure lime in their setting they liberate a calcium ferrite which produces rust when in contact with a clean steel. The speaker mentioned novel experiments which he had made with cement preparations by changing the specific gravity of the cement, ridding it completely of iron, and diluting it in such a way that it can be used as a paint. It is made to set quickly so that it not only adheres to the steel and iron but it has the same coefficient of expansion. It is anticipated that Mr. Toch's method, on which he has worked for years, will cause extensive changes in the preservative coating of steel structures. He believes that unless the masonry of some of the new sky-scrapers will support the floors and ceilings it is doubtful whether some of them will stand fifty years. Moisture alone will not rust steel or iron, but carbonic acid, ammonia and sulphurous acid are violent producers of rust. Continued oxidation is bound to weaken a steel member. It was stated that steel embedded in some kinds of cement would not oxidise but that in other kinds it would oxidise rapidly.

"MAKING GOOD."

JUDGMENT was given by Mr. Justice Kennedy in the King's Bench Division on Saturday, in an action brought by Mr. Stanley Broadbent, trading as Broadbent & Co., at Leicester, against Messrs. T. & W. Meadows, Heaton Norris, Stockport, to recover 208*l.* 17*s.* 8*d.* as a balance due for work done. The action had been heard at Nottingham. The defendants had entered into a contract to erect buildings in connection with a sanatorium at Baguley, and had employed the plaintiff on a sub-contract to do a portion of the slating and tilingwork. The defence was that the plaintiff's work was not left complete to the satisfaction of the architect, which was a condition precedent to the right to claim, and alternatively that if there was any money due to the plaintiff 105*l.* was sufficient to satisfy the claim. The point in dispute was whether the plaintiff was to make good after other trades." There was a condition in the original tender that plaintiff should not make good after other trades. The tender was ultimately reduced, but his Lordship said he found nothing which deprived the plaintiff of that provision. It would be unreasonable and unfair that the subcontractor should have his slates and tiles broken or cracked because the other trades had not done their work to the satisfaction of the architect. The plaintiff was substantially right, but inasmuch as his remuneration was to depend on the measurements of the architect he could only give judgment for the 105*l.* paid into court. He directed that the defendants should pay one-half of the plaintiff's taxed costs, and refused a writ of execution.

ENGINEERING AND SCIENTIFIC ASSOCIATION OF IRELAND.

MEETING of this Association was held on the 18th inst. at Merrion Row, at which Mr. R. D. Timmins read a paper (illustrated by views) on "Well and Artesian Boring, with note on Water Divining."

The president, Mr. T. G. Purser, occupied the chair. Mr. Timmins read his paper on "Well and Artesian Boring," which proved of exceptional interest, as searching for wells on scientific principles was practised by but a few engineering firms, and the literature on the subject was rather limited. Having described the geological conditions necessary for a supply of water, the lecturer alluded to the difficulty always found in deciding on the site for a boring, and to the

disappointment often experienced through geological faults when the general conditions appeared favourable. He then spoke of the great success which attended the work of the professional dowser, or diviner, and to the investigations carried out by Professor Barrett, the results of which were brought before the Society of Physical Research. The conclusion arrived at seemed to be that the dowser could be relied on to find water if the depth did not exceed 50 feet, and the quantity required not to exceed an ordinary private supply. For a public supply from greater depths a hydro-geologist should be consulted. The question of the hardness of water was a point of importance in any supply, and he put in tabular form the temperature of water at different depths, the high temperature of 62 degs. Fahr. being found at the depth of 1,350. Mr. Timmins then described the boring of the well for the supply of the town of Gainsborough, carried out by Messrs. E. Timmins & Sons, of Runcorn. The work was commenced in 1895, and on April 1, 1897, an unfortunate accident caused the boring tool, weighing 45 cwt., and 500 feet of rope, weighing 1½ ton, to be left in the borehole. After 22 months' labour these were recovered, and the well successfully carried to a depth of 1,515, and now an amply supply of water was obtained.

A discussion followed, in which Messrs. Holliday, Parr, Arthur Spence, Best and John Miller took part, and on the motion of Mr. Holliday, seconded by Mr. Parr, a vote of thanks to Mr. Timmins was passed amid applause.

NOTTINGHAM NEW WORKHOUSE AND INFIRMARY BUILDINGS.

ON the 18th inst. the palatial pile of buildings which have been erected at Bagthorpe, Nottingham, and which are destined to use as workhouse and infirmary buildings, were formally inaugurated. Built to the plans of Mr. Arthur Marshall, A.R.I.B.A., of Nottingham, this workhouse is regarded as one of the most extensive and completely equipped of its kind in the country. It occupies a site containing 67½ acres, which was purchased from the Corporation at a cost of 12,900*l.*, and provides accommodation for close upon 1,700 inmates, exclusive of staff. The total expenditure has amounted to about 240,000*l.*, and details furnished by the architect disclose the fact that the average cost per bed has reached 127*l.* In the main building for inmates in health there is room for 624, with special

Excelsior and Rawdon Potteries,

provision for married couples; the infirmary is composed of eight pavilions with sixteen large wards for twenty-eight beds, giving a total of 480 patients, and other buildings furnish accommodation for children, consumptives, the feeble-minded and epileptic, and tramps, together with receiving wards, isolation hospital, nurses' home, workshop, mortuary, bakery, laundry, boiler and engine-houses, and a chapel to seat a congregation of 500. Briefly summarised the accommodation is as follows:—In the main building, 703; infirmary, 612; insane wards, 250; which with 55 nurses and a staff of 72 gives a total of 1,692. Mr. Marshall calculates that 100,000 tons of goods and materials have been brought to the site on the sidings, &c., and that 13,500,000 bricks have been used up, or enough, if placed end to end, to reach from London to Constantinople. There are seven acres of tile roofing, and the glass used in the work would suffice to pave half the Great Market Place. Draining is dealt with in seven miles of drains, and in the electric-lighting department there are 2,700 lamps, 40½ miles of wire, 13 miles of steel tubing and 36,000 screws. For the heating and hot-water service ten miles of piping have been laid, and the Nottingham Guardians have the distinction of having installed apparatus for domestic hot-water supply, the circulation of which is longer than any other in the British Isles. The foundation-stones of the workhouse were laid on April 17, 1899, by the then chairman of the Board (Councillor Charles Smith) and the chairman of the building committee (Alderman J. Jelley), but from first to last the work has extended over a period of six years.

of Oatlands and Overnewton, which they laid out for building purposes, and took the purchasers bound to erect houses of a certain character. The result financially has been profitable to the Corporation, the price received by the Corporation, which was converted into feu duties, being very considerably in excess of the purchase price and moneys disbursed in laying out the two estates. In his report on the census of 1901, page 23, the medical officer states that these houses "represent the best class of modern artisans' dwellings in the city." The idea present to the mind of the Corporation in arranging for the erection of these houses was, I believe, to provide accommodation for those who were being displaced by the demolition of buildings in the Saltmarket district. The houses were, however, rather larger and more expensive than suited those who were being dispossessed, and were in consequence let to ordinary tenants.

The evidence laid before the commission which recently sat to dispose of the Glasgow Corporation (Water, City Improvement and General) Provisional Order, 1902, showed that the scheme of the Corporation of Leeds for dealing with the housing problem was to acquire suitable land, and to resell it for the erection of workmen's houses at such prices as would enable this to be done at a profit to the builders, the Corporation making a loss upon the sale of the land and recouping themselves from the rates.

While such a scheme as this it seems to us is suitable for Glasgow, we think that the object in view might be attained with the assistance of the Corporation without any charge upon the rates.

What we have in view is the formation of an ordinary company for the purpose of building houses for the labouring classes with a substantial capital and corresponding borrowing powers. We have been considering the acquisition of sites for building, and are advised that it would be possible to get suitable sites within the city convenient for the population to be accommodated at comparatively reasonable figures. Having acquired the land, we propose that the company should erect houses somewhat of the type built by the Corporation under the Act of 1897 at Haghill and in Baltic Street, but subject to certain modifications.

One of the difficulties experienced by the ordinary builder in the erection of houses of this type is that the back walls of brick and other expedients used in construction for the purpose of reducing cost render such buildings unsaleable except at a depreciated price, and also prevent a loan being obtained on

HOUSING IN GLASGOW.

THE following letter from Dr. David Murray relating to the formation of an ordinary company for the erection of houses in Glasgow for the labouring classes has been sent to the Lord Provost, and will be submitted to the consideration of a committee:—

Some of us who are interested in the housing question have been considering what could be done with the view of providing suitable accommodation for the labouring classes at moderate rents, and have roughly sketched out a plan, one of the elements of which is some assistance from the Corporation, which I shall shortly explain.

Under the Act of 1866 the Corporation acquired the estates

inary terms. A tenement with a brick back, or even wholly brick, may provide dwelling-houses just as sanitary and as comfortable as a tenement of polished ashlar with the usual back wall of rubble or dressed stone. It is not, however, nearly so marketable, even after making allowance for the difference in cost. In building such houses the Corporation has the advantage that they do not require to sell, and they are able to borrow the whole of the cost at a comparatively moderate rate of interest, not upon the security of the tenements, but of the rates.

The object of the company which it is proposed to incorporate would be to hold and manage, not to sell, such property, and would therefore in this respect be in the same position as the Corporation. The company, however, could not borrow the money upon the same favourable terms as the Corporation, and what occurs to us is that the Corporation might themselves lend the usual two-thirds of the value to the company upon the security of the houses they erect on the same terms as money is advanced by the Corporation to the Improvement Trust Department.

Under such an arrangement the Corporation would run no risk. Each tenement or block of tenements would be valued in the ordinary way, two-thirds or thereby of the valuation could be advanced and a bond and a disposition in security could be granted as usual. The houses would be erected according to plans to be approved of by the Corporation, and the houses would be practically managed pretty much after the manner which the Corporation itself adopts.

The scheme of the company would be to build houses that would give a return upon the capital invested, and it is obvious that the necessary capital could not be raised except upon dividend-paying terms. It is proposed, however, to restrict the dividend payable to a maximum of 5 per cent. Any profits beyond that amount would be carried to a reserve fund, and applied in maintenance or reconstruction or otherwise for the benefit of the property. The sum at the credit of the reserve fund would not be divisible among the shareholders.

It will be a great favour if your lordship will give this proposal your favourable consideration. The assistance of the Corporation is an element in our scheme, and we cannot take any very active steps towards carrying it out until we know whether the Corporation are likely to entertain the proposal.

Mr. John Honeyman writes in the *Glasgow Herald*:—

As one of those who have for many years taken a deep interest in the housing problem I desire to offer a few remarks

on Dr. Murray's letter which was submitted to our Town-Council yesterday, and which is favourably commented on in the *Herald* to-day.

I quite agree with Dr. Murray that it would be very much better that the work of building houses on a large scale should be undertaken by a private company, such as he suggests, than by the Corporation; but, in the first place, it requires to be proved that any such scheme of building on a large scale is necessary. The evidence hitherto led before the Municipal Commission distinctly tends to prove the reverse. The citizens generally are not interested in the housing of the better class of working men; they are quite satisfied that houses for that class have hitherto been and are still being abundantly provided by private enterprise, and that the Corporation have no reason to take any trouble about them. Mr. Motion, who may certainly be held to know more about the matter than most other men, distinctly says that there is no difficulty in finding houses at present for the industrious poor—the only class we need give ourselves any concern about.

But while this may be the case at present, there can be little doubt that more houses suitable for that class must be provided before long. These, however, should not be situated either at Oatlands or at Overnewton, but as near the spots where dilapidated houses are to be taken down as possible; and if no public company or private individual can be found to erect these much-needed dwellings for the poor, then let the Corporation undertake the task and solve the problem of erecting healthful houses of the cheapest class at remunerative rents in central localities.

The mere question of housing is, however, by far the simplest problem connected with the improvement of the slums. No one can have gone deeply into the subject at all without being thoroughly convinced of that, and while Dr. Murray's scheme would not be of any use in connection with the improvement of the slums, it is on many grounds as objectionable as the Corporation's wider scheme of erecting superior houses—a project which is quite inexcusable. For, as Dr. Murray can hardly fail to see, it would, not less than the Corporation's scheme, interfere with the development of private enterprise, which hitherto has been quite able to provide liberally for the accommodation of the better class of working people, and which, if brought into competition with a privileged association getting land at less than cost price, and money at less than the current market value, must necessarily be curtailed or entirely stopped. At the last census it was found that over

7,000 houses were unoccupied, and the margin is probably as great now as then. In these circumstances, what is said about the extreme rents charged by greedy landlords is evidently absurd, as the competition must be, not for houses, but for tenants, which makes all the difference in the world.

If, then, the privileges desired by Dr. Murray resulted in the suggested company being able to let their houses at lower rents than houses built by other people, the result would be not beneficial to the community, but disastrous.

THE FAIR CONTRACTS CLAUSE.

THE special committee of the Manchester City Council appointed to consider the revision of Standing Order 18, Clause 4, known as the Fair Contracts Clause, have proposed the following substitution for the existing Clause 4:—

"Contractors tendering for or executing work under this Council must be paying to the whole of their workpeople (except such as on account of old age are employed at a lower rate) the standard rate of wages in the several districts where their workpeople are actually engaged in the execution of work, and must also be observing the hours of labour as well as the aforesaid rate of wages as respectively agreed upon between the associations of employers and the local organised bodies of workers in the various trades in the several districts where the work is being done. No tender shall be accepted from any firm which prohibits its workpeople from joining trade societies.

"Should the Council have, in its opinion, reasonable grounds for believing that the above conditions are not being complied with, the contractor shall be required to produce proof (to the satisfaction of the Council) of his compliance with the said conditions.

"The contractor shall not assign or underlet the contract, or any part of it, or sub-contract, except with the consent of the Council and upon such conditions as it may think fit; but if the tenderer at the time of tendering states his desire to sublet any portions of the work not usually done by him, the Council will consent provided that the sub-contractor is a person approved by it; the principal contractor shall be responsible, however, for all work done by such sub-contractor, and for its being carried out under the same conditions as if executed by himself.

"Clauses embodying the various points herein named shall be inserted in all contracts for work, and contractors shall be

required to signify their assent to them in writing. Failure to comply with any of the conditions set forth in such clause shall leave it within the power of the Council to cancel the contract.

"This standing order shall not apply to purchases by contractors of materials or patented articles, or of stores and miscellaneous articles."

With a few verbal alterations effecting no material change it was agreed to recommend the Council to adopt this.

The chief alteration lies within the first paragraph, and an effort to render more explicit the statement that contractor "must be paying the standard rate of wages to the whole of their workpeople, and observing the hours of labour recognised by the local bodies of workers in the various trades affected in the districts where such work is being executed."

The following is a copy of a draft amended fair-wage clause for a building contract which was submitted by the President of the Manchester and Salford Master Builders Association to the Corporation committee:—"Contractors executing work under this Council must pay to the whole of their competent or qualified workpeople the standard rate of wages and observe the hours and conditions of labour recognised by agreement between the local organised bodies of employers and operatives in the trade rules and established trade customs of the district where the said workpeople are employed, and must not prohibit their workpeople from joining trade societies. Should the Council have reason to believe that these conditions are not being complied with, they may require the contractor to conform to the said conditions, after giving him notice to that effect; and should he fail to comply with or continue to disregard the said conditions, they may give him one month's formal notice in writing to comply therewith, such notice to give full particulars of any alleged breach of these conditions, and should he not do so after the offence has been proved, they may impose a penalty not exceeding £ per week so long as the offence may continue. The contractor shall not assign or underlet the contract, and shall not sub-contract without the consent of the Council; but if the contractor states his desire to sub-let any portions of the work not usually done by him, the Council will consent, providing the sub-contractor is an approved firm. The principal contractor shall be responsible, however, for all work done by any sub-contractor directly employed by him on the job, and for its being carried out under the same conditions as if executed by himself."

THE WEEK.

THE retirement of Sir WILLIAM ABNEY from his office in South Kensington was signalled on Tuesday by the presentation of a portrait bust to Lady ABNEY. There can be no question about Sir WILLIAM'S services. Apart from his efforts to reform the Royal College of Art, he has done much towards the application of the science of light, and especially in the improvement of photography. It is also to be remembered that along with Dr. RUSSELL, Sir W. ABNEY carried out a lengthy series of experiments dealing with the physical effects of light on water-colours. They demonstrated that mineral colours are far more stable than vegetable colours; that if moisture and oxygen could be excluded water-colours would have a longer life than they enjoy when freely exposed to the atmosphere of a room. The artificial lights employed in illuminating a room or gallery were found to be less deleterious than had been imagined. It would take a century in galleries lighted like those at South Kensington before any marked deterioration would be visible. But when the light is incandescent an exposure of some thousands of years would be necessary. The investigation of the nature of the chemical changes involved in the fading of pigments was left to a second report which has yet to appear. The hope was expressed by Sir JOHN GORST on Tuesday that Sir W. ABNEY would not abandon his work altogether at South Kensington. A great service would be rendered to art if the contemplated report were completed and published. There would also be opportunities to introduce, if necessary, any modifications which might be made requisite by the improvements in illumination effected during the last fifteen years.

WHEN Coopers Hill College was established the students, as well as their parents and guardians, anticipated fortunate careers in India. Railway and other engineers who had had some experience on Indian public works were not so sanguine. But grumbling is a characteristic of disappointed officials everywhere. The students worked hard, passed their examinations and went to the East with the confidence of Government servants. They found on their arrival that the three P's, Pay, Promotion and Pensions, were delusions. The ordinary civilian engineers, and we may add architects, also discovered to their dissatisfaction that they were to be little more than assistants to military engineers, to whom fell all the desirable rewards of the service. The Coopers Hill men had been instructed to believe they were of a different class, and would be placed at least on a level with military engineers. The Government of India, being apprehensive of the effects of discontent among holders of important positions, have recommended fair play, or, in other words, that the promotion and emoluments will correspond with what was held out to the students. The India Office, on the other hand, say that if there is a grievance the sufferers can apply to the law courts, that the fault lay with Sir G. CHESNEY, who over-recruited the service, and that the requirements of the War Office are compulsory. What is now desired is that a Select Committee be appointed to consider the grievances alleged by the senior Coopers Hill engineers belonging to the Public Works Department of India to exist, as a consequence of their promotion and emoluments falling short of the expectations held out to them when they entered the service. The House of Commons will not, however, agree.

THE French Minister of Fine Arts has acted wisely in ordering an inquiry into the circumstances which led to the purchase of the gold tiara in the Louvre. It is also right that this inquiry is to be entrusted to one of the humbler class of judges, in fact, a kind of police magistrate. The difficulty of the case is increased by the number of claimants for the position of culprit. It is further complicated through some of those men having publicly denied on other occasions that they co-operated in any way with the production of the crown. It suggests modern cynicism that in Paris forgeries of works by French masters have been exhibited as what they are. The judgment of connoisseurs and others is so little valued that a genuine example of one of the masters

of landscape art has been sent to the Salon in the hope of its rejection. A similar joke has been attempted in New York, where models which were copies of forms by MICHEL ANGELO and LEONARDO DA VINCI were submitted to the Art Commissioners. But the last legend has been denied. It has been believed there is an epidemic of crime at times, and it is not impossible that sundry other attempts to entrap the wisest may be made.

At the present time, when the question of finding accommodation for the humbler classes receives so much attention, the National Housing Reform Council have aided the cause by issuing "The Housing Handbook," by Mr. W. THOMPSON, a member of the Richmond Town Council. From it the reader can realise what has been done to meet the demand for block dwellings, cottage dwellings, cottage flats, lodging houses and tenement houses throughout the country. Plans and views are given as well as information about the reason for building. In addition are set forth such documents as Acts of Parliament, by-laws, rules and regulations, &c., and the book is, therefore, entitled to be called "A practical manual for the use of officers, members and committees of local authorities, ministers of religion, members of Parliament, and all social or municipal reformers interested in the housing of the working classes." Mr. THOMPSON must be an enthusiast to have worked so hard in the compilation of the handbook. No architect ought to undertake the preparation of plans for cheap dwellings until he has examined the various attempts exemplified in the handbook.

STANLEY GROVE, in Manchester, will present a remarkable appearance when the new infirmary is erected. It will become a medical quarter. The estate was presented to Owens College by the Whitworth trustees. A part of it had been intended for the erection of a southern hospital, but that portion will be transferred to the infirmary trustees. It will be possible to build not only a much larger infirmary than existed at Piccadilly, but if, as is likely, the pavilion system should be adopted, the buildings can be separated by an adequate amount of open space. The Council of Owens College, who are parting with the ground, have proposed some conditions or requirements which will of course be acceded to.

KINGSTOWN is the first part of Ireland with which the majority of visitors gain an acquaintance. THACKERAY thus describes its appearance in 1843:—"The better sort of houses are handsome and spacious, but the fashionable quarter is yet in an unfinished state, for enterprising architects are always beginning new roads, rows and terraces; nor are those already built by any means complete. Beside the aristocratic part of the town is a commercial one, and nearer to Dublin stretch lines of low cottages which have not a Kingstown look at all, but are evidently of the Dunleary period." Dunleary was the old name for the place prior to the visit of GEORGE IV. The contrast which THACKERAY noted between fine terraces and rows of cottages has become more marked. The cottage property is now mainly slums, and the condition of the poorer quarters of Kingstown is enough to strike terror into the hearts of sanitarians. Application was lately made for authority to raise a loan of 72,000*l.* to be expended on artisans' dwellings. Unfortunately during several years Kingstown has been unable to meet its expenses, and it is doubtful whether an additional burden can be sustained. The difficulty is increased by the fact that the leases are expiring, and the tenants, if they care to remain, will not only be required to pay rents vastly higher than those which prevailed when the town was in an experimental state, but will also have to expend sums on improvements almost equivalent to the cost of rebuilding. There is no doubt that much of the slum property could have been utilised as sites for a far better class of houses, but the leases and sub-leases were obstacles to the acquirement. The Local Government Board have therefore great responsibility, for although the houses proposed to be erected by the Urban Council would not be tolerated if unsupported by authority, the repayment of the loan is less certain than is desirable.

STUDIES OF COSTUME: ROMAN.

THE DISMISSAL OF AN ARCHITECT.

THE judgment by Mr. Justice WALTON on Friday last in *WATERMAN v. London (Riverside) Cold Storage Company, Ltd.*, is of importance to others besides the architect who was the plaintiff in the case. Although we hear much about the defects of the profession, there are very few precedents to guide a judge when, as on the occasion in question, a claim is made by an architect for damages arising from dismissal. Mr. W. H. WATERMAN sought 1,108*l.* 0*s.* 11*d.* for wrongful dismissal and balance of fees due to him. A dispute arose between him and the company about the underpinning of a wall of a wharf. The directors of the company came to the conclusion there was a breach of duty, and Mr. WATERMAN was dismissed. According to Mr. Justice WALTON, it is required in such circumstances to prove that an architect was either unwilling or unable to perform his duties. The directors had failed to do so, and his Lordship accordingly gave judgment for 953*l.* 11*s.* 9*d.* As certain calls on the plaintiff as a shareholder as well as payments by the defendants were taken into consideration it may be said that judgment was given for the sum claimed, which was a satisfactory conclusion.

Mr. Justice WALTON's declaration of the necessity of such grounds for dismissal as unwillingness or incompetence to perform his duties removes a misgiving which has existed to some extent about the status of an architect. In the majority of instances there is no special agreement with a building-owner about the duration of the term of the architect's employment. It is taken for granted that he will be permitted to exercise his skill until the completion of the building and the fulfilling of all the conditions in the contract with the builder. In the formal agreement with an architect which is introduced as a model in Lord GRIMTHORPE's "Book on Building," from being in use by the Commissioners of Works, it is said that if only a part of the works should be carried out the architect shall be entitled to a proportionate part of the remuneration, which is to be a fixed sum agreed on beforehand. If the architect become incapacitated he, or his representatives, shall hand over to the Commissioners all plans and papers relating to the works, and shall be entitled to such equitable proportion of the unpaid part of the said remuneration as may be agreed on. Disputes are to be settled by an arbitrator appointed by the Treasury. That agreement relates to an unusual variety of procedure. The architect is by it recognised as no more than a designer who is to prepare sketch plans, elevations and specifications, all of which documents are to belong to the clients. But in ordinary cases an employer can act towards an architect as he would towards any other agent and determine the engagement at any time without notice. The architect has, of course, his remedy in an action for damages, when it will be necessary for the employer or building-owner to prove, as Mr. Justice WALTON said, unwillingness or inability to perform the required duties. It is, however, not always possible for an architect to enter on a law suit, and one may be avoided by his simply stating in a letter that the writer is prepared to give his services as architect in connection with the building until it is properly erected and completed for such fees as have been agreed upon.

Building-owners, when they desire to act in an arbitrary manner, and take revenge for some slight or imaginary wrong by summarily dismissing an architect as if he were no more than a dishonest servant, fail to realise that they have only the power to partially dismiss him. By entering into a contract the employer has created a dual office for the architect, in virtue of which he becomes an arbitrator or judge to whom the creator of the office becomes subjected. The building-owner may take steps, for instance, to prevent the architect entering on the works in progress, and he might even put up a printed notice to that effect. But the rights of the architect cannot be set aside in that way, for the contractor can insist on his (the architect's) admission to the premises at any time and under all circumstances. A building-owner can, of course, set the law at defiance and incur pains and penalties for his own gratification, but he has only to consult a solicitor in order to discover that the dismissal of an architect is a more serious affair than is imagined. It is possible, as was the practice of the Commissioners of Works, the admired of Lord GRIMTHORPE, to regard the architect simply as a designer. Then, of course, he would have no more claim in virtue of his office to go upon works than the designer of a piece of cotton would possess to enter a factory and interfere with the printing of the pattern. But as soon as a contract is taken in building the architect becomes not only a designer, but much else.

Another case which was heard last week before Mr. POLLOCK, an official referee of the High Court, at Durham, partially resembles that we have just noted. The dismissal was expressed by a demand for the surrender of plans. The plaintiff, Mr. WILLIAM PERKINS, architect, sought to recover 580*l.* from the Bishop Auckland Co-operative Society. The province of such bodies has of late been widely extended. The defendants, in addition to the usual business of competing with ordinary shopkeepers, entered upon building speculations. In 1895 Mr. PERKINS was engaged as architect, the terms being, on works of the value of 1,000*l.*, 5 per cent.; from 1,000*l.* to 2,000*l.*, 4 per cent.; 2,000*l.* to 5,000*l.*, 3½ per cent.; and from 5,000*l.* to 10,000*l.*, 3 per cent. Various works were carried out, including houses and stables. There was occasional friction between the architect and the contractor, but the Society generally took the architect's view of whatever matter was in dispute. To his surprise Mr. PERKINS, on July 7, 1900, received a letter from the secretary of the Society intimating that the committee had become so dissatisfied with his conduct that he was instructed to ask him to deliver to the Society all plans and specifications of buildings erected for them, together with a statement of account, with a view to a final settlement. Mr. PERKINS replied he was unable to understand the letter, but as it had been sent he could not accept any further work from the Society, although he should take his part in seeing that the contracts entered into were carried out. Afterwards he furnished his account, and was informed it would not be paid until his plans were handed over to the Society. In another letter it was stated that his account had been submitted to the solicitor of the Society, who had recommended that 500*l.* should be offered in settlement of a claim amounting to 690*l.* It was added that if Mr. PERKINS did not accept

the offer the money would be paid into Court, and then a writ would be issued for the recovery of all papers and documents—that is to say, the plans which it was asserted belonged to the Society. The question of ownership thus appears under a new phase, and other architects would do well to secure themselves against similar demands by making their clients clearly understand at the beginning what is the usual practice.

It might have been possible to have the dispute between the parties compromised on equitable terms but for a circumstance which arose inopportunistically and which created a prejudice against the architect. There is so much said about illicit commissions and the tendency of architects especially to insist on them that the least pretext for suspicion is often sufficient to convince people that a wrong has been committed. Mr. PERKINS had, it seems, a running account with a firm of ironmongers, and he was allowed 10 per cent. on all articles debited to him. In one of the contracts for houses 200*l.* was entered to provide fireplaces. In another instance the amount for similar articles was 292*l.* The order for them was given to the firm. Plaintiff brought an action against the ironmongers for 33*l.*, which he alleged had been paid in excess, and the firm counter-claimed 89*l.*, an excess of commission which they had paid. Mr. PERKINS believed he was entitled to take the part of a contractor and receive the trade discount paid in ordinary cases. But no sooner was the report of the action in the papers than the Co-operative Society informed Mr. PERKINS that after the revelation they could not be parties to any arbitration in respect of his fees. He replied he was willing to have all his dealings with tradesmen investigated, but the defendants may have thought that he would be afraid to bring an action in the High Court. His counsel advised that the commission should be paid into Court, and that was done. But the Official Referee said that although the action might have been honest the retention of the commission could not be justified. After Mr. PERKINS had been cross-examined an arrangement was arrived at. It was agreed that plaintiff was to receive 350*l.*, and that each side should pay their own costs.

It is evident in this case that the issue was affected by the commission which was given by the tradesmen on account of fireplaces. Whatever may be the custom in the northern parts of England, there is no doubt the receiving of any commissions unknown to an employer is to be reprobated. Here, as in other instances, no loss arose, for if the architect was paid the contractor was not, and there was no allegation that the articles supplied were of inferior quality. Public opinion is, however, becoming more and more unfavourable to secret commissions, and architects are most unwise who will jeopardise their position for the sake of a small sum, but which when discussed in Court assumes alarming proportions.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VIII. (continued).

IT is a favourite device of some architects, when dealing with a lofty façade, to mask two storeys behind one height of window; but this cannot be commended, whatever plea may be advanced. Where a Mezzanine* floor is introduced the objection is still valid, though perhaps less forcible. In buildings such as club-houses, hotels, &c., there are many rooms required of less height than others by many feet, and where, indeed, it would be inadmissible to carry them to the same height as the principal rooms; and the latter being dispersed over two or three floors, the smaller rooms are worked in double stages. Fig. 65 may make this clear. Cloak-rooms and teachers' rooms in Board schools are often so treated, the cloak-rooms being level with their own departments, and the teachers' rooms being treated as mezzanine-rooms, the one being placed over the other in the inclusive height of school and classrooms.

* Der. Mezza = between, and nino (a diminutive); therefore = a little floor between principal floors.

PALLADIO is usually credited with inventing the "Colossal order" of columniation, the gigantic columns extending for two or more storeys. The main object in the use of these and of gigantic windows is to avoid frittering a lofty façade; as a result, the different storeys are apt to appear dwarfed. Aesthetically, there is not the same objection to the use of colossal columns as there is to "masking windows"; but it can scarcely be commended as the highest form of art.

Plan of Mezzanine

FIG. 65.

Bearing on the subject-matter of this chapter is the objectionable use of sham windows for the maintenance of symmetry. The writer, in the course of his experience, has met with many instances of this abomination; dummy windows are not, however, in the same category. For example, if a plan necessarily involved an arrangement for lighting, such as that shown in fig. 66, and if it were

The Use of Dummy Windows.

FIG. 66.

deemed advisable for the sake of balance or of quasi symmetry to set in the brickwork along the blank portion of the wall at A..A to agree with the window-reveals at B..B, there would not be any objection, nor would any deception be practised. But sham windows are those that

Plan of Sham Windows existing at Great Ealing School.

FIG. 67.

are set in close imitation of glazed sashes, &c., against a blank wall, either in continuation of, or else to balance, a real window (see fig. 67). Similar treatment was often accorded to doors, and amongst other sinners may be noted the Brothers ADAM, whose sham doors and windows dis-

grace, even whilst decorating, some of the houses in Fitzroy Square, London. St. James's Square, in the same city, has a similar abomination in one of the houses; but as an example of pseudomania, the house whose plan is shown in the accompanying fig. 68 takes a foremost place. It is a curious old house, unpossessed of a principal staircase,

still further modified to meet the artistic requirements of an elevation, by transposing two or more rooms or areas, as long as it can be effected without serious detriment to the plans. The maxim to be regarded in adaptations is that *what is of chief importance must hold sway over matters of minor import*; thus, to give to a morning-room or breakfast-

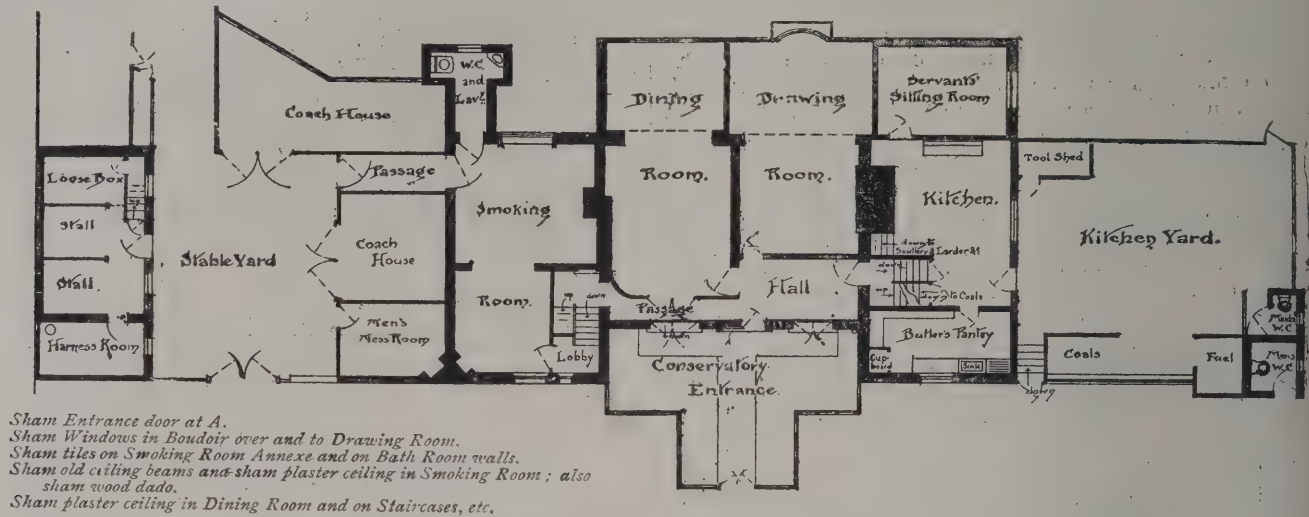

FIG. 68.

but having two of equal "value" (the word "importance" is inappropriate). It came under the hands of the author professionally, and he was thus able to study its weaknesses. It is not at all exaggerating matters to say that it would be unsafe to swing the proverbial cat on either staircase; but small and unimportant as the house is in itself (though it stands in a nice little messuage), there are enough shams and "features" crowded in it to share amongst many and larger properties—sham doors, windows and other accessories, both constructive and decorative, sufficient to demoralise any architect.

The plans of a building will frequently admit of certain modifications for the purpose of helping out the design; but it can only be on minor points, principally with regard to size and disposition of some of the windows. For example, and merely as an illustrative possibility, consider a plan façade such as that shown in fig. 69. It may be that the bay at A is decided upon as being altogether

FIG. 69.

desirable, and as belonging to one of the principal rooms is set central with the side in which it appears. The architect (or perhaps the client) may have a predilection for a symmetrical front, consequently a similar window is given to the study, and is disposed symmetrically for the façade, though it entails a lop-sided arrangement for the smaller and less important room. And furthermore, through the same desire for symmetry, the porch might be treated as shown, where, under other circumstances, a full width opening might have been accorded. Such treatment can only have any importance as affecting the elevation, for the internal planning would have been more pleasing if treated as shown in fig. 70. This is a simple illustration, for the purpose of making the point quite clear.

Instances may occur in practice where the plan may be

room north to west aspect, instead of south-east or easterly, in order to cope with some artistic difficulty of elevation, would not be a permissible modification; but the demands of art *might*, at times, justify a modification, substituting a more southerly aspect.

Planning for Internal Effect.

FIG. 70.

Another way of obtaining justifiable modifications is by the architect boldly rejecting some pet or self-approved planning (where he may find it impossible to obtain passable elevations), and substituting a rearranged scheme. This is, of course, a drastic method, but the advice is not to be considered a mere form of words, introduced for the purpose of suggesting alternative methods; it is, in fact, an experience with which any architect may meet.

It is of importance in the earliest stages of a scheme to have a clear idea whether the intention is to design on a Classic, a Gothic, or a Renaissance basis, for the closer the approximation to any particular type, the more successful will be the realisation of the best ideals. There may be some form of plan that acts as a common meeting-ground for all styles; but, by its adoption, typical effects are less easily produced. Bearing this in mind as a background, it may be said that according as the intention is to produce a Gothic, a Classic, or a Renaissance design, so is the plan in outline unrestricted, or more or less restricted. It does not, however, follow from this that symmetrical Gothic plans and unsymmetrical Classic ones are impossibilities (the former, more particularly, are of not infrequent occurrence), but in dealing with principles it is necessary to propound broad generalities, and to leave specialising for individual treatment.

Modifications in design and execution in matters of art may fairly be compared with the military strategy and tactics of a competent general in the field. He prepares

his scheme for obtaining the desired result on certain lines that should meet the requirements of the case; but, if he is confronted at any stage with unforeseen complications, he will then modify his original views to the necessary extent. This military simile may, with advantage, be carried a little further. Where military blunders are made, such as the two historic charges of light cavalry brigades (the one in the Crimean War of 1854-55, the other in the Soudan Campaign of 1898), the brilliancy of the *coup* does not excuse the original blunder. Marshal CANROBERT, on the earlier occasion, remarked, "C'est magnifique, mais ce n'est pas la guerre." Similarly with some architectural blunders—as for example, the Albert Memorial, London.—people may say, "C'est magnifique, mais ce n'est pas l'architecture."

Another cause of modification may arise when the principle of "solid over solid, void over void" is observed. This is apt to fetter a scheme considerably. Constructionally, there cannot be any valid reason for necessarily placing solid over solid, nor indeed for placing void over void; æsthetically there may be something to be said in favour of this principle, though it is apt to produce a very cold and strait-laced effect. The greatest objection to the indulgence of this principle arises from the hampering influences exerted (or liable to be exerted) over the plans.

Modifications of the plan, due to the formation of the site, may be appropriately referred to here from the effects produced on the elevations in many cases. The author believes that it was Mr. ALFRED SAXON SNELL who once called attention to the curious outlines of sites with which an architect is often confronted, and who observed that they called forth the ingenuity of the members of the profession to an admirable extent. That this is true is evident from a perusal of the plans reproduced in the professional magazines. Ingenious as are the modifications in plans in many instances, the accidental (or perhaps it should be incidental) "features" obtained on the elevations are as interesting.

In large towns and in growing districts, the value attaching to the soil necessitates obtaining the maximum of accommodation even on the smallest areas—in fact, the smaller the site, the greater is the importance of utilising it well. As a result, buildings are frequently placed on sites whose natural unsuitability (judging by the amorphous configuration) is only equalled by the dexterity which so often turns them to considerable advantage.

Many urge the importance of beauty in planning—in other words, the *æsthetic design of plan*. This is an entire misconception of correct ideals. A plan may indeed be beautiful on paper, and may receive the general encomiums of those who trouble to look at such plans (the encomiums will be more pronounced if the draughtsman adopts the somewhat meretricious effects of black filling for all sectional portions). But the mere beauty of a plan is not a guide to the practical value of the building; an ordinary-looking plan may, on the other hand, be entirely and practically effective. The point to be remembered—though generally forgotten—is that the actual and complete plan cannot be focussed into a view like the elevations, except in comparatively rare instances. Whilst beauty of plan may be considered as long as it does not necessitate any sacrifice of convenience, to go further would be equivalent to leaving the narrow path of honest conception for the broad avenue of false art.

(To be continued.)

THE SCULPTURES OF THE PARTHENON.*

IT would be an advantage to have records of judgments on famous works of art which were pronounced from time to time. Æsthetics is supposed to be a science; but if so, it does not rest on a firm foundation. We have shifting sand rather than granite. In consequence it is very hard to determine what constitutes beauty, and how far it is embodied in a building, statue, or painting. This inevitable uncertainty was exhibited in a marked way when the Elgin Marbles were offered for purchase by the owner.

* *The Sculptures of the Parthenon.* By A. S. Murray, LL.D., F.S.A., Keeper of Greek and Roman Antiquities, British Museum. London: John Murray.)

It was not discreditable to Englishmen that they were unacquainted with the character of the sculpture, and were doubtful about its value. Greece was then as little known to the majority of the inhabitants of Western and Northern Europe as Abyssinia is at the present day. The existence of temples was admitted, but the vaguest notions prevailed about them.

The Select Committee of the House of Commons appointed to consider whether it was expedient to purchase the marbles on behalf of the public had, therefore, a difficult problem before them. The feeling of the time is suggested by the statement in the report that "the testimony of several of the most eminent artists in this kingdom, who have been examined, rates these marbles in the very first class of ancient art, some placing them a little above, and others but very little below the *Apollo Belvidere*, the *Laocoon* and the *Torso* of the Belvidere." When it is remembered how many of the figures in the frieze are boys and maidens, besides numerous horses and oxen, it is not easy to realise how such a standard as was proposed could be applied. But in 1816 the *Apollo* was judged to be "the highest and most sublime representation of ideal form and beauty which Sculpture has ever embodied and turned into shape." Had WINCKELMANN been able to visit Athens and behold the Parthenon sculpture it is not likely that the supremacy of the *Apollo* would become an article of faith among connoisseurs. It is amusing when we read with what persistency the *Apollo* was brought forward to test the evidence of the witnesses. Old NOLLEKENS was asked whether the *Theseus* was as fine sculpture as the *Apollo*, whether it possessed more or less of ideal beauty than the *Apollo*, whether it was a closer copy of fine nature than the *Apollo*. The same questions were put to FLAXMAN, WESTMACOTT, ROSSI and others. It is superfluous to say there was much difference of opinion about the value of the Parthenon sculpture. WILLIAM WILKINS, the architect of the National Gallery, considered the pieces valuable for those who would have to ornament an architectural building, but as detached and insulated subjects they were not fit models for imitation. The mediocrity of the sculpture of the frieze he attributed to the position it occupied in the temple, for as it could only be seen with difficulty, a finer style was unnecessary. The importance of the figures in the eyes of a great many people he considered arose from the mistaken notion that they were the work of PHIDIAS, and he added, "If you divest them of that recommendation I think that they lose the greater part of their charm."

Among all the witnesses the most enthusiastic was BENJAMIN WEST, although his evidence had to be taken, as it were, on commission. The sculpture, according to the President, was in the first class of grandeur, grand and simple in composition, and although not executed by one hand, was pervaded by one mind. The equestrian groups in the frieze or procession were "without example in the energies of the horses, the grace and beauty of the youths who sit upon them, and the life which is to be found in all. The whole does not appear to be the efforts of the human hand, but those of some magic power, which brought the marble into life." WEST believed that RAPHAEL'S *Expulsion of Heliudorus* and the *Attila* and *Pope Leo the Great* were derived from the frieze, as information about the sculpture had been sent to the painter by his agents in Athens. The comparison with the favourite standards was made by WEST in a few words:—"The *Apollo* of the Belvidere, the *Torso* and the *Laocoon* are systematic art; the *Theseus* and the *Ilissus* stand supreme in art." Whatever were the shortcomings of WEST as a painter, much should be overlooked for the sake of the opinions which he gave the committee, and which, as he was the official head of English artists, must have carried weight.

It was, however, believed, especially on the Continent, that what really turned the scale in favour of the purchase was the advice of VISCONTI. He had been conservator of the museum of the Capitol in Rome, and NAPOLEON had appointed him to be chief administrator of the Louvre and professor of archaeology. His authority was reputed to be supreme on all questions relating to ancient sculpture. He came to England in order to examine Lord ELGIN'S acquisitions, and his memoir on them was translated and published as an official document.

It is consequently not a little remarkable to find the earliest treatise on the subject in 1816 bearing the imprint of JOHN MURRAY, Albemarle Street, as well as the latest, which is the work of Dr. A. S. MURRAY, the Keeper of the Greek and Roman Antiquities in the British Museum. A comparison of the two would serve to demonstrate the progress made in Classical archæology, as well as in æsthetics during a period of over eighty years, but we can only refer to a very few instances.

In 1816 there was an opinion, and it was expressed by WILKINS, that PHIDIAS never worked in marble. According to him PHIDIAS was called by ARISTOTLE *lithourgos*, in contradistinction to POLYCLETUS, who is termed a maker of statues, because he commonly worked in bronze. VISCONTI interprets ARISTOTLE'S criticism in an entirely different manner. He says that PHIDIAS was called *sophos lithourgos*—a skilful sculptor of marble, in opposition to POLYCLETUS, who is said to be simply a statuary, *andriantopoion*, since this latter artist scarcely ever employed his talents except in bronze. Dr. MURRAY does not attempt to define the amount or kind of work which came from the hand of PHIDIAS. He says that artist was renowned for the splendour and wealth of his imagination, and at the Parthenon his office was as director. The two writers refer to the competition between PHIDIAS and ALCAMENES, master and pupil. But while VISCONTI points to it as evidence that statues, before being placed in position, were exhibited in public for close inspection, Dr. MURRAY regards it as a proof that PHIDIAS had advanced on the same lines with his pupil, and likewise bestowed details on single figures which were not required if they were considered as parts of a great composition.

The west pediment of the Parthenon was adorned with a representation of the contest between POSEIDON, or NEPTUNE, and ATHENÉ. The drawing made by CARREY in 1674 is a record that the figures were then in a tolerably perfect condition. In the British Museum there is a torso of the statue of NEPTUNE which Dr. MURRAY describes as grand and true. VISCONTI says the style is sublime, and in the portions which have suffered the least injury the surface expresses the flexibility of the flesh. The ILISSUS, or god of the river in the plain of Athens, which is assumed to be the title of the angular figure on the left of the western pediment, is thus eulogised by Dr. MURRAY:—

He is excited by the contest of the two deities, and raises himself in his channel, pulling back his left foot and raising his right knee; his right hand has caught hold of an end of his mantle, dragging it forward, an action always significant of surprise in Greek art. The somewhat violent raising of himself has necessarily thrown the more mobile parts of the body into a confusion, which might easily have been indicated by a sculptor more expressively than here, but never with a finer conception and with just that degree of truth which is consistent with a lofty ideal. The massive bones of the chest and the ribs remain unchangeable, of course, however the body may turn. The task was to reconcile with them the easily changing forms of the abdomen. For ourselves, the way in which this has been done commands unflinching admiration.

The description by VISCONTI will bear comparison with the foregoing. The Italian wrote:—

This personage, half reclined, seems by a sudden movement to raise himself with impetuosity, being overcome with joy at the agreeable news of the victory of Minerva. The momentary attitude which this motion occasions is one of the boldest and most difficult to be expressed that can possibly be imagined. He is represented at the instant when the whole weight of his body is going to be supported by the left hand and arm, which press strongly on the earth, on which the left foot also rests. This motion causes the whole figure to appear animated; it seems to have a life which is found in very few works of art. The illusion is still more strengthened by the perfect expression of the skin, which, in several parts of this statue, thanks to its situation and position, has been better preserved than any of the others, and which one would be tempted to call perfectly flexible and elastic. If the fragment of a head with its hair in disorder, and bound with a cord or strophium, could, as a great artist supposes, be fitted to this statue, there would not, perhaps, be a more striking work among all the remains of Grecian sculpture.

The adjoining figures of the pediment still remain *in situ*, and they are supposed to represent CECROPS and his daughters with the boy ERICHTHONIOS. SPON absurdly fancied two of them to be the Emperor HADRIAN and his

consort SABINA. VISCONTI maintained the two were VULCAN and VENUS, although they would hardly be introduced in so remote a position in such a crowd. On the right side of the pediment the figures are thought to be the family of ERECHTHEUS, while VISCONTI was of opinion they represented AMPHITRITE, LATONA and her children.

The eastern pediment, it is generally agreed, commemorated the birth of ATHENÉ. Dr. MURRAY believes in a correspondence between the two compositions, viz. "a great central group of deities who were visible only to the inner eye, and two angle groups of secondary beings whom for the moment we may call merely interested spectators." Fortunately for us we possess some of the noble figures which by themselves are well worth the 35,000*l.* paid for the whole collection. One has been long accepted as a representation of THESEUS. The head is slightly defaced, and the feet and hands are absent. TAYLOR COMBE, we believe, was the first to suggest the figure was THESEUS. VISCONTI concluded it was a young HERCULES; not the popular hero, but an earlier being more ancient than ZEUS, of whom he had taken care during infancy. By others the figure was named BACCHUS, and it has also been taken for a statue of PAN. BRÖNSTED said it was CEPHALUS, the mighty hunter, the beloved of EOS. Dr. MURRAY is inclined to believe in the last theory. He points out that the proportions of the figure have been modified to suit its position. Taking "the middle line of the body to start from, we observe that the farther half is not only narrower than the nearer half, but is rendered in a quite general manner—not much more carefully, in fact, than the back of the figure, and in striking contrast with the marvellous beauty of the nearer side. Beautiful as is the structure of the bones of the right knee, which is farther away, it cannot compare with the charms of precise delineation in the bones of the left knee. Or if we measure from the collar-bone to an extreme point on each shoulder, we find a difference considerably greater than is possible in nature." It is in microscopic scrutiny of that kind that Dr. MURRAY'S book prevails over its predecessors. Having the marvels under daily observation he must be familiar with all their peculiarities. The two seated figures near CEPHALUS were taken for PROSERPINE and CERES. Dr. MURRAY prefers to consider them as two of the Horæ. The next figure, once known as IRIS, would then be the third Hora. Towards the angle to the right are three seated figures which must have been of marvellous beauty. VISCONTI assumed them to be the Fates who presided, according to Greek mythology, over birth as well as over death. But WELCKER deemed they were Parthenoi or Dew-maidens, and his view is supported by Dr. MURRAY. The reclining rather than seated figure, he says, is an object of study and admiration. He goes on:—"No wonder she has been sometimes called APHRODITE, nor that recently she has been compared with the *Aphrodite in the Garden* at Athens, by ALCAMENES, a work renowned for its elegance. She has even been claimed as herself from the hand of that favourite pupil of PHIDIAS. But whatever her charms, we must not forget that she is only a secondary figure in a great composition." Dr. MURRAY, we may add, is not opposed to the theory of the use of colour as an aid to the sculpture.

It may be only through the influence of association, but we suppose most lovers of Greek art will maintain that the metopes in the British Museum are superior to those seen elsewhere, or represented in CARREY'S drawings. The contest between the Centaurs and the Lapiths was a favourite myth with the Athenians. VISCONTI maintains that the human combatants were not Lapiths, but Athenians, who wear the same garb and carry the same shields as some of the horsemen in the frieze. He assumes that PHIDIAS was thinking of the groups painted by MICON in the Temple of Theseus, which was erected twenty years before the Parthenon. In other words, the moment selected was one where success remained uncertain. Dr. MURRAY believes that the number of metopes, in which we see only figures of women, was intended to suggest that the contest was but an isolated scene at the marriage feast. The sculpture is in high relief, and one of the figures, it was found, was attached to the background at a single point only. Remarkable skill is observable in some of them, but it is

difficult to resist the conclusion that sculptors of varying degrees of skill were employed upon the work.

It has been questioned whether the subject of the great frieze of the Parthenon is the Panathenaic Procession, and whether there was not more than one kind of procession represented. The complete frieze was 522 feet 10 inches long. If the metopes were included the sculpture extended for over 1,000 feet, in addition to the figures of the pediments. Lord ELGIN was able to obtain 240 feet 6 inches of the frieze. Several slabs have since been discovered, so that it is possible to compile a representation of 415 feet, or about four-fifths of the original work. Many of the slabs are broken at the corners. Dr. MURRAY attributes this to the fine jointing, which allowed of no play when there was a disturbance of the soil or on the occasion of the gunpowder explosion. Besides the figures in the procession and the officials acting as directors we see a number of beings who are seated. They are deities. It was pointed out by VISCONTI that numerous figures of the Parthenon resembled in pose some antique statues, and this he ascribes to the admiration for the works of PHIDIAS prevalent in Greece. Among the statues thus recalled is the broken figure known as the *Torso* of the Vatican, the *Ludovisi Mars*, the *Jason*, or *Cincinnatus*. There has been the usual divergence of opinion in designating the divinities. But to the Athenians there could be no difficulty. The beautiful boy leaning against a woman, which in Bishop WORDSWORTH'S opinion marked by its softness the turning point in Greek art and the indication of an approaching decline, is regarded by VISCONTI as ERECHTHEUS, the son of VULCAN and the Earth. But he is now generally considered to be EROS or CUPID leaning against his mother and carrying her open parasol. This parasol may seem out of place on such an occasion, but as an accessory it was useful for the identification of the goddess. The introduction of a boy god may not have been sanctioned by precedent. It was, however, effective as a link between Athens and Olympus. On looking at the procession in its present ruined state, with so many defaced figures, it is not difficult to imagine, unless we regard the figures attentively, that we have before us a grave ceremony in which elderly men bore the principal parts. But, taken as a whole, the procession is a glorification of youth, although we cannot now realise the effect it produced in its original state. How so much vigour was expressed, not only in equestrians but in oxen and horses, on such shallow slabs, is one of the marvels of Greek sculpture. The contrast with the metopes is surprising. The horses in the frieze are as suggestive of power as the bodies of the centaurs, but there is the greatest difference in the depth of marble available for the sculptors. We have also not merely a procession on one plane, but figures that are two or three abreast. As if to increase the wonder, charioteers are introduced, and while we gaze on them we are so fascinated that we do not think about the width of a chariot—and, indeed, questions of scale are entirely ignored. A modern dealer would be sceptical about the correctness of the representation of the horses, but, as VISCONTI remarks, they not only correspond with XENOPHON'S description of the horses which were most admired, but they prance and curvet in the manner considered as desirable.

To an Athenian the Parthenon would be incomplete without the statue of ATHENÉ. Tradition has established a closer connection between it and PHIDIAS than the rest of the sculpture. So much gold was employed, the sculptor was charged with having purloined a part of it. It has been calculated that the gold must have been worth at least 10,000*l.* or 12,000*l.* No figure has survived which can be assumed as a true copy of the work of PHIDIAS. But some statuettes have been found which, from their general resemblance to each other, may be taken as possessing some correspondence with the great statue. It is not a lovable ATHENÉ that is suggested by the face, but the stern features may have typified power, and given more confidence to an Athenian worshipper.

We have endeavoured to show a few of the characteristics of Dr. MURRAY'S book, by pointing out some of the differences between it and a work which was one of the means of persuasion employed by those who wished to see the Elgin Marbles remain in London rather than have them transported to Munich. But however grateful we may be

to VISCONTI, and however much we may admire the acumen which enabled him to draw so many sound conclusions from a short study of the marbles, it cannot be denied that he and his contemporaries were unable to give adequate illustrations of the sculpture. There was no draughtsman or engraver in Paris who could be as truthful as photography, and with such works truth is the essential quality. The dimensions we have given above show the enormous length of the sculpture. Incredible as it may seem, the representation of the frieze in Dr. MURRAY'S volume occupies over 20 feet on a separate folding plate. In addition are the metopes and many photographs of different parts. If it is remembered it was necessary to obtain illustrations of portions from Athens and from various other sources, it will become evident that the compilation of such immense plates was no easy task.

The Elgin collection is one of our national treasures for which we are envied, and in Dr. MURRAY'S book it is described for the first time with a detail and accuracy which can be accepted as trustworthy. KEATS, in his sonnet to HAYDON, regretted that he was unable to speak definitely of "these mighty things" and did not know where to seek what he wanted to know. With such a volume as "The Sculptures of the Parthenon" before him he would have had all the information he desired, and the pages are adapted not only for the poet and the classical student but for followers of the fine arts.

SURREY ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Surrey Archæological Society was held at Guildford on the 21st ult., when some interesting particulars were given of the excavations which have been continued during the year at the Cistercian Abbey at Waverley, near Farnham. Lord Middleton, who presided, said the task, when completed, would form the biggest and most important piece of archæological work ever done in Surrey. The Society of Antiquaries have just made a further grant towards the work, which is being carried out under the personal supervision of the Rev. T. S. Cooper and Mr. Henry Horn-castle. The most interesting discovery of the year is a second guest house of the same date as the later portion of the lay infirmary. The dimensions are nearly 44 feet by 21 feet, and the buttress bases and those of the central pillars are in excellent preservation. The building is to the west of the church and almost adjoins on to it, the entrance being on the south side, connected with a large courtyard having an important western gateway. The Society voted thanks to Mr. Rupert D. Anderson for allowing the excavations to take place, and granted a further sum towards the work.

EDINBURGH ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon the members of this Association paid a visit to Darn Hall, near Eddlestone. Permission was kindly granted by Lord Elibank and Mr. John R. Menzies. The house, which dates from about the end of the seventeenth century, occupies an elevated and secluded position in a romantic glen. The surrounding grounds have been laid out with great taste, and form a most pleasing picture. The place was originally known as Haltoun or Blackbarony. The house contains many fine family portraits. The party was under the leadership of Mr. Thomas Ross, architect. Votes of thanks were, on the motion of Mr. A. Hunter Crawford, accorded to Lord Elibank, Mr. Menzies and Mr. Ross. The party having partaken of Mr. Menzies's hospitality, visited the old churchyard, where there are some interesting tombstones.

THE ST. LOUIS EXHIBITION.

IN the exhibition to be held at St. Louis next year there will be a fine arts section, to which American artists may contribute such of their works as may be selected by the juries appointed for this purpose in the United States and abroad. In view of this fact and with the desire to secure adequate representation of the works of these artists, the chief of the Department of Fine Arts, Professor Halsey C. Ives, has nominated in London a jury of selection composed of American artists. The honorary secretary of the jury would be glad to receive the names and addresses of all such artists who—residing or having studios in the United Kingdom—may wish to obtain particulars as to forms, dates and the conditions of admission to the exhibition. All communications should be addressed to the honorary secretary, American Jury of Fine Arts in London, Sanctuary House, Tothill Street, Westminster, S.W.

NOTES AND COMMENTS.

BRIGHTON is not exactly the place where we should expect to find a flourishing technical school. But the Corporation can claim that kind of success. The engineering department especially is expanding at such a rate the technical instruction committee recommend that a loan of 3,500*l.* should be obtained in order to erect a workshop 75 feet by 42 feet. In the report it is said:—"The engineering department of the school is already a marked success. Working all day and every day are about fifty students, and it has interested the committee to find that these students represent very various social grades; young men from well-known public schools, such as Haileybury and Marlborough, working alongside students from York Place School and Steyning Grammar School, with a good proportion also from our own Grammar School and from Brighton College. Sons of clergymen, officers in the army and navy, professional men and tradesmen are competing on equal terms with those whose fathers are postmen, caretakers and artisans. The cost of the students is only about 18*l.* a year in fees and expenses, and each one earns for the school about 20*l.* annually in fees and grants." There would be little opposition to technical education if local authorities followed the Brighton example. The danger at the present time is that the students are led to suppose they need only amuse themselves, and that any skill they may attain is no more than an "accomplishment."

THE annual meeting of Ordained Surveyors will be held in Edinburgh on Monday next. The report of the Council states that at a special general meeting on June 10, 1902, a communication was submitted from the examining board desiring the opinion of the Society as to whether or not candidates should be required to do all their work in the final examination according to Edinburgh methods of measuring. The meeting resolved that it was inexpedient to insist upon the work in the examinations being done according to Edinburgh methods, that the examination should be a test of the candidates' knowledge of the general principles and practice of surveying, and that the examiners should satisfy themselves that the candidates' capabilities were such that they could, if necessary, apply the methods adopted in Edinburgh or elsewhere. During the past year three candidates presented themselves in April for the preliminary examination; two passed and one failed. In October one out of three failed. At one final examination there were five candidates from Edinburgh, Inverness, Kirkcaldy and Dumfries; two only passed. On another occasion three Edinburgh candidates came up; one passed. For the next preliminary examination there are eight candidates, and nine for the final examination. It has been resolved that the schedules and notes lodged by candidates in the final examination must be entirely their own work, and not schedules prepared for and signed by someone else.

TEGEA, which is about four miles from Tripolitza, was at one time of some note amongst Greek cities. The territory lying between those of the Lacedæmonians and the Mantineans, the people were compelled to be soldiers. But they were not neglectful of the arts. The temple of MINERVA ALEA, of which SCOPAS was the architect, comprised, according to PAUSANIAS, the three orders, but differently arranged to the modern practice for Doric was below, then Corinthian with Ionic above. DODWELL found fragments of the different orders, thus confirming the accuracy of the early description. The Doric columns, of which only parts were visible, did not appear to be inferior in size to those of the Parthenon. Their preservation was no doubt due to the weight and the difficulty of the removal. The lighter columns were, it is believed, carried from time to time to Tripolitza. On the front tympanum the legend represented was the Calydonian Hunt, and on the posticum the contest between TELEPHOS and ACHILLES. By order of AUGUSTUS, the ancient ivory statue of the Goddess, as well as the tusks of the famous boar, were sent to Rome. In Tegea was also a theatre erected by PERSEUS, the last king of Macedon.

The site of the temple has been explored by members of the French school, and M. MANTEL has been fortunate in discovering several examples of sculpture which a few weeks ago he was able to describe at a meeting in Athens. At the foot of Mount Aspis, in Argos, the French explorers have been also rewarded by the revealing of two prehistoric settlements, from which several examples of pottery were derived. The cyclopean structures of Argos were often mentioned by EURIPIDES as well as by later writers. It is stated by PLUTARCH that it was by means of the subterranean passes under the Mount CLEOMENES was able to enter Argos. From some inscriptions which were met the site of the temple of APOLLO DEIRADIOTES was indicated. It is only in Crete that English researches are of much account, for the Germans and French elsewhere have succeeded in obtaining the most fruitful sites.

ILLUSTRATIONS.

ST. GEORGE'S GARRISON CHURCH, WOOLWICH.

IF ever Romanesque should be revived the late THOMAS HENRY WYATT deserves to be considered as one of the pioneers. His fine church at Wilton exemplified an early attempt to acclimatise the style in England, and the building we now illustrate was the latest. It depends for effect in a large measure on the coloured materials employed in the interior, in which there is also a concession to engineering by the use of metallic construction. The marble and the mosaic decorations are on the north and south sides of the choir, and consist of inscription tablets of emperor's red marble surrounded by margins of alabaster and surmounted by panels of enamel mosaic. Above the tablets on the west sides of the piers of the sanctuary arch are two panels in Venetian enamel mosaic, one representing the Peacock symbol of the Resurrection, the other the Phoenix symbol of Immortality. Around the arch, north and south side, one leading to the vestry and one to the organ, are twelve narrow inscription panels of emperor's red marble, each separated by circles of Florentine mosaic, and above these the spandrels of the arches are filled with enamel mosaic; on one side the grape-vine with birds resting thereon, and the other side the Passion flower, also with birds.

The whole of the work was executed by Messrs. BURKE & Co., of Newman Street, and we understand the walls of the north and south aisles are to be similarly decorated.

SHEFFIELD DAILY TELEGRAPH OFFICES, FLEET STREET, E.C.

NEWSPAPER BUILDINGS, PORTUGAL STREET, W.C.

KNOLE HOUSE, SEVENOAKS, KENT: THE STONE COURT—FOOT OF GRAND STAIRCASE.

TOM DURFEY, in one of his doggerel verses, says "Knoll most famous in Kent still appears, were mansions survey'd for a thousand long years; in whose dome mighty monarchs might dwell, where five hundred rooms are." The place has a long history. In 1456 Archbishop BOUCHIER, who purchased the property, rebuilt the house and made it his residence. It continued to be one of the sixteen palaces belonging to the archbishops, until HENRY VIII. took a liking to it because it stood on sound, wholesome and perfect ground. CRANMER surrendered it to the king in 1537. It reverted to the archdiocese, when Queen MARY bestowed it on Cardinal POLE. DUDLEY obtained it from Queen ELIZABETH, who afterwards granted a reversion to SACKVILLE, Lord BUCKHURST and Earl of DORSET. He rebuilt and extended the house, and it continues to be in the same family. The structure has been altered from time to time, and may be said to represent the changes in Domestic architecture during four centuries. HORACE WALPOLE wrote of it:—"I worship all its faded splendour and enjoy its preservation, and could wander over it for hours with satisfaction." All who have visited the place would agree with WALPOLE. To illustrate the building would require some hundreds of plates. The portraits alone would be thought sufficient to impart interest to the building.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Slater, B.A., vice-president, in the chair.

The Hon. Secretary announced the decease of the late Mr. J. Bond Pearce, of Norwich, elected fellow in 1879, and Mr. S. Stenton Markham, of Guildford, elected fellow in 1856 and placed on the list of retired fellows in 1897.

Mr. H. PORTER, M.A., read a paper on

Fire Prevention and Fire Resistance.

He brought forward for discussion the question not only of the number and value of methods already devised for fire protection, but also of the extent to which these were available for practical use. The fires due to mechanical or constructional causes are the only ones we can hope definitely to prevent. These are worth careful consideration, both on account of their importance and also of the large extent to which they can be guarded against. The Glasgow fire returns for the years 1876-86, *i.e.* before the introduction of the Buildings Regulation Act, give 27·8 per cent. of the fires as due to defective hearths and flues, as against 9·65 per cent. in London during the same period. Defective hearths and flues account for a large majority of fires in the country, especially in old houses. All possible measures of safety in the construction, repair or alteration of chimneys and flues in country houses should be insisted on. In old London houses, too, the flues which were sound enough for the old-fashioned open kitchen range are found defective, in respect of their withes and chimney-backs, for the modern close kitchener, which creates great and concentrated heat. Timber mantelpieces constitute another source of risk from the way in which they are frequently fitted, with the metal of the grate touching the wood. In fixing the mantelpiece there is often left a small pocket in which soot accumulates, and may become ignited. A fire had occurred from this cause in a very expensive London mansion. Wall-plugs for joinery must also be regarded as sources of danger when near flues, especially in old houses where the pargetting of the flues has worn away and the joints of the brickwork have become open. Another risk is due to the practice of boarding-up unused fireplaces, or making them the receptacles of scraps of paper and other inflammable materials, which may easily be set on fire by a spark falling down the chimney from some other flue. The Glasgow Building Act compels all such fireplaces to be stopped up with incombustible material, and the chimney-top as well.

Fire prevention is only practicable in about 25 per cent. of our present outbreaks. Fire resistance, therefore, claims our most immediate attention. The degree of perfection to which this can be carried depends not only on the building itself, but also on its contents and immediate surroundings. This has to be kept in mind, as it is useless to expect owners to spend large sums on "fireproof construction" which they are perfectly aware will benefit their neighbours rather than themselves. The two chief elements in fire-resisting construction are:—(a) The materials used; (b) the general design of the building and details of construction.

As regards building materials, good brickwork is no doubt best for fire resistance. The chemical composition of the clay is the great element in determining both the fire-resisting and weight-carrying properties of a brick, which depend chiefly on the proportions of silica and alumina in the clay, and, secondly, on the oxide of iron, lime, magnesia, potash, &c. Terra-cotta used for structural purposes may be porous or hard-burnt. The porous is made by the addition of some combustible material, such as sawdust or finely-chopped straw, to the pure clay, which is then burnt under great heat. By this means the straw or sawdust is consumed, leaving the clay in a porous state. Hard-burnt terra-cotta is made from pure clay without the addition of any combustible substance. The porous form is non-conductive of heat, but does not carry weight so well as the solid, and if the straw or sawdust has not been thoroughly burnt out of it there is danger of disintegration under the combined effects of fire and water. The hard-burnt terra-cotta has to depend greatly on the hollow spaces with which the blocks are moulded, and is liable to crack on being suddenly cooled. For the protection of girders or columns, where it has little or no weight to carry, the porous form seems the best.

Discussing the fire-resisting qualities of mortar, plaster and cement, Mr. Porter referred to a series of tests with cement mortars carried out in Chicago in 1896. From these it was deduced that concrete floors might, after a fire test, hang together under heavy loads, but they are nevertheless weakened; to what extent depends upon the duration of the heat. Cement mortar can hardly be relied upon to resist high temperatures satisfactorily. Common lime and sand mortar in small quantities has probably greater fire-resisting properties than any other plastic material, and would be a better protection than cement mortar if it were strong enough to be used to a thickness of, say, 4 inches or more.

As regards concrete, tests have been made by which the material has been subjected to as much as 1,976 degrees Fahr. for several hours, and allowed to cool slowly, and also suddenly by application of water. The concrete composed of sand, gravel, or stone mixture crumbled, or gave signs of great weakness, while that composed of cinders showed good coherence, and did not suffer by wetting while hot. The highest degree of coherence was found in a mixture of one part cement to seven of coarse cinders. The conclusion is that where concrete has been made with care and knowledge, it will bear very high temperature for a long time, even with the application of cold water.

Wrought-iron, cast-iron and steel, although non-inflammable, are not good fire-resisting materials, and must be cased in some fireproof covering. Unprotected iron may not itself suffer by fire, but its expansion under great heat may cause serious damage to the building. Steel will expand 1 inch in 125 feet for every 100 deg. Fahr.

Combustible materials for the fitting-up of buildings should be used as sparingly as possible. Shelves might in many cases be made of wire-netting supported on metal uprights; counters might be constructed on the principle of fireproof doors and shutters. The use of wood, however, cannot be eliminated altogether. Careful tests seem to prove that wood can be so treated as to be made efficiently fire resisting; that the treatment does not injure it for structural purposes, and that its effect is permanent. But the process adds about 30 per cent. to the cost of joinery in soft woods, hence it is too expensive at present for general use.

Design, construction and fittings are the most important questions in the problem of fire resistance. Errors in design and construction will cause what might have been a small fire to spread over a large area and work practically unlimited destruction. The Horne Building fire in Pittsburg, and, though less destructive, the recent fire at the Haymarket Stores are cases in point. In both buildings the fire spread through a lift shaft which served as a flue on a large scale. The problem immediately before us is the treatment of all such vertical shafts or openings in the interior of buildings.

The author went on to consider the treatment necessary for the different purposes for which well-holes are required, dealing first with well-holes and light shafts; secondly, with well-holes for stairs and lift enclosures. The use of wire-glass in iron frames for skylights in well-holes is desirable, as it helps to prevent the fire from bursting through from below or burning embers falling in from above. Wire-glass withstands not only great heat, but also the sudden cooling when water is poured upon it. It is not only admirably suited for skylights, but also for warehouse windows overlooking narrow well-holes or streets.

Judged from the standpoint of fire-resisting design, the usual position of staircases and lift shafts in mercantile offices and hotels is wholly wrong. Such well-holes should be enclosed by fire-resisting walls, with access to large floors or corridors by doorways only, which could be fitted with fire-resisting doors. The walls enclosing well holes should be carried through and above the roof in the same manner as party walls, and the skylights over should be of thick plate-glass, or preferably wire-glass. Extra fireproof doors for stairs and elevator openings are recommended. To check the rush of flame up a shaft a system of automatic sprinklers might be fitted round the sides of the opening near the roof, or perforated pipes in connection with an outside stand-pipe would serve the purpose. A staircase made of oak or teak, with 2-inch treads and risers and soffits, and the spandrels filled in solid with some hard wood, the author thought, would be found the most reliable.

Subdivision of large areas, where possible, is an important consideration. A fire in a large undivided area increases both in intensity and volume with much more rapidity than in a smaller one. Where areas are divided into rooms or offices the partitions should be fireproof.

Fire-resisting floors the author classed as (1) concrete, (2) terra-cotta or brick. Some half-dozen exceedingly severe tests have been made of concrete floors, and not one of them failed. Experimental tests show that hollow tile arches of good design and not too long span have a strength sufficient to be safe under any load likely to be brought upon them in any ordinary building; also that their resistance to fire is entirely satisfactory, except that the dense tile is likely to go to pieces if struck by a stream of water when heated.

A satisfactory fire-resisting covering for columns and girders should be a non-conductor of heat, should be able to withstand the action of fire and water, should not break away from the column under the action of fire and water, and should contain no joints through which fire could find its way. The covering may be of plaster, concrete, brick or terra-cotta. Metal lathing should only be used where plaster is adopted for the covering material, and the column should be first wrapped with asbestos lining bound with wire.

The author next described the best forms of fire-resisting par-

titions, dealing with (1) solid plaster partition; (2) hollow plaster partition; (3) terra-cotta or porous brick partition. It is most important that terra-cotta partitions should start directly upon the masonry of the floor, and the terra-cotta blocks should be of sufficient width to secure stability.

Special attention was called to the importance of protecting all openings made through floors for the passage of pipes for steam, gas, or any heating apparatus, and private apparatus as aids for fire resistance—e.g., automatic alarms, automatic sprinklers, stand-pipes and hose—were briefly referred to.

In conclusion, Mr. Porter said he had tried to bring forward one by one the main features in the problem under discussion. The more carefully we go into it the more apparent it becomes that the real problem is not to be solved merely by devising further improvements in the details of materials, construction or design. We are already admirably equipped in these respects, and modern inventions are continually adding to our resources. Fire-resisting construction involves a considerable increase of expenditure, coupled often with a sacrifice of space and artistic effect. The practical problem for architects is how best to minimise these drawbacks. A useful basis for a discussion might be afforded by giving as a subject for a students' competition the designing of a hotel, retail store or mercantile house on fire-resisting principles, having special regard to internal effect in the first two cases, and in the third to economy of space.

Mr. H. D. SEARLES-WOOD read the following report of the science committee of the Institute on the fire offices' regulations for standard fire-resisting buildings:—

In 1898, after the Cripplegate fire, a conference of architects and insurance surveyors held two meetings with a view to ascertain what reduction of premiums the insurance companies would allow if buildings were constructed under the following conditions:—1. If buildings are flat-roofed, with hard fire-resisting material. 2. If floors of iron and concrete, constructional ironwork covered with fire-resisting material, say as required by the London County Council regulations, floors connected only by staircases, which, with the landings, to be enclosed by fire-resisting material, such as cement on metal core, now much used; lights in these partitions to be sheet plate. Teak or oak doors and treads and risers. 3. Similar floors, but pierced for lift, enclosing walls of brick rising through roof, and openings on each floor protected by light iron shutters. 4. Wood floors and joists pugged 4 inches between joists with some fire-resisting material pierced for stairs, constructed as in No. 2. 5. Pugged floors as above, with lift in addition, lift enclosed with fire-resisting partitions as stairs in No. 2, and with iron doors. 6. If the lighting areas or well holes common to buildings in different occupations be carried down to the basement floors and not roofed over by skylights on the ground floor. 7. If windows in front and back wall fitted with iron sashes and frames, but left without shutters. 8. If opposing windows, within, say, 20 feet, are fitted with iron shutters or some fire-resisting material for blinds. Any other heads or points which the offices may desire to note or which are set out in existing tariffs.

At a second meeting a tariff was submitted in which a normal building with a minimum rate was given, and the rate increased to meet ten or twelve different modes of construction. This tariff appeared to be in form and principle exactly what the committee had been endeavouring to obtain from the offices, and they were strongly of opinion that if the insurance offices regulate their premiums on any principle whatever and agree upon a tariff among themselves, that it is only fair to the insurers and their advisers that such tariff with clear definitions should be available for public use, but this was not agreed to. Since this conference some rules for standard fire-resisting buildings, dated February 1902, have been issued by the fire office committee, and the science committee have given them careful consideration. The rules are numbered 1 and 2. No. 1 applies only to cotton mills, flax mills, woollen mills and worsted mills. No. 2 gives rules for standard fire-resisting buildings, not including those scheduled above.

From a careful consideration of these rules it would appear that they have been drawn up without reference to the London Building Act, 1894, and in several points the rules differ from the provisions of the Building Act.

It would greatly facilitate business if these rules could be made to accord with the Building Act, and if the fire offices committee would draw up a tariff which would be available by the public where the normal building should be the type allowed under the Building Act, with ten or twelve varieties of construction or arrangement, whereby the normal rate would be reduced.

We recommend the Council to approach the fire offices committee, to ascertain whether they would meet a committee of the Institute to discuss these rules and tariff, with a view to making them workable. It is the general experience that the rules as at present drawn do not encourage fire-resisting construction.

Mr. T. BLASHILL, in proposing a vote of thanks to the

author, said the paper contained a good deal of matter which was a repetition of principles that had been dinned into the ears of everyone for a very long time, but he thought that it could not be dinned too often into the ears of architects and those who were concerned in the construction of buildings. In alluding to fire tests, the speaker said in his own opinion the tests were valueless. A great number of the tests were made by the manufacturers of the materials which had to be tested. Secondly, the material to be tested was usually drenched in paraffin, and the result could not be accepted as a test under ordinary conditions. There was a Fire Prevention Committee which adopted this fallacious kind of test, but he advised them in future to test materials on the same conditions as they would undergo if subjected to an outbreak from fire when in position. The tests that had been mentioned concerning fireproof floors were very valuable, but the point of greater interest to architects was the behaviour of the earlier fireproof floors. Information on the subject of the modern fireproof floors attacked by an outbreak of fire would be of value. The speaker deprecated the use of wooden floors, and he hoped that time would not be far distant when they would be able to put stronger legal pressure upon constructors in order to make buildings more fire resisting.

Mr. MEAD, of the Sun Fire Office, who seconded the motion, said it was greatly to the credit of this country that the proportion of incendiary fires was small. The offices could form such an opinion not only by the number of fires themselves but by the claims made afterwards.

Mr. LEWIS SOLOMON said the insurance offices after the Cripplegate fire offered little encouragement to the owners to rebuild with fireproof materials. Different owners approached the insurance offices asking for a reduction of premium if the rebuilding was carried out with fireproof materials, but the offices would not do this.

Mr. H. LOVEGROVE said sprinklers were an enormous expense and hideous because of the cistern required. It was doubtful if they were of real value, since in the event of an outbreak of fire the lower building would be deluged with water and the contents spoiled.

Mr. G. LEWIS BAX advocated the use of concrete as a fire-resisting material, and said there was no doubt that it would be more generally used.

Mr. MAX CLARKE said all discussions on fire prevention offered two points—the destruction of the building attacked and the safety of the inhabitants in danger. No discussion was complete without considering the lives of the people who were in peril from fire, and from accidents the result of an outbreak.

Mr. JOHN SLATER, in moving the vote of thanks, said fire prevention and fire resistance were two very different things. The accidental outbreak of fire could not be prevented, but the object of architects was to make the building, so far as possible, fire resisting. Sufficient stress had not been laid upon the importance of making roofs fireproof, which gave greater security to the building and prevented the spread of fire.

VENTILATION AND WARMING.*

(Concluded from last week.)

17. Position of Inlets and Outlets.

WERE it not for the law of gaseous diffusion there would be no doubt as to the best position of the outlets. The CO_2 being the heaviest (half as heavy again as ordinary air) would fall to the floor, and its withdrawal at floor level would be a necessity. In consequence, however, of the law of gaseous diffusion and expansion of the air due to the increase of temperature at which it is exhaled, causing it to rise, it is usual in natural ventilation to place the outlets for foul air at the ceiling level. We may, however, observe the following rules:—

(a) When the air is warmed before it enters the room it should enter at about 7 feet 6 inches above floor level, on the opposite side to the fireplace (if any), and pass out at the floor level on the same side of the room.

(b) When the fresh air is warmed by being heated in the room—by open fires, stoves, radiators, gaslights, &c.—it enters cold about 8 feet from the floor, and it consequently falls to the floor underneath the foul or warmer air that has been longer in the room and which should pass out at ceiling level. In fact it all depends upon the relative temperature of the air entering the room, as that is fresher than the air that has been longer in the room; if that is warmer than the air in the room, then there should be openings provided for the escape of the cooler and denser foul air at the bottom of the room. If, on the

* A paper read before the Society of Architects on March 19 by Mr. B. R. Tucker, member of the Council; (professional) member Sanitary Institute, and late Chief Surveyor, War Office.

other hand, the air entering the room is cooler than the air in the room, then there should be openings for the escape of the warmer and lighter foul air at the top of the room.

In inhabited rooms the windows should open as wide as possible for ventilation, especially for use during the summer months by day, and the bedrooms all the year round by night, except between sunset and bedtime, during when they should be closed to prevent the chilling of the room and its contents. They should be opened only on one side of the room to prevent cross currents which would cause a draught.

Air Space per Individual.

18. Natural ventilation requires more air space per individual than is the case with artificial ventilation. If the air in rooms is to be maintained in freshness equal, or nearly so, to that of the external air, the amount of cubic space must be well considered, or health vigour and mental activity must suffer. The result of breathing impure air is lassitude and sleepiness.

London School Board requires ...	130 cubic feet per scholar.
Common lodging-houses require ...	300 " " person.
Factories and { daytime ...	250 " " "
workhouses { overtime ...	400 " " "
Barracks ...	600 " " man.
Army hospital wards ...	1,200 " " patient.
Standard for living rooms ...	1,000 " " person.
Hospital wards ...	2,000 " " patient.

In buildings occupied for only a short period at a time, such as churches, schools, &c., the air space may be smaller than in buildings occupied for a longer period.

I might mention that it is now universally admitted that heat is wholly and solely motion—rapid movements of the molecules, the degree of temperature being regulated by the rapidity of the motion. This is called the kinetic or motion theory.

Systems of Heating.

19. There are three principal systems of heating rooms and buildings:—

- (a) Hot-water pipes, low-pressure, when the temperature does not exceed 212 degs. Fahr.
- (b) Hot-water pipes, high-pressure, when the temperature is about 350 degs. Fahr.
- (c) Steam—about 350 degs. Fahr.

Heat manifests itself in three ways:—By radiation, by conduction and by convection.

Radiation—I may say that all warmed air (obtained by warm-air apparatus) is debilitating. The best means of warming is by radiation from open fires, or by hot-water coils or radiators. Radiant heat (which passes through the air without affecting it) is supposed to be conveyed by ether, a subtle element which pervades all space. It should be borne in mind that bright surfaces will not radiate so much as those which are dull, such as those produced by dull lamp black. Radiant heat does not warm the air, it simply passes through it; it, however, warms the walls and contents of the room, and these in turn warm the air. Radiant heat from open fireplaces is only suited for small rooms, as it must be borne in mind that the power of radiant heat (like that of light) is only as the square of the distance.

Conduction.—This is the mode by which heat is transferred through a body. Water, fortunately, is a good absorber of heat, which it readily gives out again, but this would be of little avail were it not for the fact that the pipes and radiators in which it is usually conveyed are good conductors of heat; they allow the heat in the water to readily pass through them to heat the air in the rooms. Whilst we are indebted to iron and other good conductors for passing heat through them, we are at the same time, for heating purposes, indebted to bad or non-conductors of heat, such as fibrous material, air, asbestos, &c., for retaining heat, so that it may be conveyed a distance without loss. Confined air between double windows is a good example of its use as a non-conductor. The glass in a single window will cool the air of a room to about the same temperature as the outside air, at the rate of $1\frac{1}{4}$ cubic feet of air per minute for each superficial foot of glass it contains, whereas the glass in a double window, having 5 inches of air between the sashes, will increase the non-ductivity by about 12 deg. Fahr., which is considerable.

Convection.—This is of great interest, seeing that it refers to the transmission of heat from the place of its generation to that of its utilisation. Convection is due to expansion. In the case of water when heated the heated particles begin to expand and being lighter they ascend, and the colder particles being heavier they descend. By this means we get what is termed circulation, or motive-power, both in the hot-water and steam-heating systems.

We will now consider the various modes of warming.

Open Fireplaces.

20. The domestic open fireplace is the most popular. It acts chiefly by radiation. It is extravagant, as much of the

heat passes up the chimney; at the same time it acts as a good ventilator, consequently no inhabited room should be without a fireplace. The Teale slow-combustion grate and others of similar construction are an immense improvement on the register and similar patterns. Fireplaces should be placed in the inner walls of houses, where they warm the house generally.

Closed Ventilating Stoves.

21. These stoves are of great service in large rooms; they are more economical in fuel than open grates, and they distribute the heat much more satisfactorily. They are apt to get too hot, and by so doing burn the organic matter in the air and so produce an unpleasant smell. This description of stove should be lined with firebrick and have air-channels formed in it for heating the fresh air with which it should be supplied by means of a duct communicating with the external air.

Gas Stoves.

22. These stoves have come largely into use. They generally consist of a Bunsen burner which heats lumps of asbestos until they become incandescent. Until gas is supplied at about 1s. 6d. per 1,000 cubic feet (which it could be if required for heating purposes only) heating by gas stoves must be more expensive than by coals. Gas stoves should never be used unless they have a proper flue for removing the products of combustion. They are cleanly and very convenient.

Ventilating Grates.

23. These grates have an open fire and are constructed on the most approved principle; they have a chamber behind for warming the fresh air which is supplied by a duct connected with the external air. The air when warmed in the chamber is conveyed up a flue passing up beside the smoke flue, and escapes through a louvred opening in the chimney-breast. Galton's grate used in barrack-rooms is on this principle. They are most economical in fuel, as all the heat generated in the grate is utilised in warming the room. A certain quantity of heat, of course, passes up the chimney, but that is of service in assisting ventilation by causing the vitiated air to pass more freely up the smoke flue. As they warm only half the fresh air admitted into the room, they cannot over-heat the air generally so as to render it too dry.

Hot-Air Apparatus.

24. In this system the fresh air is admitted into a chamber (generally placed in the basement) where it is filtered and warmed by passing it through a stove, which should be of large area and moderate temperature rather than small, requiring a high temperature which would render the air too dry. After being warmed it is conducted along ducts of proportioned sizes and discharged through grated openings in the floor of the room. This method of warming is sometimes adopted in halls, churches and similar buildings. It is difficult to insure a uniform distribution of the air throughout the building. It requires great attention to prevent over-heating, by which the air would be rendered too dry for breathing. The warmed air is liable to some pollution by being conveyed through dusty ducts or channels on its way to the outlets in the floor. There is another and greater objection to this system of warming, it is that the air is warmer than the walls and furniture, consequently the bodily heat of the occupants is radiated to these, causing, as a consequence, a sensation of draught or chill, whilst the bodily resistance to chill is reduced by the enervating effects of warmed air. To insure the proper working of this system it should be assisted by hot-water pipes and radiators for the purpose of heating the surfaces of the walls and windows.

Hot-Water Low-Pressure.

25. This apparatus consists of a boiler usually placed at the lowest position; from the boiler cast-iron circulating pipes from 2 to 4 inches in diameter pass round the portions of the building to be heated. The principal circulating pipes are called "flow" and "return"; the former convey the heated water from the boiler, and the latter return the cooled water back to the boiler to be reheated. From these pipes the supply pipes to coils and radiators are connected. A supply cistern is placed at the highest point, to replenish any waste in the water and to admit of its expansion when heated. The water is seldom heated above 180 degs. Fahr., and never beyond 212 degs. Care should be taken to remove all air in the pipes by means of air vents or taps. This system is the most general in use; it is safe and efficient, easily worked and economical. It supplies a moderate wholesome heat, and there being a large body of water, the heat is more uniform than in any other apparatus. This system is the only one suited for horticultural buildings.

Hot-Water High-Pressure.

26. This apparatus consists of a continuous circuit of stout pipe, having an internal diameter of from $\frac{1}{8}$ to $\frac{3}{4}$ of an inch, according to the extent or magnitude of the installation. One portion of the circuit, from one-twelfth to one-sixth of its length

according to circumstances, is formed into a coil, which is placed in a stove or furnace, by means of which the apparatus is heated; the remaining portion of the circuit is distributed throughout the several rooms to be heated. The water when heated flows from the top of the coil in the furnace to the highest point of the building, and from thence back to the bottom of the coil to be again heated. Provision is made for the expansion of the water when heated by the insertion of an expansion tube at the highest part of the circuit. This expansion tube is so proportioned that it prevents an undue pressure on the pipes, which might cause them to burst. The expansion tube should equal about one-tenth the capacity of the pipes. The pipes are filled with water and then sealed up and tested to about 2,500 lbs. to the square inch. In practice they are often heated to 350 deg. Fahr., or 9 atmospheres, about 135 lbs. to the square inch.

The advantages of this system are that the pipes are small and neat and may be placed in positions where the larger low-pressure pipes could not be admitted for want of space, such as behind skirtings or in narrow spaces beneath windows. They can also be used for heating apertures for the admission of fresh air in almost any position not possible for larger pipes. The heat by this system is quickly raised in consequence of the small quantity of water it contains, and of course as quickly lowered should the fire slacken. This system is especially suited for drying-rooms and for japanning works. It is not suited for horticultural buildings. All hot-water systems have the advantage of supplying any modified temperature that may be required to suit the varying requirements that exist during spring and autumn.

Heating by Steam.

27. Although this mode of heating may not for general purposes be preferred to heating by hot water, at the same time it is especially suited for very high buildings, where the pressure of heating by water would be too great. Heating by steam is quick in its action; at the same time, should the fire slacken the heat quickly diminishes. Not so with the hot-water low-pressure system, where the heat is more retentive. Heating by steam is more difficult to regulate than by hot water. It, however, has one advantage, it is frost-proof; from the moment it ceases to act the pipes and radiators at once become empty. It is a very economical and useful mode of heating in factories, where the exhaust steam from the engine can be utilised. Heating by steam is very largely used in America. It has a great advantage in that it is suited for groups of buildings that may be considerably scattered or distant from the source of heat. The difference in volume between water and steam allows of smaller pipes, radiators, &c., being used in the case of the latter; consequently it is cheaper to instal. It is important to note that 1 cubic foot of water will produce about 1,600 cubic feet of steam at atmospheric pressure; also to bear in mind the important peculiarity in the quantity of heat required to produce steam—known as the latent heat of steam. To heat water from zero to the boiling point at atmospheric pressure requires 212 degs. Fahr., but to convert the water from boiling point into steam requires four to five times as much heat, although the steam will not appear to possess an increased temperature; however, on its being condensed to water, this latent or hidden heat is given out again and renders good service in the heating of buildings. The heat of the steam is utilised for the purpose of heating by its being condensed to water in radiators. The position and size of the radiators should be carefully considered; they should be placed under windows and in other positions where the greatest amount of cool air emanates. Care should be taken that the condensed water can freely flow back to the boiler, and attention should be given to details, as regards air in the pipes.

Calculating the Surface of Radiators and Pipes.

28. In calculating the superficial area of the pipes and radiators required to heat a room or building, both for hot water and steam, it is important to take into account the area of the glass in the windows, together with the cubic capacity of the room, at the same time taking into consideration the quantity of fresh air admitted per hour, thickness and nature of the walls, &c., and whether the building is exposed or not.

Small Rooms.

29. Open fireplaces of the modern slow-combustion type.

Large Rooms.

Open fireplaces having ventilating grates of the Galton type, assisted by radiators and also by coils placed in cases under the windows. Open stoves of the ventilating type might be substituted for the open grates if preferred.

Churches, Public Halls, &c.

Hot-water low-pressure, if practicable, employing radiators (enclosed in cases if desired) placed under windows and in other places where cool air is met. The heating of churches

and similar buildings requires great care. Usually the heating is by pipes inserted in ventilated trenches, situated in the aisles, and covered by iron gratings flush with the floor. The objections to this mode of heating are—at least 20 per cent of the heat is lost, resulting in a waste of fuel to that extent; also the open gratings admit quantities of dust and dirt, which lodge on the pipes, where they become burnt and so render the air insanitary. A more economical and better arrangement would be to heat the building by indirect radiators placed above the floor. Some should be placed in recesses in the outer walls; flues should be formed from the recesses to the sills of the windows above for the purpose of warming the glass in the same. The large west windows of churches would probably require two radiators of 100 feet superficial heating surface each. The clerestory windows might be heated by a pipe (high-pressure), supported upon a label moulding hollowed out for the purpose. Draughts in churches and similar buildings, which are so frequently the cause of a serious complaint, might be practically abolished if attention were paid to the warming of the glass of the windows, so that it practically offered the same resistance to the cooling effect of the outside air as do the solid portions of the walls of the building. Other indirect radiators should be placed in convenient positions so as to produce sufficient heat to satisfactorily warm the building. The hot-water high-pressure system should be employed in situations where space will not permit of large pipes or radiators being placed. Very high buildings and those placed at a distance from the source of supply of heat should be heated by steam, it being more economical and convenient.

THE RHIND LECTURES.

THE subject selected for this year's course of Rhind Lectures in Edinburgh is "Secular Buildings erected in Scotland from the Earliest Period to the Seventeenth Century." Mr. Thomas Ross, architect, and one of the authors of the works on the Ecclesiastical Architecture and the Castellated and Domestic Architecture of Scotland, is the lecturer. In his first lecture, he said the examples for the very early part of the subject were necessarily incomplete and fragmentary. There were probably no remains of pre-Roman dwelling-houses in Scotland, but there was evidence of great tomb structures, and the opinion was that these were a reflex of the houses. Although the dwelling-houses had thus perished, it was quite possible, and highly probable, that they survived in modern instances in remote places. The earliest surviving type of human habitation built of stone was probably the beehive house, of which there were several examples in the Western Highlands. They were of small size, 7 or 8 feet in diameter, and of a height sufficient to stand upright within, access being obtained by creeping in by the small doorway. An example of an early house from the Long Island showed a group of what might be called twelve beehive houses grouped together, some of which looked like single-roomed houses and others apparently of larger size. Another remarkable group, in the Bay of Skail, Orkney, consisted of a number of rooms or cells knit on to what seemed a common passage, and a modification of this existed at Stanabreck, North Ronaldshay; while at Howmae, in the same locality, there was a complicated plan of what appeared to have been two houses with some separate cells, a workshop and two places for cattle. It was evidently such places, as those that they found referred to by travellers in the North and in the South during the sixteenth and seventeenth centuries, although the examples cited were of greater antiquity. These houses had all a uniform construction, built on the surface of the ground, and with stones without lime or cement, and have converging walls and roofs of stone slabs. Drawings of several tombs and cairns were exhibited and described. Maeshowe, one of the larger chambered tombs, was a building of considerable architectural merit, and it was of great interest to know, from inscriptions, that certain Crusaders returning from Jerusalem to their homes in the North evidently took refuge within this place, and possibly it was pillaged by them, as nothing disclosing the original condition of the place was found when it was opened in the nineteenth century. The lecturer concluded with a brief reference to the underground houses found scattered over Scotland, principally on its eastern side. These kind of houses, he said, were well known, and their uses had been described by Tacitus.

In the second lecture it was stated, says the *Scotsman*, that the next group of prehistoric buildings to be described was that of the Brochs. They were the most outstanding and distinctive of all the early buildings, whether regarded from their size, their identity of plan, their great numbers, their distribution, or the almost total oblivion in which they were involved until about the middle of last century, when their remains began to be investigated. There were somewhere about 400 of them north of Loch Ness, and about half a dozen in the south.

They were thus mostly situated in the part of Scotland which was for several centuries under the power of the Northmen. The sameness of plan was remarkable. It was that of a circular tower, about 60 feet in diameter with walls about 15 feet thick, and their height was probably about 50 feet. There was one entrance on the ground level with one or more closing doors, fairly wide and high for a Celtic building. The interior was open to the sky, with a few small chambers in the thickness of the wall on the ground level with very small doors. The wide entrance on the ground floor indicated a provision for flocks and herds, and the small openings to the chambers seemed to show that they were excluded from them. Above these chambers a series of galleries, about 5 or 6 feet high, in the centre of the wall were continued round the structure, with a continuous stair in the centre, winding round from gallery to gallery. They were entirely built of stone without lime or cement. They represented great skill and labour in construction and a powerful Government able to impose such a great scheme of defence upon the inhabitants of an extensive area. It was now the universal belief that the Brochs were built as places of safety to which the inhabitants could fly on the approach of the ravaging Norsemen. They were peculiar to Scotland, no other people ever having built such defences. This era appeared to have been some time after the departure of the Romans. Roman architecture in Scotland could not be regarded as prehistoric in the sense in which the buildings hitherto referred to were. Still they had no mention of the erection of any works except purely military ones. Of course there was the express statement of Tacitus that Agricola in his first winter in the north induced the natives to erect temples, courts of justice, &c., but it was difficult to attach any express meaning to such a statement. With one solitary exception there was little evidence that the Romans erected buildings here of any architectural pretension till the Society of Antiquaries of Scotland began their investigations some few years ago. Altars and carved stones were numerous, but plans of buildings and precise descriptions were few. Now they had ground plans sufficient to show that they erected many and great buildings, some of which must have possessed distinct and pronounced architectural features. The exception just referred to was Arthur's Oon, or oven, which stood two miles north of Falkirk. It was destroyed in the eighteenth century, but had been described and illustrated by Gordon and Stukeley. The latter pronounced it to be the grandest Roman monument in Britain. It was a circular building, 29 feet in diameter, with a dome roof, and rose to a height of 22 feet. Of course, no such perfect building need be looked for now. All that could be expected were ground plans, with individual stones, moulded or carved—evidences of architecture—and of these all the camps excavated had yielded proof. The kind of buildings which might be expected to be found in the Scottish camps were now pretty well known, as they occurred with considerable regularity in all those excavated. There was the so-called pretorium in the centre, of possibly about 100 feet square. Flanking this on each side a long and narrow buttressed building—the granaries—and beyond each of these was another large squarish building, the whole frontage of these five buildings extending to about 400 feet. There was throughout all the camps a general agreement in the internal arrangements of these respective buildings, indicating a regular official mode of laying them out, as well as of the defences of the camp. Besides these stately edifices there were rows and rows of what were probably soldiers' quarters, extending to from 100 to 200 feet in length. These were sometimes constructed with stone walls and sometimes of timber. In almost all the camps many other buildings supposed to have been villas and baths had been found, a remarkable feature of which was the almost constant presence of apsidal-shaped rooms, several apses occurring in the same building. Many very complete hypocausts, with their pillars sometimes constructed of monolith dressed stones, and at other times of thin brick 8 inches square, had been unearthed, with their tile floors, and flues for conducting heated air; and in one instance—at Inchtuthill—a perfect bath, with its steps graduated and lead escape pipe. Inchtuthill was the furthest north Roman house yet found in Britain, situated north of the Tay, in a very perfect condition, and built in a substantial manner. Its discovery seemed to widen the field for future exploration. A remarkable find lately of architectural details, consisting of stone columns, carved and moulded capitals and bases, raised the hope that our knowledge of Roman buildings in Scotland might yet be considerably advanced. Although little more than a beginning had been made in the study of the Roman occupation of this country by an examination of the sites, sufficient had been done to show that it was only by this method that they could hope for any increase of knowledge on the subject, and many were looking eagerly forward for the results of excavations now on hand.

In the third lecture, having described the various kinds of buildings erected in Scotland in prehistoric times, of which there were no written accounts, the lecturer proceeded

to trace the progress of castle building during the Mediæval period. William the Conqueror secured and held his position, he said, by his rapid movements, and by the construction of temporary castles of timber and earth. Few castles of stone and lime were erected till about thirty years after his death, and most of the Norman keeps in England were built between, say, 1120 and 1180. These castles were built by the usurping Norman lords to defend their conquests, and were thus the outcome of circumstances which did not arise in Scotland. David I., whose reign of thirty years occupied most of the Norman keep building period, had no need of Norman castles to overawe his subjects, and the many Norman families who then came to Scotland appear to have met with little opposition. David was a great church builder, but not a castle builder, and during the twelve years' reign of his son Malcolm the theatre of events was outside the region where Norman influences prevailed, and the country being then in a state of comparative peace, Norman castles were not required, and the period of their duration in England was by this time almost past, and thus it came about that there were no Norman castles in Scotland, so that the first period of stone castle building in England was a blank in Scotland. But as a modified kind of Norman keep ultimately came to be a favourite with the nobility of this country, the plan and arrangements of Norman keeps were explained. While this period of castle building prevailed in England and Ireland also, and nothing similar was going on in this country, it might be asked what kind of castle was in use in Scotland, as, with such a state of society as the twelfth century presented, castles of some kind must have existed. In 1180 there was a reference to the "King's castle of Heryn" having been surrendered to his enemies. This had been identified as Dundurn, a rough, rocky hill at Loch Earn, which, strong by nature, had been rendered more so by the erection of thick uncemented walls. There was nothing about the place having any resemblance to a Mediæval castle, and yet it was called "the King's castle." No other kind of castle except the forts, moats and, it might be, the brochs could have been in use in Scotland during the twelfth century. Considerable light was thrown on the early castles of Scotland by the Bruce and Wallace, and when built of stone this circumstance was always emphasised so as to distinguish them from castles built of "tre." There were many references to strengths and bridges made of timber. Thus, in the Wallace, "a strength thar was on the watter off Cre, within a rock, rycht stalwart, wrocht off tre." From the detailed description which follows, there could be little doubt but this was a wooden castle, partly surrounded by the river and partly by a ditch. Wallace "brak doune the strenth, bath briggs and bulwark all out over the rock, thai gert the temyr fall." Barbour also tells how Earl Douglas set ingenious wrights to construct a "fayr maner," which successfully resisted a siege. Again, there was Blind Harry's description of the taking of the fortified place of Rannock:—"Thus entryt thai within a little space. The yett thai wan, for castell was thar nayn; but mudwall werk, withoutyn lym or stayne." These and many other examples showed how late in the history of this country castles of this kind prevailed, even after the custom of building stone castles had been introduced. Both kinds of castles were familiar to Barbour and to Henry. The former tells us how Lord Soulis was sent "Till his pennance to Dumbertane, and deit thar in a tour off stane;" and Henry says of Wallace that "Agaynis him in Galloway hous was mayne except Wigtoun, byggyt off lyme and stayne." It was thus evident that it need not be assumed that a reference to a castle in the twelfth century in Scotland meant a stone-built structure—the probability being that it did not—and not perhaps till the thirteenth century did stone castles come to be erected in Scotland, and of the type which succeeded the Norman keeps in England, known as Edwardian castles. These were the castles of our first period, and might be briefly described as strongly fortified camps defended by stout, lofty walls and towers. Castles of this type were built in great numbers throughout the West Highlands and islands, and had been vaguely written about as of Scandinavian origin, but they quite agreed in principle and detail with the Edwardian castles of the mainland and of England, so that they were Scottish castles. Attention was drawn to the extraordinary personal and jealous care shown by Edward I. in everything regarding the castles of Scotland, and that he put his trust of holding Scotland largely in them.

The Inscriptions have been completed on the pedestal of the Boadicea group, set up at the end of Westminster Bridge. On the front has been inscribed, "Boadicea (Boudicca), Queen of the Icenæ, who died A.D. 61, after leading her people against the Roman invader;" whilst on one side is "Regions Cæsar never knew Thy posterity shall sway," and on the other, towards the Embankment, "This statue, by Thomas Thornycroft, was presented to London by his son, Sir John Isaac Thornycroft, C.E., and placed here by the London County Council, A.D. 1902."

ARCHITECTURE AT THE SCOTTISH ACADEMY.

THE architectural drawings and kindred works, says the *Scotsman*, are suitably housed this year in the small octagon, which is now perfectly lighted by the removal of the obscuring glass in the cupola. For the first time in the history of the Royal Scottish Academy the Council permitted the architects to be represented by photographs of their works; and of this concession several have availed themselves. It is not at all unlikely that photography will supersede the elaborate perspective drawing which has hitherto been in vogue at exhibitions of architecture. The most prominent object in the room is a model in plaster, reinforced by coloured drawings on the walls, of the design sent in by Sir Rowand Anderson to the national competition for a memorial to the late Queen Victoria. That it was not accepted was not due to any defect in the design, which is of a truly Imperial character, but simply because something else caught the eye of the adjudicators. The design has a certain grandiose character appropriate to a memorial which was to represent the might of empire in the Victorian era. It is essentially an architectural conception, with which has been happily combined the art of the sculptor. The central feature is a massive pedestal, rising out of the square into the round, with groups on projections at the angles representing the army and navy and the arts of peace. Higher, and clustered round the pedestal, are figures symbolical of those jewels of the British Crown, India, South Africa, Canada and Australia, while on a broad band near the top is a circle of lions in relief, representing the growing colonies. The whole is appropriately crowned with a figure of the late Queen, with her hand on the head of a lion. The memorial is approached by a flight of steps, and is set within a low, circular, balustraded wall, on which historical figures are placed at intervals. The drawings on the walls show how, in connection with the central design, it was proposed to treat the approach to Buckingham Palace. The design, with its fine breadth of conception and its many interesting details, has attracted much notice. Mr. Hippolyte J. Blanc sends the elevation for the property at present being reconstructed at 60 Princes Street, which promises to be a further adornment to this fine thoroughfare. It has a Renaissance front, the decorative effect being secured by the use of mullioned and transomed windows, and by finishing it off with a gable top. Mr. G. Washington Browne contributes a case of photographs showing a group of executed works which have commended themselves not less by their agreeable design than by their adaptability to the purposes for which they were built. These include the Sick Children's Hospital, the Edinburgh Public Library, Redfern, &c. Mr. John Honeyman exhibits a design for a Gothic cathedral, with square tower rising over the intersection of nave, transepts and choir. It is well proportioned, though the details are not all of equal merit. He also shows a drawing of Skipness Castle, Argyllshire, in the Scottish Baronial style, which constitutes a fine group. Mr. John Kinross shows views of dairy buildings at Manderston which suggest the thought that the cattle there must be very elegantly housed. The work is of an academic order. Excellent photographs are shown by Mr. William Flockhart, a London Scotsman, of the mansion-house of Rosehaugh, Avoch. This handsome pile is in the picturesque château style of architecture. The prominent feature of it is a central tower with high-pitched roof, around which is grouped in an effective manner the rest of the building, which shows well-arranged terraces and balconies and quiet spaces between the transomed windows. The building altogether is admirable in its conception and details. The Associate-elect, Mr. R. S. Lorimer, sends a case of photographs of his work. One of these gives a view of a simple, well-proportioned house, with the decoration neatly applied; another is a pleasing view of the interior of the Church of the Good Shepherd, Murrayfield, and the rest of the photographs show artistic treatment of domestic interiors. The Erskine United Free Church, Burntisland, is an agreeable Gothic design by Mr. J. B. Wilson; the Carnegie Library, Coatbridge, is a compact, Classic building by Mr. A. Cullen. One is not very much in love with the elevation of the Bruntsfield Higher Grade school, Warrender Park Crescent, by Mr. J. A. Carfrae, and may hope that it will work out better in stone and lime. The new offices for the Glasgow Parish Council and the competitive design for the Springburn Hall, by Messrs. Thomson & Sandilands, Glasgow, are both ornate Renaissance buildings. Messrs. Dunn & Findlay show sections of the bold and effective architectural and sculptural treatment they are putting upon "The Scotsman" buildings. Messrs. Hamilton, Paterson & Rhind exhibit a picturesque design for a summer residence at Dunbar, with a nice verandah and an effective disposition of the gables. Mr. J. A. Campbell, Glasgow, has an attractive case of photographs of artistically treated interiors of dwelling-rooms, and of the fitting up of a billiard-room, in a luxurious style.

Messrs. Honeyman, Keppie & Mackintosh, Glasgow, show a boldly treated warehouse front; Mr. A. N. Paterson, Glasgow, drawings of houses in a pleasing style of modern Scottish, and photographs of the carriage porch at Auchendennan, Dumbartonshire, which does not strike one as being in so perfect taste as the interiors of the same mansion-house. Messrs. Simon & Crawford sent flat drawings of a house at Peebles, nicely proportioned in its parts, and to which a decorative aspect has been given by mullioned windows, dormers and red-tiled roof. The winning design for the Tite prize of 1901 is exhibited by Mr. Walter Fairbairn. It takes the form of a massive Classic arch with flanking arcade, and is a pleasing study in proportion and grouping. Mr. R. F. Sherar, Edinburgh, exhibits the accepted design for the Queen Victoria Memorial, Allahabad—a bold and striking work, with arched and groined base, campanile tower and crown cap. It is apparently to be executed in grey stone with coloured bands. Messrs. Cooper & Taylor exhibit their pleasing design for the new offices of the Queen's Rifles Volunteer Brigade, Forrest Road. Among work in colour shown is a drawing by Mr. Scott Morton, of St. George's Chapel, Windsor, with the details of the stalls and roof set off by the gay colours of the banners of the knights. There are also coloured designs for the decoration of the banqueting-hall of the Glasgow Municipal Buildings by Mr. W. Leiper, and of pleasing interiors by Mr. Andrew Ednie, Mr. John Ednie and Mr. A. W. Lyons.

ART FRAUDS IN LONDON.

IN a letter to the *Times*, Mr. John MacWhirter, R.A., writes:—The paragraphs in the *Times* of Monday last, headed "Alleged Art Forgeries in Paris," suggested to me that it is time to expose certain art frauds in London and England generally. I will speak of landscapes only. For years I have known that there must exist a sort of manufactory of spurious pictures. I myself have seen dozens; but there are hundreds of copies or imitations of works by Turner, Constable, Corot, Müller, &c., sold as genuine, and many of these in well-known collections in London, Glasgow, &c. Müller (being second-rate) is perhaps not so much mimicked as the greater men. But the Corot and Constable frauds are notorious.

Turner, the greatest of the landscape-painters, is not easily imitated—his subtle qualities, his refinement and exquisitely suggested detail are far beyond the reach of the imitator—nevertheless there are plenty of attempts.

Corot's early works are thorough, highly-finished and precise (as the early works of all artists should be). His later works are always charming, graceful, fluent and full of light. Nevertheless, they can be easily imitated in a flippant way. The copies, of course, have not the light touch and the silvery light. The forgeries of this master are extremely numerous.

Constable, especially in his later works, used the palette knife freely and glazed over broken colour. This sort of thing is easily mimicked by a clever rogue. These things are sometimes very clever, sometimes clumsy; but in all cases the fraud can be detected by a nature lover. The obvious want of knowledge of tree growth and plant life gives them a coarse and ignorant look—a contrast to Constable's masterly way of making clouds move, trees grow and plants live. He was a student of nature all his life (see the beautiful pencil drawings of trees, &c., in South Kensington Museum).

Very likely, in spite of this warning and more that I could add, collectors will continue to buy "deceased masters," real and sham, with closed eyes as long as it is the fashion, and so-called art experts will advise.

I hope a capable figure painter will follow this up.

HISTORICAL CONGRESS AT ROME.

THE *Times* correspondent in Rome, writing on March 28, says:—The principal subjects for discussion at the International Congress of History, which is shortly to be held here, are as follows:—The teaching of history in different countries and in different grades of schools (speakers, M. Fredericq for Belgium, M. Blok for Holland, M. Gertz for Denmark, Herr Bresslau for Germany, MM. Monod and Sagnac for France, Señor Altamira for Spain, Mr. Putnam for the United States, and others). There will also be discussed at session 1 a proposal for an international association for the publication of Greek *papyri* (speaker, G. Vitelli), Latin lexicology (speaker, Ramorino), bibliography of Greek and Latin classics (speakers, E. Stampini and R. Sabbatini); session 2, proposal and agreements for a *Corpus Inscriptionum Italicarum* (speaker, Father Novati), proposal and agreements for a *Corpus Chartarum Italicarum* (speaker, L. Schiaparelli), the institution of a Venetian-Levantine museum (speaker, G. Gerola); session 3, literary, bibliography (speakers, A. D'Ancona and

Fumigalli); session 4, first group, the Bronze Age, the Mycenaean period, Venetian-Illyrian civilisation, the drawings of antiquity, ancient geography of Italy (speakers, Colini, Orvi, G. Ghirardini, R. Lanciani, L. Pigorini); second group, the use of national languages in the inscriptions of coins (speaker, S. Ambrosoli); the arrangement of collections of coins (speaker, S. Ricci); third group, the history of art (speakers, Venturi, Apolloni and others); fourth group, editions of the *Scriptores Musici* (F. Ramorino), museum of dramatic art (L. Rasi), questions concerned with the teaching and the bibliography of musical art (Tabaldini and Villanis); session 5, the new historical methods applicable to the evolution of modified law (Saleilles), the practical organisation of a course of history of law (Altamira), functions and limits of law history in academical teaching (P. del Giudice); session 6, the preparation and publication of an historical atlas of Italy (G. Dalla Vedosa); session 7, *Corpus* of the Byzantine philosophers (L. Stein), the application of present historical ideas to the history of philosophy (G. Barzellotti), the most efficacious means for promoting monographs on the history of the philosophy of the Renaissance (F. Tocco), what were the reasons for the departure of Buddhism from India, and how it was received by populations of a different race, like the Mongolian, exercising such an influence on them as to modify their primitive tendencies (C. Puini), the contribution of Italy to the critical edition of the Mahabharata (P. Pavolini); session 8, the use of Oppolzer's rule of eclipses in verifications of an historical character (E. Millosevich), bibliography of exact sciences (P. Giacosa), in what manner and measure can the history of exact sciences become a subject of university courses (D. Barduzzi, G. Loria and P. Giacosa).

THE ROYAL ACADEMY.

A CORRESPONDENT of the *Glasgow Herald* writes:—A number of statements, purporting to be authoritative, have within the past week or ten days appeared in print to the effect that the Royal Academy has as a body definitely determined to reduce the number of works which non-members can submit for the consideration of the selecting committee. Far and wide the tidings have been accepted as of a *fait accompli*. That a change in this direction is inevitable, if only to reduce somewhat the unnecessarily arduous labours of the Council each spring, that for long it has been contemplated, that recently definite shape has been given to the proposal—these are matters of more or less common knowledge. On the other hand, the projected change, despite all announcements to the contrary, has not as yet taken definite shape. The Council of the Royal Academy consists this year of the two latest elected R.A.'s—this is the invariable custom—Messrs. G. F. Bodley and G. J. Frampton, as well as Sir Laurence Alma-Tadema, Messrs. T. G. Jackson, Val Prinsep, J. W. Waterhouse, Henry Woods, W. F. Yeames, and the Scotsmen, John M'Whirter and W. Q. Orchardson. The foundational truth in the published statements consists in the fact that this Council has passed a resolution to the effect that "outsiders" shall be permitted to send in two works only, instead of eight as heretofore; that members and associates shall be entitled to exhibit six works only, instead of eight. But the resolution does not become operative until it has been further ratified, as will be seen from the following clauses, which form part of the "instrument" of the Royal Academy:—

"All laws and regulations which may from time to time be made by the Council shall be confirmed at a subsequent meeting of the Council before they be presented to a general assembly of the Academy for their consent."

"If at a general assembly of the Academicians five members object to any law or regulation made in the Council for the government of the Society they shall deliver their objections in writing, signed with their respective names, which done, the law or regulation objected to shall be referred to the Council to be reconsidered."

In addition to the assent of the general body of members and associates, moreover, the formal concurrence of the King, accorded by his signature, is necessary.

Between the "thick and thin" upholders of the Royal Academy, on the one hand, the critics who assail it, no matter what it does or what it refrains from doing, on the other, unbiassed observers are somewhat mystified. A few facts in connection with the projected change are not, then, out of place at this moment. The public announcement of the inaugural exhibition of the Royal Academy was issued in March 1769 and dated from the erstwhile auctioneers' chambers in Pall Mall, near Old Carlton House. It ran as follows:—

"The President and Council give notice that their exhibition will open on April 26 next. Those artists who intend to exhibit with the Academicians [not till later were associate members admitted] are desired to send their several works to the Royal Academy, in Pall Mall, on Thursday, April 13, or

before six o'clock in the evening of Friday, the 14th, after which time no performance will be received. N.B.—No copies, nor pictures without frames, will be admitted." Of the 136 works brought together no fewer than 57 were by outsiders. An apology was published anent the charge of 1s. made for admission. It was the desire of those responsible for the conduct of this institution, "supported by royal munificence," to make exhibitions free, but in order that the rooms might not be filled by "improper persons to the entire exclusion" of those for whom the show was intended, the 1s. entrance fee was charged. It remained open for four weeks and four days, and the receipts amounted to 699*l.* 17*s.* 6*d.*, leaving a surplus of 583*l.* 3*s.* 4*d.*, out of which grants amounting to 145*l.* 1*s.* were made to 26 artists unconnected with the institution. This demonstrates that the Royal Academy in the first year of its existence was generous in its acceptance of work by non-members and in the distribution of its profits. At the second exhibition of 1770, of the eleven works omitted for lack of space eight were by Academicians who waived their privileges to make room for others—among their number was Paul Sandby. The receipts amounted to 971*l.* 6*s.*, out of which grants of 173*l.* 5*s.* were made, albeit this left a net deficiency of about 725*l.* defrayed from the privy purse of the royal founder. Perhaps the most noteworthy incident connected with the refusal of a picture—at any rate in the earlier days of the Academy—is that which caused Dr. Johnson on April 12, 1783, to write to his friend, Sir Joshua Reynolds, and to James Barry about Mr. Lowe's "The Deluge." The first-named letter is worth quoting:—

"Sir,—Mr. Lowe considers himself cut off from all credit and all hope by the rejection of his picture from the exhibition. Upon this work he has exhausted all his powers and suspended all his expectations, and certainly to be refused an opportunity of taking the opinion of the public is in itself a very great hardship. It is to be condemned without trial. If you could procure the revocation of this incapacitating edict you would deliver an unhappy man from great affliction. The Council has sometimes reversed its own determinations, and I hope that by your interposition this luckless picture may not yet be omitted. JOHNSTON."

Johnson's advocacy was effective, but the unfavourable judgment of the Council was confirmed by the public when they saw the canvas in an empty room at Somerset House, where, from 1780 to 1867, the annual exhibitions were held.

The table which follows shows the number of works included in the first twelve exhibitions of the Academy, and thereafter in those arranged at the opening of each decade up to the present time, as well as in 1889, when high-water mark as to numbers was reached. In a few cases I specify the nature of the works and the number rejected.

Year.	Pic- tures.	Water- colours and mini- atures.	Archi- tec- tural Draw- ings.	Engrav- ings.	Sculp- tures.	Total.	Omitted.
Pall Mall.							
1769	—	—	—	—	—	136	—
1770	—	—	—	—	—	234	11
1771	—	—	—	—	—	256	20
1772	—	—	—	—	—	310	14
1773	—	—	—	—	—	359	26
1774	—	—	—	—	—	355	9
1775	—	—	—	—	—	390	10
1777	—	—	—	—	—	416	7
1778	—	—	—	—	—	404	25
1779	—	—	—	—	—	395	6
Somerset House.							
1780	—	—	—	—	—	489	—

1800	—	—	—	—	—	1,100	—
1810	—	—	—	—	—	905	—
1820	—	—	—	—	—	1,067	—
1830	—	—	—	—	—	1,278	—
1840	—	—	—	—	—	1,240	—
1850	—	—	—	—	—	1,456	—
1860	—	—	—	—	—	1,096	—
Burlington House.							
1870	—	—	—	—	—	1,229	—
1880	—	—	—	—	—	1,586	—
1889	1,264	412	200	138	182	2,196	—
1890	1,172	400	234	137	176	2,119	—
1895	887	384	201	137	104	1,713	—
1900	1,090	436	233	153	145	2,057	11,405

The great space afforded by the new galleries at Burlington House, opened in 1869, effected a steady increase in the number of contributions. In 1868, for instance, the last year of the exhibitions in Trafalgar Square, 3,011 works were submitted; in 1888 members exhibited 177, and non-members submitted 9,385, of which 7,485 were rejected; and in 1900 the maximum of 13,462 works were examined by the Council in order to produce an exhibition of less than one-sixth of that number.

A final word as to the projected change. I learn on good authority that if the "outsiders' maximum was halved—that

is to say reduced from eight to four—it would result in a diminution of no more than 2,000 submitted works, and that the cutting of this maximum down to two will still leave the selecting committee with about 10,000 works whence to select about 1,500. In other words, artists who, by “sweeping their studios,” submit from three to eight works, contribute a total of but two-sevenths of the aggregate. Reform was bound to come on the lines suggested by Mr. Frith as long ago, if I mistake not, as the eighties; and it seems hardly worth while interfering at all unless the total submitted number be reduced by 4,000 or 5,000. It remains to be seen, of course, whether at a general assembly, where associates interested in many outside friends possess a preponderance of voting power, the scheme will be carried.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the concluding meeting of the session of the Leeds and Yorkshire Architectural Society Mr. Butler Wilson, F.R.I.B.A., was elected president for the third successive year. Following the election of officers, a lecture was delivered by Mr. Robert P. Oglesby, entitled “Sir John Vanbrugh, Dramatist and Architect.” Vanbrugh was charged with introducing indecorous elements into his plays, and the essayist quoted his pamphlet of vindication, in which the dramatist said:—“The business of comedy is to show people what they should do by representing them upon the stage doing what they should not. The stage is a glass for the world to view itself in. People ought, therefore, to see themselves as they are. If it makes their faces too fair they won't know they are dirty, and by consequence will neglect to wash them”—a defence which Mr. Oglesby characterised as witty if not strong. As a comic writer he was “something between English and French, without being over nice or giving too much praise to virtue as a convention,” and it was added that the license of the period was responsible for the plainness of speech which his high spirits did not tend to repress. Of feeling, in the sentimental sense, he possessed little, but his plots were always interesting and free from complexity. Whatever ideas he borrowed from other writers he seemed to change into something better by sheer sleight of hand. Incidentally, the essayist read a dialogue from “The Provoked Wife,” in which he said Vanbrugh forestalled Swift in his philosophy of clothes, and anticipated Carlyle's “Sartor Resartus.”

The line which divided Vanbrugh's work as a playwright and his career as an architect was clear and decided. There was, in a sense, a slight overlapping of vocations, inasmuch as his first completed architectural work was a theatre in the Haymarket. This sudden leap from the drama to architecture was taken as a glorious joke by his brother wits and litterateurs, who forthwith let loose such a flood of sarcasm and raillery upon his architectural efforts as would have crushed with ridicule any ordinary individual. A house that Vanbrugh erected for his own occupation on the site of the ruins of old Whitehall was dubbed by the wits the “Goose-pie.” The first great scheme of this imaginative but unschooled architect was the design and erection of Castle Howard, Yorkshire, for the Earl of Carlisle, in 1702. His want of training was here observable on all hands, but his genius for the picturesque atoned for many defects.

The Earl of Carlisle was so satisfied with the designs for Castle Howard that he created Vanbrugh Herald Clarenceux King at Arms. Walpole declared that the mausoleum there “would almost tempt one to be buried alive.”

In the east wing of the south front of Castle Howard there are, contrary to Classic law, an even number of subdivisions, viz. eight, whereas to the west wing are allotted nine such spaces. This curious fact appears to have escaped the notice of Vanbrugh's numerous and most recent commentators. Mr. Oglesby advanced the theory that Carr, of York (the architect of Harewood House), in completing the west block, added another space, thus correcting Vanbrugh's want of training.

Among other notable buildings designed by Vanbrugh were Clarendon Building, Oxford; Seaton Delaval; King's Weston, near Bristol; Fleurs Castle, Roxburghshire; Kneller Hall, Hounslow; Grimsthorpe, Lincolnshire; and Stowe, Buckinghamshire. Reserved to the last was Vanbrugh's greatest work, Blenheim, erected by a grateful nation for that famous son of Bellona, John Churchill, first Duke of Marlborough, in commemoration of his glorious victories over her enemies.

The plan of Blenheim at once stamped Vanbrugh as a man of powerful imagination, and, concluded the essayist, notwithstanding his glaring want of refinement and taste, he would, had he lived longer and further studied, have become a really great architect. His ponderous extravagances, however blamable in detail, were never contemptible in the whole; but it was this love for the ponderous in architecture that inspired Dr. Evans's witty and not inappropriate epitaph:—

Lie heavy on him, earth! for he
Laid many heavy loads on thee.

All the buildings of this unschooled architect were conceived on such a huge scale that it has been quaintly remarked that their ruins will have far greater effect on the minds of posterity owing to the additional piles which conjecture will supply in order to give meaning to the whole.

A vote of thanks was accorded to the lecturer, on the motion of Mr. G. F. Bowman, seconded by Mr. H. S. Chorley.

GENERAL.

The King has commanded Mr. Emil Fuchs to paint his portrait. Sittings are to be given to the painter in a studio specially arranged at Buckingham Palace.

Her Majesty the Queen has selected two miniatures by Mr. C. P. Sainton, viz. *A Summer's Thought* and *the Spirit of the Marsh*, for purchase.

An International Exhibition of artistic, scientific, industrial, commercial and Colonial productions, &c., is to be held at Liège in 1905. The exhibition will open in the month of April and will last for at least six months.

The Pile-driving around the foundations of the Campanile Venice, is likely to be commenced on the 25th inst., the festival of St. Mark. The King of Italy is expected to be present.

The Society of Architects will hold their annual dinner at the Prince's Restaurant, Piccadilly, W., on Friday, May 15. Mr. Silvanus Trevail, J.P., will take the chair.

A General Meeting of the Surveyors' Institution will be held on the evening of the 20th inst., when amendments and additions to the by-laws will be considered. The next country meeting will be held in Dublin on May 7 and 8, to be followed by excursions.

Mr. A. Wright has been appointed managing consulting electrical engineer to the Marylebone Borough Council, and will receive 4 per cent. on an estimated capital expenditure in erecting a new generating station, &c., of 500,000*l.*, this rate of pay being spread over eight years.

Mr. Deputy Baddeley has offered to place a statue of John Milton in front of the church of St. Giles, Cripplegate, a building which is now visible, as the old shops which stood in front of it have been taken down.

The Partnership existing between Frederick Wheeler, F.R.I.B.A., of 6 Staple Inn, W.C., and Horsham, and Percy Dean Lodge, F.M.S.A., of Horsham, practising in Sussex as Frederick Wheeler & Lodge, architects, Bank Chambers, Carfax, Horsham, was dissolved on March 31. The practice will now be carried on solely by Frederick Wheeler at both the above London and Horsham addresses.

Mr. Bertram Blount announces that owing to the death of his late partner, Mr. W. Harry Stanger, the firm of Stanger & Blount is dissolved. The business of the late firm is being temporarily conducted at 2 Broadway, Westminster, but at an early date Mr. Blount will remove to other premises in Westminster.

“Vox Populi,” the vigorous painting by the late Charles Verlat, president of the Antwerp Academy, is included in the exhibition of the Royal Society of Artists, Birmingham, which opens to-day. It represents the scene in Jerusalem when Barabbas was preferred. A large illustration of it has appeared in *The Architect*.

The Art Gallery Committee of the Manchester Corporation have obtained ground for an extension of the buildings but some of the members consider that in view of the probability of the erection of a more extensive building for the purpose on the site of the infirmary, it will be prudent to delay the contemplated extensions.

An Ancient Aqueduct at Palma Nova, which was regarded as one of the Italian monuments, collapsed on Tuesday last.

Papers will be read at the Society of Arts' Wednesday evening meetings after Easter as follows. April 22.—“Modern Bee-Keeping,” by Walter Francis Reid, F.C.S. April 29.—“Automatic Waggon Couplings,” by T. A. Brockelbank. May 6.—“The Construction of Maps and Charts,” by G. T. Morrison. May 13.—“Preservation of Big Game in Africa,” by E. North Buxton. May 20.—“Fencing as an Art and an Historic Sport,” by Egerton Castle, M.A.

Sir William Emerson has presented his report on the seventeen designs for the baths, tramway offices, &c., to be erected on a part of the site of the old St. George's Dock, Liverpool. The first place is awarded to the joint design of Messrs. Stones & Stones, Blackburn, and Mr. W. E. Sproat, Glasgow; the design by Messrs. Briggs & Wolstenholme, Liverpool, is placed second; and the design by Mr. Huon A. Matear, Liverpool, and Messrs. Simon & Crawford, Liverpool and Manchester, third. The report states that all the designs would require modifications.

THE

Architect and Contract Reporter.

NOTICE.

Next Friday being Good Friday, THE ARCHITECT will be published on Thursday. All Advertisements intended for this Number must reach the Office not later than 4 P.M. on Wednesday, April 8.

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding £15,000. Premiums of 60%, 25% and 15% will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60% and 30% are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed £14,000. Premiums of 75%, 50% and 25% respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

THE BERKEFELD FILTER.

WHEN the filtering of water was first attempted the arrangements adopted were of a most primitive kind. It used to be stated in books on sanitation that a most effectual filter could be made by any one who would put some sand and gravel in a common flower-pot. We may now smile at so rude an apparatus, but it corresponded with the state of knowledge relating to water. Nothing was known about bacteria, and the analysis for dangerous constituents was very simple. The progress of science has convinced people that the solid impurities, the salts and mineral ingredients found in water, are not the greatest evils. The organic impurities, the disease germs, are most to be feared, and to remove them requires something more than served for filtering a few years ago. The Berkefeld patent filter is essentially a scientific one, and corresponds with the latest knowledge on the subject of bacilli. Dr. Sims Woodhead, the director of the Research Laboratories of the Royal College of Physicians and Surgeons, aided by Dr. Cartwright Wood, after several experiments, observed "that the test organisms are completely arrested, so that we must conclude that the Berkefeld filters may afford an efficient safeguard against the passage of disease germs." In a second report representing further experiments during three years the same experts said:—"We must accordingly conclude from the extensive series of experiments carried out with these Berkefeld filters that they afford complete protection against the communication of water-borne disease." The filters are produced in forms to meet all requirements, including those supplied to troops in the field and to explorers. There are glass-ware filters, stone-ware filters, house filters of various kinds, laboratory and experi-

mental filters, filters for surgical operations, restaurant filters, and filters on a large scale for the water supply of villages or towns. The Berkefeld Filter Company, Ltd., have laid themselves out to meet all cases in which pure and germ-free water is desired, and the works may be looked on as a scientific establishment in which water not only becomes "the liquid crystal" described by the old poets, but a fluid from which all dangers are rigorously eliminated.

THE ASSOUAN DAM.

THE King has been pleased to give and grant unto Sir John Aird, Bart., His Majesty's royal license and authority that he may accept and wear the Grand Cordon of the Imperial Ottoman order of the Medjidieh, conferred upon him by His Highness the Khedive of Egypt, authorised by His Imperial Majesty the Sultan of Turkey, in recognition of his valuable services in connection with the recently completed Nile reservoirs.

The King has been pleased to give and grant unto Maurice Fitzmaurice, Esq., lately superintending engineer of the works on the Assouan Dam, in the service of the Egyptian Public Works Department, His Majesty's royal license and authority that he may accept and wear the Insignia of the Second Class of the Imperial Ottoman Order of the Medjidieh, conferred upon him by His Highness the Khedive of Egypt, authorised by His Imperial Majesty the Sultan of Turkey, in recognition of valuable services rendered to the Egyptian Government.

AMERICAN COMPETITION IN THE IRON TRADE.

THE conference on American industrial conditions and competition, organised by the British Iron Trade Association, was held on Tuesday at the Westminster Palace Hotel.

Mr. E. Parkes, M.P., presided, and moved a resolution welcoming the announcement of the Government that it was about to institute an inquiry into the constitution and functions of the Board of Trade and expressing the belief that such an inquiry could hardly fail to be serviceable to the interests of British trade and commerce. There had been a feeling that the Government had been rather supine upon commercial questions and that they needed waking up on that important subject. What the trading people felt was wanted was more

THOMAS LAWRENCE & SONS, BRACKNELL, BERKS.

acting in concert, more promptness and perhaps more alertness in discussing and settling the questions of trade which came before the Government departments from time to time. He believed the Government realised to some extent the state of confusion in which trading questions were at the present time in the different departments, and felt the necessity for some new action. In the first place, the co-operation of the great trading organisations of this country with members of the House of Commons was necessary in order to give effect to the feelings and opinions of the trading community of the country; and, until they had some organisation for making their wishes felt in the Government departments, they would have very little chance of being listened to. He hoped the result of the promised inquiry would be that men who understood the real requirements of the trading community would be appointed as consuls. Trade was not in a very flourishing position at the present time. At any rate, the experiences of most manufacturers in the iron and steel trade were not very encouraging. The condition of trade in this country was, generally speaking, one of long depression with occasional "booms." People of late years had been looking round for the cause, and some attributed it to lack of education. Education had not saved Germany from bad trade and low profits, but they must all recognise the enormous strides which Germany had made in the last few years in equipping herself for the trade of the world. With regard to America, he had been struck by the fact that many of the positions of responsibility in that country were filled by Englishmen who had gone out many years ago for the purpose of improving their position. And he thought they could say with confidence that the best American workman was not better than the best English workman. No better workman existed anywhere than the steady, self-respecting English workman. But he was prevented from taking full advantage of his opportunities by reason of the restrictions which were imposed upon him. Americans were past-masters in labour-saving appliances. Englishmen, though they realised the value of these appliances, were unable to adopt them to any great extent owing to want of capital. Given equal opportunities and capital, he believed the English could produce anything equal to the Americans. This idea of the necessity of new machinery had laid hold of the people of this country during the last few years, and many splendid installations had taken place and were at the present time taking place in England and Scotland. The question of economy of production was one to which they would have to

turn their attention in the future, even more than that of protective tariffs. The principle of dumping down the surplus manufactures of other countries in this country, which had an open door, and which it was said could not retaliate, was extending, and it was not to be wondered at that the English manufacturers complained of the industrial conditions. It was almost impossible for them to compete successfully with other countries in the present state of affairs.

Mr. Clarence Bird seconded the motion.

Papers were afterwards read by members of the British Iron Trade Association Commission which visited some of the industrial centres of the United States in October 1901, and presented a long report on the American industrial conditions.

NEW CATALOGUES.

A VERY useful book of sections is now being issued by the Glengarnock Iron and Steel Company, of Glengarnock, Ayrshire, whose agents in London are Messrs. Rogers, Twentyman & Co, Leadenhall Buildings, Leadenhall Street, E.C. In this book is clearly set forth a considerable amount of information such as is required by structural engineers, architects and builders engaged in designing structural work and buildings. It gives a number of the different rolled steel sections manufactured by this firm, and also a large variety of sections compounded into girders and stanchions. The sections shown are those in general use, and will aid the designer in determining the form and combination of sections which will be the most economical or convenient for his particular purpose. A number of tables of loads and strains also find a place, as well as a report of tests by experts.

WE have received the new catalogue which Messrs. Oates & Green, Ltd., of Halifax, are just issuing of their sanitary specialties. It is divided into six sections, carefully printed on art paper and illustrated by good, clear blocks.

Section I. illustrates urinals, floor tiles, &c., all of which are manufactured in a highly glazed, heavy fireclay. The prices are all plainly marked, which is an advantage to architects and builders. The "Wyvern," one of Messrs. Oates & Green's latest patents, is a particularly good design, and offers a great advantage in its sloping back, which in consequence insures a thorough cleansing at each discharge of the cistern. It is made of highly glazed, heavy fireclay, with back, sole, channel and pier all in

one piece, an important point in connection with its construction which will be readily understood.

Section II. is devoted to pedestal closets and hospital specialties. The hospital bed-pan sink, illustrated on page 31, is worth attention, and it is easily cleaned; the underside of trap is kept well above the floor-level, enabling easy access for cleaning purposes.

Section III. is devoted mainly to lavatory fittings. Attention may be drawn to the "Skolla" lavatory, which is very reasonable in price, but at the same time fully efficient.

Section IV.—This section contains particulars of trough closets and latrines. The "Isolt" latrine is the latest introduction in this department, and is specially designed for schools and institutions where it is necessary to have absolute isolation. The latrines are complete in themselves, and absolutely cut off from each other by the trap, which is formed with the latrine in one piece of fireclay. For still further protection a trap is also placed at the end of the drain, thus insuring a perfectly isolated sanitary latrine.

Section V. is devoted to baths, washtubs, sinks, &c., all of which are manufactured in the best fireclay.

Section VI. contains many examples of gullies, pipes, channel syphons, grease-traps, &c., all manufactured by the firm at their works at Halifax.

Messrs. Oates & Green, Ltd., are also manufacturers of enamelled and salt-glazed bricks; drawings and prices of these are fully illustrated and described in their catalogue. Space will not permit of our referring at any length to the salt-glazed ware which Messrs. Oates & Green are introducing for stables, but it is obvious how valuable from a sanitary point of view these fireclay mangers, troughs, &c., must be. Where care is paid in connection with the sanitary arrangements of the stable the owner is well repaid, and has made in every way a good investment.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied to the isolation hospital, Southall, Middlesex, their patent Manchester stoves with descending smoke flues.

ON Saturday last, the 28th ult, the inhabitants of Haxby celebrated the opening of a new clock and bell, erected at the schools to commemorate H.M. the King and Queen's Coronation. They were supplied by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds and Newcastle.

MESSRS. AUSTIN & Co., engineers and founders and patentees and manufacturers of haulage, lifting, hoisting and elevating machinery, of Newcastle Elevator Works, Newcastle-on-Tyne, announce that, owing to the rapid extension of their business, they have had to remove into larger and more convenient works. These new works, in which they are now fully installed, are equipped in a thoroughly up-to-date manner, to enable them to deal with the best and largest class of work. Various specimens of the goods they turn out are illustrated in the attractively got up catalogue which Messrs Austin are now issuing, wherein their various forms of passenger and goods lifts, hydraulic cranes, &c., are depicted and fully described. We may mention that Messrs. Austin have branches in London, Birmingham, Glasgow, Melbourne, Liverpool, Manchester, Edinburgh and Capetown.

THE report for the year ended October 31 of Wm. Griffiths & Co., Ltd., shows that, after providing for expenses and wages at the branches and works, a gross profit of 51,583 $\frac{1}{2}$ was earned, as against 40,499 $\frac{1}{2}$ in the previous year. After deducting trade expenses, salaries and other expenses, maintaining the plant, machinery, tools, &c, there is a balance of 29,651 $\frac{1}{2}$, as against 22,270 $\frac{1}{2}$. Including the balance brought forward, there is a total disposable profit of 33,225 $\frac{1}{2}$, out of which an interim dividend at the rate of 10 per cent. per annum on the ordinary shares for the half-year to April 30 has been paid. The directors recommend a further dividend on the ordinary shares at the rate of 10 per cent. per annum for the half-year to October 31, making 10 per cent. for the year, leaving 16,906 $\frac{1}{2}$ to be carried forward.

THE wards and rooms throughout the buildings of the West Ham new infirmary are heated by D. O. Boyd's patent warm air ventilating stoves and grates. The stoves are fixed in the centre of the wards, fresh air from outside being drawn in through ducts in the floors, and warmed by circulating round the back of the fires. It then finds its way through gratings into the ward, and the volume may be regulated according to the temperature required. The smoke from the fires is also conducted under the floors to the chimney. Thus the system gives all the advantages of open fires, which are always so cheerful in a sick room; and in addition to the radiated heat of fires, there is a continuous flow of pure warm air which finds its way into every corner of the room and displaces the foul air through ventilators provided for the purpose. The stoves are cased with large marble slabs on top and sides. This gives a very handsome appearance to them and offers the least

possible facility for the lodgment of dust. The grates in the smaller rooms are built into the walls as usual, but have the warm air circulation just like the stoves. They have been made and fitted throughout the buildings by Messrs. Hendry & Pattison, Ltd., heating and ventilating engineers, 11 Hills Place, Oxford Street, W., and the same firm have carried out all the ventilation as well, using their patent double-action ventilators which exhaust from the wards through specially constructed air flues.

BUILDING AND BUILDERS.

WORK has now been commenced on the new Calvinistic Methodist chapel in Garth Road, Bangor.

THE competition recently held for the Baptist church, Beverley Road, Hull, has been decided in favour of designs submitted by Messrs G. & R. P. Baines, architects, 5 Clement's Inn, Strand, London, W.C.

THE house-painters of Preston struck work on Wednesday in consequence of the masters refusing to advance wages from 8d. to 9d. per hour. During last year, when trade was good, the masters conceded an extra halfpenny, but subsequently served notice upon the men intimating that they would revert to the old rate at the end of six months. This reduction the men accepted, but on the expiration of the term served notices on the masters for an increase of one penny, making the rate 9d. per hour. The masters declare their utter inability to pay the advance, having regard to the present state of trade.

A LECTURE was delivered on the 25th ult. in the rooms of the Building Trades Exchange, Limited, George Street, Edinburgh, by Mr. John Ritchie, whose subject was "An Apparatus for Determining Strains on Cranes and other Structures." There was a large attendance of those interested in the building trade, and the chair was taken by Sir Thomas D. Gibson-Carmichael. In the course of his address the lecturer, by the aid of diagrams, showed how strains on cranes and roofs were calculated. He produced a specially constructed model of a crane, which, by an arrangement of springs, acted both under compression and extension, and the strains on every part of the structure, due to a given load, were registered by a graduated index. This enabled the person employed at a crane to know the effect produced by various weights. The subsequent portion of the lecture was devoted to the nature of strains caused in slinging certain materials.

VARIETIES.

THE belfry of the fine old cathedral at Chartres has been found in a condition which leaves no time to be lost before taking measures for its preservation. By the winds of centuries and the vibration of the bells the masonry had become dangerously insecure. Repairs are to be promptly set on foot.

THE new schools provided for the Ashbourne Road Wesleyan chapel, Derby, were formally opened on the 25th ult. The cost will be about 4,500l.; the architect is Mr. Antliff of Draycott, and the builder Mr. Henry Vernon, of Derby.

THE municipal buildings at Dumbarton, N.B., were formally opened on Saturday last. The buildings, which are in the Scottish Baronial style, are constructed of red sandstone, and form an imposing pile. They front College Park, and there is also a fine elevation to Church Street. The council chamber is spacious; the various municipal departments are handsomely housed, and accommodation is also provided for the police establishment. The architects are Messrs. Baird & Thomson, Glasgow, and the cost of erection was about 19,000l. The buildings occupy a central position on the site formerly known as College Park, which was purchased by Lord Over-toun at a cost of 4,500l. and presented to the burgh. In addition his Lordship had the spacious grounds which surround the buildings fenced and laid off at a cost of 3,600l. The portion of the grounds at the front elevation is very artistically arranged, and the effect is heightened by the Denny statue, which stands in front of the main entrance to the buildings.

THE Runcorn cottage hospital was opened on Saturday. The hospital has been constructed after the style of the old Cheshire buildings, and is prettily situated at Higher Runcorn. It stands on a portion of 2½ acres of land, and faces the south. On the ground floor there are three wards with accommodation for ten beds. The hall, with the addition of a window, becomes a day-room for convalescent patients, and there is also a small operating-room lighted from the top and sides. On the first floor, which is reached by a staircase from the hall, is situated the matron's-room, and there is also a kitchen, pantry, bath-room, &c. On the top floor there are two bedrooms. The building and laying-out of the grounds has cost about 1,500l. and the land 600l. It is estimated that the furnishing will cost about 300l., making 2,400l. Mr. Wilding, surveyor to the District Council, has personally conducted the operations as hon. architect.

BRIGHTON MASTER BUILDERS.

Tuesday the members of the Brighton Master Builders' Association and visitors held the tenth annual dinner. The Chairman, Alderman W. Botting, J.P., presided.

Mr. H. F. Gates proposed "The Corporations of Brighton and Hove." The position of Brighton and Hove might be compared to the occupants of two semi-detached dwellings who recently been fighting about the common drain, and when the dispute was finally settled perhaps they would agree to make internal communication, join hands and "run the show on one establishment."

The Mayor of Brighton said he was sure he was only doing the wish of every member of the Brighton Corporation when he said they were anxious to join hands with Hove. The Mayor pointed to the waterworks, electric lighting and tramway as undertakings the municipality should be proud of possessing, and expressed the opinion that the Corporation enjoyed the support and confidence of the vast majority of the ratepayers. The rates had not increased in a greater ratio than those of other towns of similar size. The Corporation were very good customers to the builders, although perhaps they had occasionally entered into competition with them. When they did build their own houses they had to comply strictly with the by-laws, which were sometimes waived in other cases.

Mr. J. K. Nye proposed "The Association of Master Builders." He took quite a parental interest in it, having been present at its birth and assisted at its christening and confirmation, and also at the formation of their insurance company. Ever since its inception the Association had been a success and had been in smooth waters, and apparently there were no dangers ahead. Their motto was "Defence, not offence," and it was gratifying to know that they were at peace with all their workmen, and that they recognised their services and were willing to pay them a good wage for a good week's work. So successful, indeed, was the Association, and they had so much money, that they had reduced the subscription to one-half of its former extent.

The Chairman, in responding, said that when the Association was called into existence ten years ago, they had great trouble in the town. The men all struck, and were determined to get the masters at defiance and to decide everything in their own shops. That would have been such a serious thing that the masters resolved to fight it out. It took eighteen weeks,

and was a very serious matter for them, but having fought it out very successfully they had had peace ever since, and he thought that both workmen and masters had been very much happier. Brighton could say what no other town of its size could, and that was that they had no rules in their workshops; the master was master, and he decided what should be and should not be. He believed they would have peace for a long while to come. In every way their Association had met with great success. They had plenty of funds, and during the last two years had been able to reduce their subscriptions 50 per cent. At the same time they intended to do the best they could for their men, pay them a good wage, and make their lives as happy as they possibly could, and in return they expected them to serve them well. The insurance company which they started in connection with the Association had flourished so much that at this moment if it was stopped they could give everyone 27s. or 28s. for every 4s. share. They had between 5,000l. and 6,000l. to meet any claim that might be made against them. In both their Associations they had been guided by Mr. J. K. Nye, who had given them very good advice.

LAMBETH BRIDGE.

THE bridges committee of the London County Council have prepared a report which states that they were desirous of bringing before the Council the question of the reconstruction of Lambeth Bridge, in respect of which they were of opinion that powers should be obtained in the next session of Parliament. The present bridge was a stiffened suspension structure, the principle of construction being a combination of iron cables with lattice girders. The bridge was erected about the year 1861, and was freed from toll in 1879 at a cost of 36,000l. Although about 3,000l. had been spent in strengthening the structure, the bridge was still of inadequate strength and had to be used under restrictive conditions, and, having regard also to the increasing traffic, the building of a broader and more substantial bridge was imperative. Bearing in mind the resolution passed by the Council that the new Vauxhall Bridge should be built of masonry, the kind of bridge to be erected in place of the present construction had necessarily been engaging their attention. The question of the gradients practically decided whether it was to be constructed of steel or

masonry. At present the gradients were very steep, being 1 in 19 and 1 in 22 on the north, and 1 in 20 and 1 in 23 on the south. Under an agreement the Council could not raise the level of the centre of the road at the junction of the bridge approach with Lambeth Road and the Albert Embankment more than 3 feet 10 inches above the present level, and as a result that height fixed the level of the beginning of the road over the bridge. Their attention had been drawn to the fact that, even if the restrictions placed upon the Council with regard to Vauxhall Bridge were considerably relaxed in the case of Lambeth Bridge, a masonry structure could not be built with a better gradient than 1 in 25, which was about the same as the northern approach to Southwark Bridge, which, on account of its steepness, was so little utilised for vehicular traffic going southwards. On the other hand, a steel bridge with a gradient of 1 in 30 could be obtained and better facilities for navigation afforded during construction than at Vauxhall Bridge. As it was most desirable that a satisfactory understanding should be come to between the Council and the Thames Conservancy before Parliamentary powers were sought, they had submitted to that body a drawing showing generally the possible headways and waterways, both temporary and permanent, which could be provided under a granite or masonry bridge having a road gradient not steeper than 1 in 25. As the result of a conference between the Thames Conservancy and representatives of the river traffic interest certain conditions had been imposed, one of which was "that the headway of the openings of the temporary works in the two side arches adjacent to the centre arch should not be less than 15 feet above Trinity high-water mark." This, the engineer informed them, was incompatible with the construction of a granite or masonry bridge with reasonable gradients. In the circumstances it appeared to them that there was no alternative but to erect a steel bridge, and they had accordingly submitted to the Thames Conservancy an alternative sketch which they had reason to hope would prove acceptable, and upon which they would be in a position to report at an early date.

NORWICH MASTER BUILDERS' ANNUAL DINNER.

THE fourth annual dinner of the Norwich and District Master Builders' Association took place on the 23rd ult. at the Maids' Head hotel, Norwich, Mr. James S. Smith presiding.

Mr. J. Youngs submitted "The Imperial Forces," and the Mayor responded. In the course of his speech he said there was a little dream or ideal of his, and this was, Why should Norfolk not become a station for an Army Corps or a military centre? As far as he could see they were going downhill that respect. There was talk of doing away with Norwich a military centre, but he thought it would be a great pity if the citizens even allowed the city to develop into a dépôt for a regiment. He thought they should say it should become the headquarters of an Army Corps. There would, however, be the question of the additional rates, but upon this there would probably be a very keen consideration when the War Office were communicated with.

The Chairman proposed "The Mayor, Sheriff and Corporation of Norwich," in the course of which he congratulated the Corporation on the acquisition of the electric-light works, believing it would result in a remunerative undertaking. In regard to the housing question, he hoped that whatever the Corporation did in that matter would be suitable to the class requiring the buildings. Let them not build flats.

The Mayor, in reply, said:—I think myself peculiarly fortunate in being permitted to dine with the Builders' Association of Norwich, as they are a unique body, and one, I am told, who are the largest employers of labour in the city. You ought to be proud of your city, as you are the people who have helped to rear, at any rate, some portion of it, but surely you must feel it a duty in some sort to justify that pride that is to say, to give yourselves a right to be proud of. Before, however, you boast of your city, or rather, the part which you have assisted to erect, before even you venture to call it yours, ought you not to scrupulously weigh the exact share you had in adding to it or adorning it, to calculate seriously the influence upon its aspect which the work of your own hands has exercised? Mind you, I do not say this even when you regard your city in this scrupulous and testing spirit you have not considerable ground for exultation. But please remember that it is chiefly by private, not public effort that your city must be adorned. It does not matter how many beautiful public buildings you possess, if they are not supported by, and in harmony with, the private houses of the town. It is in your private houses that the real majesty of Norwich should consist, and, what is more, it must be by your own personal interest that the style of the architecture which arises around you must be principally guided. Do not think that you can have good architecture merely by paying for

not by subscribing liberally for a large building once in years that you can call up architects and inspiration. You will answer, you cannot feel interested in architecture, you do not care about it. About such architecture as is built to-day no mortal ever did or would care. You do not feel interested in hearing the same thing over and over again. You, then, should you feel interested in seeing the thing over and over again, were the thing even best and most beautiful in the world. Well, but what are we to do? You will say to me, We cannot make architects ourselves. Pardon me, you can; and you ought. Architecture is an art for all men to learn, because all are concerned with it; and there is no excuse for not being acquainted with its primary rules any more than for ignorance of grammar or of spelling. The first thing to be required of a building is that it shall answer its purposes completely, and at the smallest expense. If it is a house it should be just of the size convenient to its owner, containing just the kind and number of rooms that he wants, with just the number of windows he wants put in the places he wants. If it is a church it should be just large enough for its congregation, and of such a shape and disposition as shall make them comfortable in it, and let them hear well in it. If it is a public office it should be so disposed as is most convenient for the clerks in their daily avocations, and so on, all being utterly irrespective of external appearances or æsthetic considerations of any kind, and all being done simply, securely, and at the smallest necessary cost. The fulfilment of any of these first requirements to external appearance is absurd. Rooms must not be darkened by naked ranges of windows symmetrical. Useless wings must not be added on one side to balance useful wings on the other. But observe in doing all this there is no fine art, as it is commonly called, fine art required at all. There may be much science, together with the lower form of art or "handicraft," but there is no fine art. But when the church or other building is thus far designed, then comes the divine part of the work, namely, to turn these dead things into living ones. And that is to be done by ornamentation. Ornamentation is, therefore, the principal part of architecture. If only one could follow these precepts in all modern houses what a unique city would old Norwich be, you can anyhow in the future endeavour, as far as possible, always to follow in the same groove, but try when conducting your building operations to instil a little ornamentation

into your buildings, no matter how humble their destiny, and you will at any rate have the satisfaction of knowing that your work will be admired by future generations. I have now only to thank you, gentlemen, for the patience you have shown in listening to my presumptuous remarks, which have only emanated from my desire to see the city we all love so well keep the characteristics it has always borne of a beautiful and quaint old city.

The Sheriff also replied.

Mr. G. E. Hawes proposed the health of the "Architects and Surveyors" in felicitous terms, and it was responded to by Mr. E. T. Boardman, F.R.I.B.A., and Mr. A. C. Havers; and the remaining toasts were those of "The Merchants of Norwich," proposed by Mr. W. Stacey Daws, acknowledged by Messrs. Porter, C. Cunnell and E. Jewson; "The Norwich and District Master Builders' Association," proposed by Mr. E. Reeve and responded to by the Chairman; and that of "The Visitors," given by Mr. B. E. Scarles and replied to by Messrs. W. Gunton and A. R. Bannister.

The harmony of the evening was contributed to by Dr. Lowe, Mr. H. D. Abbott, Mr. E. Holmes, Mr. H. Haylett, Mr. T. A. King, Mr. H. Hawes, &c.

HOUSING IN GLASGOW.

EVIDENCE was given before the Glasgow Municipal Commission on the Housing of the Poor by Mr. John Paterson, builder, which is reported in the *Glasgow Herald*. He said that he had been in business in Glasgow for over forty years. Previously he had worked as a tradesman, so that his experience extended over fifty years. He was a house-builder, brickmaker, contractor and quarrier. When he started business the wages of skilled tradesmen were from 25s. to 27s. per week. The wages of the men employed by his firm were as follows:—Bricklayers, 42s. 6d. per week of 51 hours; masons and hewers, 40s. 4½d. per week of 51 hours; builders, 10d. per hour, or 42s. 6d. per week of 51 hours; joiners, 10d. per hour, or 42s. 6d. per week of 51 hours; cartwrights, 8d. per hour, or 37s. 4d. per week of 56 hours; blacksmiths, 7½d. per hour; labourers, 5½d. per hour, or 23s. 4½d. per week of 51 hours; navvies, 24s. 4d. per week of 56 hours; cranemen, 32s. 6d. per week; fitters, 4cs.; watchmen, 20s. to 21s. per week. These were the wages agreed upon by the Masters' Association and the men, and were

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

It stops the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this, and for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay, moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Equalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO.

applicable to all building trades. In the brickworks men made 27s to 30s. a week. Women made 15s. to 16s. a week; girls, 15s.; boys from sixteen to twenty years of age 18s. a week. The work done by the women was not heavy work. Some of the women employed were married women. It sometimes happened that a man and his wife and family worked in the field together. They carried on a section of the work in winter, mostly stovework. Women, girls and boys worked during the winter, but their earnings were sometimes smaller on account of the shorter day. They very seldom stopped the stovework in winter time. The lowest wage paid in the list quoted by him was 21s. per week, which was the wage of a watchman.

Do you know of any able-bodied men in Glasgow receiving wages at the rate of 18s. a week or under?—I know of no such men, nor do I know of any reason for such men to work for such a small wage. In fact, we have rather a scarcity of men in the North Side. Continuing, witness said that recently his firm sent for some of the unemployed men who sought Corporation relief work. These men were not as good workmen as their own navvies, but he had no doubt they would become as good with practice. So far as he knew there was always plenty of work.

He thought there was an improvement in the circumstances of workmen to-day as compared with forty years ago. He thought men were more temperate now, their work was lighter, their hours were shorter, and their wages were better, and they took advantage of these conditions and lived better. He knew of men earning large wages who lived in the slums, and he recalled a visit he paid to like localities about forty years ago when he was in search of a squad, and on that occasion his experience was somewhat similar to that of the Commissioners who recently visited the slums. The rents of labouring men had risen about 1s. a week and their wages had risen 1s. a day. In the case of skilled men, who occupied better houses, rents had risen 1s 6d a week and wages 1s. 6d a day. He did not know that it was more expensive for working men to live than it was forty years ago. Groceries were not dearer.

He remembered the city improvement displacements.

Do you think, if the Corporation were to remove the slum areas which remain, that private enterprise could meet any reasonable demand for houses?—I think it would if the ground could be got at reasonable rates. Let the Corporation buy the ground, and sell it at reasonable rates to builders.

What would you call reasonable rates?—For the erection

of rooms and kitchens, not more than 10s. a yard. In a front street you might get a little more.

Would you make provision for the Corporation acquiring the land and making up the deficiency instead of building themselves?—I would suggest that course with the view of improving the condition of the working classes. The suburbs are not convenient.

If the Corporation bought as cheaply as they could, and removed the whole of the buildings, would they not arrive at the market price if they sold in the Faculty Hall?—They should sell at the market price which the ground would bring, with restrictions put upon it as to the character of the buildings to be erected.

If the ground were so restricted there might be a difference between the real value and what the Corporation would get for the ground hampered by conditions?—There might be a difference, and it should be made up by the ratepayers.

If the ground were restricted to small houses do you think it would be practicable to restrict the builder or the proprietor to a particular rent?—I think that would regulate itself because there would be more than one builder.

It was a difficult problem to know what to do with the class of people who polluted their houses, but he thought increased power should be got by the sanitary authorities. Sober men were more uniformly sober now than they were 40 years ago, and the drinkers were more utterly drunken. Tenants should be forced to keep their houses clean. On one occasion he had a property in Polmadie. His factor told him that one of the tenants was likely to pollute the whole building. He knew the husband was a decent man, and he got the sanitary inspector to visit the house. The woman was greatly put about and threatened him with an action, but the remonstrance had the desired effect.

Do you think the Corporation should try that policy?—I would not like to make any suggestion; but I think something should be done. They should endeavour to get the law on their side. Continuing, witness said that a great deal of building was going on in the suburbs just now—particularly in Partick and Govan.

The wages in the brickmaking trades were taken from his own pay-sheets. Before the women workers became what they called good hands, they required to be a season at the business.

As a builder he considered that the work done by building operatives to-day was better than it was forty years ago. He did not think they got as much work done, but there was an

provement in the quality of the work. He was not aware that a large number of masons were idle during the winter. He did not think the Corporation should supply houses for the working classes. Water and gas were different things. He did not think municipal credit should be used for any purpose but would bring the Corporation into competition with private builders. He did not know how the Corporation could discriminate between the deserving poor with limited incomes and others not so decent. He objected to the Corporation building houses for the working classes. There was no scarcity of houses for any section of the community in Glasgow.

Of course you know that the Corporation have held their hands for some time in the closing-up of insanitary houses, and that there is a probability that they will resume activity and close a great many within the next few years.—They are bound to do so, for it is desirable and necessary that overcrowding and insanitary conditions should be ended. Who will supply the cheap houses as a substitution for those so closed? The supply will always meet the demand; at least, it has been my experience for the last forty years.

He knew there were a great many back lands in Glasgow. He would clear them all away, and if the front land was a substantial building he would gut it out and redivide it. He would take stringent measures with the undesirables. If they would not get them dislodged from their old haunts he would acquire ground in the country, to which he would take them and make them work.

You say that builders have been busy for the past five years, that they have not been paralysed by the proposals of the Corporation?—They have been building a different class of house. Rents of room and kitchen houses had increased within the last ten years, but builders had been putting in galleries and kitchen ranges, and these extras increased the rent. There might be a class of people who had a wage of 18s. a week. He could give no information about the class.

The Chairman: In regard to this scheme of yours for the Corporation purchasing ground, condemning unworthy houses, and selling it for what it would bring, for the purpose of erecting workmen's houses, and debiting the difference to the ratepayers—is that not making the ratepayers pay for giving comfortable houses to these people?—Not necessarily.

If this ground is worth 5/., and the Corporation only get 3/., the ratepayers have to pay the 2/., i.e. of difference. Is that not just the ratepayers giving cheap houses to these people?—I agree.

I thought you objected to the ratepayers paying in another way?—Yes; they should leave it to the builders.

What is the difference between the two?—I think there is a great difference. I would not make the municipality builders. I do not think the municipality can build as cheaply as builders.

Would you be surprised to learn that about 1888 the rate under the Improvement Act of 1866 was 2d. per 1/., on the rental of the city, and that since the Corporation began to build there has been no rate at all?—But you have not provided for the class you displaced.

You are anxious that the authorities should deal with dirty tenants. What solution have the landlords for dealing with this class?—The landlords would willingly co-operate with the authorities in removing all nuisances.

INDUSTRIAL PARTNERSHIP.

ON Monday at a special meeting of the Council of the Charity Organisation Society, Sir George Livesey read a paper on "Industrial Partnership and the Prevention of Distress." He said that the question as to how industrial partnership was to prevent distress was difficult to answer. Industrial partnership was more than simple profit-sharing, which was but the first step in that direction. In its complete and ultimate form, as he understood it, it was a real partnership—beyond mere salaries and wages—of capital and labour, of employer and employed in the business in which both were engaged; it was a partnership in capital and therefore in the profits on capital, in responsibility and in actual management. He thought that when this became general the whole class of workmen would have been lifted to a higher plane, and they would be owners of property and would be thus removed from the risk of distress due to temporary depressions of trade. But this was a dream, and any man who thought it might come true would be regarded as a dreamer. The first step was to dissipate that pessimistic opinion. When the Gas Workers' Union was master in the retort houses of the South Metropolitan Gas Company in the autumn of 1889 he thought that possibly at some future time they might be again free. Within three months that was realised, but it never occurred to him as possible that in a dozen years or so nearly every man would be a shareholder in the company, that some 4,000 men would possess in the ordinary stock or on deposit with the company 170,000l., or over 40l.

per man on the average; that numbers of working-men who said that they could never previously save a penny were possessors of 100*l.* or more, a good few having become owners of their houses; that three employes—two workmen and one clerk, elected by their shareholding comrades—would be sitting on the board and taking part as directors with credit to themselves and with advantage to the company; that since 1889 a dispute or a difficulty or a difference of any kind between the workmen and the company had been unknown, and that such a spirit of co-operative goodwill should prevail on the part of the men generally as entirely to relieve all who had to do with them from every trace of anxiety. This was, however, an isolated case. He went on to give other particulars, showing that co-partnership of capital and labour was no mere dream, but a practical solution of a very difficult problem, namely, the reconciliation of those two apparently diverse but really identical interests. Speaking generally, the great weakness of this country was that our great working population had no share in its vast accumulated property, which was the cause of the thriftlessness of the English. The French, he said, were thrifty because they were property owners. He was of opinion that this difficulty would be removed, and that the twentieth century would do for the English working or wage-earning class what the nineteenth century did for the middle class. The wonder was that the wage-earners, having no stake in the country, were so patriotic. But they were not contented with their lot, and that discontent would grow until it became a real danger to the State unless those who had the power and influence to remedy it—namely, the employers—took the matter seriously in hand. The trend of the working classes seemed to be strongly towards Socialism, which meant ruin all round, but if they were made property owners all that would be changed and they would certainly become thrifty, and having a real interest in the country they would take their part in its government with credit to themselves and to its general advantage. In fact he saw no other way of combating Socialism. Given the opportunity and such encouragement as was possible, our working men were not so thriftless as was commonly supposed. Their thriftlessness was due to the fact that they regarded as hopeless any attempt to accumulate, and therefore did not try. When the South Metropolitan Gas Company started their profit-sharing system they gave the men the option of leaving their annual bonus in the company's hands at interest, and, to the surprise and pleasure of all, no less than 45 per cent. did save it. This percentage had gradually increased until at the

distribution last year it had risen to well over 80 per cent. saved. This was the strength of the system. If the annual bonuses had been regularly withdrawn, no permanent good would have resulted to the workmen, and the profit-sharing system would have been a failure and would certainly have been abandoned long ago. If industrial partnership was to be so general an agent in our industrial life, and incidentally in the prevention of distress, how was it, he asked, to be made general, and what were the difficulties in the way of its adoption and success? The first chief difficulty was that employers generally did not see its importance, and were not, therefore, disposed to take it up to give the necessary time and attention to secure success. If employers could be enlightened on the subject, the joint-stock system, by which all great industries were now worked, was just the thing. It was a partnership, and all that was necessary was to include the wage earners. This could be done, recommended by the Labour Co-partnership Association, by paying the profit-sharing bonus partly or entirely in shares in the company. Another difficulty to the introduction of the system was the dislike of the trade unions, for the ultimate success of co-partnership meant that employers and employed would be one, and therefore there would be no need for the trade union as it now existed. It would, in fact, be superseded by a superior system. Partnership in businesses, such as railways and other companies where employment was regular and constant, was, he believed, quite possible and practicable; but where employment was casual and uncertain the co-partnership system was at present scarcely applicable, and unfortunately from the fluctuating businesses mainly came the distress caused by want of employment. Of course, there were many and great difficulties, but there was also great danger to the industrial community and to the State. Something must be done, and it appeared clear that it must be in the direction of co-partnership, which he thoroughly believed was the goal of British industry. Employers were doubtless in many cases fearful of the result of bringing their workmen into partnership, which need cause no surprise; but, so far as his experience went, working men responded most satisfactorily to the trust reposed in them. If and when the working class became possessors of property, one indirect effect in the prevention of distress would be that employment would be more regular and constant, for they would not be merely labourers but, by virtue of their thrift and savings, active promoters of productive industry.

A discussion followed.

THE WEEK.

THE definition of the "sky sign" in the London Building Act is more comprehensive and elaborate than usual, for it means "any word, letter, model, sign, device or representation in the nature of an advertisement, announcement or direction, supported on or attached to any post, pole, standard, framework or other support, wholly or in part upon, over or above any building or structure, which or any part of which sky sign shall be visible against the sky from any point in any street or public way, and includes all and every part of any such post, pole, standard, framework or other support." But a case was brought before Mr. FRANCIS, at the South-Western Police Court, by the Battersea Borough Council, which failed on account of the vagueness of one word in the definition. Does "upon" mean contact with the outer part of a thing or "up on" it? The advertisement in question projected from the front of a building at a considerable height from the ground, but not above the roof, in Northcote Road, Clapham Junction. The theory of the Borough Council was that the words "wholly or in part upon" brought the sign within the scope of the Act, for when seen from beneath it appeared against the sky. On the other side, the contention was that "upon" signified above a building. The magistrate, after visiting the building, came to the conclusion that the board was not a sky sign, for to come under the Act the sign must be on the top of a house. If the Borough Council were right then every advertisement board in London is a sky sign, and would have to be removed. The summons was therefore dismissed with costs. Mr. FRANCIS's decision is justified by the declaration of the Act that sky sign is not to include "any sign on any board, frame, or other contrivance securely fixed to or on the top of the wall or parapet of any building, on the cornice or blocking course of any wall, or to the ridge of a roof, provided that such board, frame or other contrivance be of one continuous face and not open-work, and do not extend in height more than 3 feet above any part of the wall or parapet or ridge to, against, or on which it is fixed or supported."

It is not surprising that after the revelations about the so-called tiara of SAITAPHARNES, now in the Louvre, the authorities of other museums should endeavour to exculpate themselves from the charge of having negotiated for its purchase. An announcement has been made in Berlin which is evidently inspired by the EMPEROR on the subject. All knowledge of the tiara in the Louvre is repudiated. It is admitted, however, that in the summer of 1895, before the tiara found its way to Vienna or Paris, a gold crown with an inscription which it was pretended was found in South Russia was offered to the Berlin museum. The purchase of it was seriously considered. Before the money was paid, ERNEST CURTIUS, the director of the excavations at Olympia, a scholar whose name will always be identified with Greek archæology, examined the work. He was able to announce in July 1895 to the Berlin archæologists that the crown was a falsification. The purchase was not concluded. The crown could therefore not be said to have been acquired for the museum, and further knowledge of it is not acknowledged.

THERE are five grades in the Legion of Honour, viz. chevaliers, officers, commanders, grand officers and grand croix. The last is, however, restricted to those who have rendered extraordinary military or political services. Grand officer may therefore be considered to be the highest decoration obtainable in France. The centenary of the French School at Athens and of the utilising of the Villa Médicis in Rome as a school of art has been celebrated by the elevation of two painters and two archæologists to the rank of grand officers. One is M. WILLIAM ADOLPH BOUGEREAU, who in 1850 won the Prix de Rome at the same time as the late PAUL BAUDRY. After a long career of success M. BOUGEREAU, who is a native of La Rochelle,

is president of the Society of French Artists. His works are generally on a large scale and are pleasing to all classes. M. JEAN JACQUES HENNER was born at Bernwiller, and is therefore an Alsatian. His paintings are comparatively small, and he has a preference for heads and figures in profile. But the smallest of them always asserts itself in any gallery in which it may be placed in the Salon. Although his pictures are highly prized, the artist is not ambitious to gain a reputation for productivity. The name of M. PERROT must be familiar in England through the translation of his great "History of Art in Antiquity," which he prepared in co-operation with the late M. CHIPPIEZ, the architect. But that work is only one of his claims to distinction. For several years he has directed the Ecole Normale, which is the most advanced of the educational institutions for literature. M. LEON HEUZEY, the fourth grand officer, is the professor of archæology at the Ecole des Beaux-Arts. His life has been devoted to Greek work, and his authority is unquestioned on whatever relates to antiquity and which can be supposed to have any bearing on Greek art.

THE trustees of the Manchester Infirmary on Friday last formally accepted the offer of 400,000*l.* by the Manchester Corporation for the site of the existing buildings. Authority was also given to the Board of Management to obtain plans and estimates for the erection of new buildings on the Stanley Grove site. Mr. JOHN THOMSON, chairman of the Board of Management, said they proposed to invite architects who desire to prepare plans to send in applications, together with particulars of their experience in hospital construction. The Board will then select a number, perhaps ten or twelve, of the most likely names, not confining themselves to Manchester, and will ask the selected architects to submit drawings and estimates, allowing to each firm a sufficient sum to cover expenses. Expert advice will be obtained for judging the merits of the designs submitted. The plans which may be pronounced the best will be laid before the trustees as soon as possible for consideration. The competition it will be seen will be limited, and will not be restricted to architects living in Manchester. Whoever is successful will, it is to be hoped, be more fortunate than those who gained in the last competition, but who were not enabled to see their designs realised.

RANWORTH CHURCH, in Norfolk, is being restored under the direction of Mr. J. T. MICKLETHWAITE, F.S.A. A sum of about 1,900*l.* has been expended, and 2,441*l.* will be required in addition. As one means towards obtaining the money an account of the rood-screen has been published by Messrs. JARROLD & SONS. It is written by Mr. E. F. STRANGE and illustrated by Mr. H. P. CLIFFORD. The screen is remarkable. There is no doubt it supported a wide loft of which only a part exists, and for that purpose two timber buttresses of graceful form were introduced which give novelty to the structure. In the panels are figures of saints painted in vigorous style. They are suggestive of florid German work, and Mr. STRANGE concludes they were derived from a set of prints by a German artist. There is no information forthcoming either about the maker or the donor of the screen. It is an interesting example, and when in a perfect state must have caused delight to all who looked on it. The description of the screen is worth possessing as an archæological essay, and the purchaser has the satisfaction of knowing that any profits from the sale will help the restoration fund.

REINHOLD BEGAS is one of the sculptors of whom Berlin should be proud. His group *Borussia* at the Exchange, his statues of SCHILLER, A. VON HUMBOLDT, BISMARCK, and especially the great monument of the Emperor WILHELM, are among the most important ornaments of the city. He has held the appointment of director of the chief atelier for sculpture in the Academy, and many prominent artists were benefited by his skill. Herr BEGAS, after twenty-five years' service, has resigned the office to Professor LUDWIG MANZEL. His departure is likely to cause a secession, and it may be that a rival institution will be set up.

TYPES OF COSTUME: ANGLO-SAXON AND NORMAN.

OPTICAL REFINEMENTS IN ST. MARK'S, VENICE.

SOME of the shortcomings of the churches which represent Italian Gothic have been occasionally pointed out. It was found, for example, that the arching which so often forms the principal decorative element of the exterior of many a building was, without any apparent reason, not throughout of uniform radius in the same arcade. The lines of the panelling or decorative arching were not always continuous from base to roof. Shafts of columns occasionally varied in length, and then there could not be uniformity in the capitals. Many other peculiarities, or rather irregularities, were noted. Indeed, it has been supposed the style owes its character to travestying Classic forms. The absence of unity is explained by saying that an Italian church was not often commenced and completed under the same supervision. It must be admitted, however, that, compared with other styles, little attention was given to the study of Italian Gothic. It was rarely used as a direct source of inspiration in this country, and did not in consequence receive that scrutiny which comes from measurement in detail. At a later time, when photographs could produce more exact views than were hitherto possible by drawings, any aberrations which presented themselves were ascribed to defects in the lenses.

The discoveries of PENNETHORNE and PENROSE might be supposed to be suggestive of the possibility of discovering deviations from exact perpendicular and horizontal lines in Italian churches. There was no reason why similar efforts to compensate for the weakness of vision should be abolished with Paganism. The early Christian masons and their successors were not, perhaps, distinguished by their knowledge or skill, but they might be considered as having sufficient ability to continue a practice which at an earlier time was adopted. It would be wrong to assert that the modification which consisted in the substitution of one kind of line for another was unknown in Italy in the Christian period. Only a general knowledge is to be obtained of the characteristics of the buildings, for, as we said above, men do not investigate structural peculiarities unless they have some confidence they will be able to turn their researches to account. As a rule it will be found that English architects rarely become enthusiastic over the class of work which was produced in Italy for a long time prior to the Renaissance. Until JOHN RUSKIN made St. Mark's the subject of his impassioned prose-poetry, we believe most English visitors would agree with JOSEPH WOODS when he asserted that the exterior of the building surprises by its extreme ugliness rather than by any other qualities. The countless columns, he said, were the spoils of Constantinople and the Levant, but the capitals were so rude he thought they could be only home manufactured.

In spite of Mr. RUSKIN's eloquence, it has been difficult to utilise St. Mark's or any of the older churches as models for English buildings. If they could have served in that way it would not have been left to an American professor to disclose the remarkable refinements, illusions and examples of constructive asymmetry in so many

Italian buildings. But he deserves credit for his earnestness when so many people were indifferent. French architects are reputed to be familiar with all the subtleties of their art, but it was reserved for Professor GOODYEAR to demonstrate there were horizontal curves in the Maison Carrée at Nîmes as well as in the Parthenon. That discovery does not seem to have earned for him much gratitude from Frenchmen, and no notice appears to have been taken by any of the English architectural societies about what he has succeeded in revealing concerning Italian practices. We have already on more than one occasion endeavoured to suggest what Professor GOODYEAR has accomplished. But as St. Mark's, Venice, has of late attracted increased attention through its escape from destruction by the fall of the Campanile, we desire to return to the subject, especially as that building has been made the subject of his most exhaustive investigation.

In 1870 Professor GOODYEAR noticed that the casing of certain piers in St. Mark's had been cut obliquely so as to fit and correspond with a system of vertical inclinations which receded outwards. The leans of the pillars could therefore, he thought, not be less ancient than the casing itself. He subsequently came to the conclusion that the Venetian basilica was no solitary instance of a departure from verticality. But not until 1895 was he able, with the aid of an engineer, to make a special survey of the phenomena in St. Mark's. The results when systematised confirmed his former conclusions. They also recalled what JOHN EVELYN wrote in 1666 about Old St. Paul's, viz.:—"Finding the main building to recede outwards, it was the opinion of Mr. CHICHELEY and Mr. PRAT that it had been so built *ab origine* for an effect in perspective in regard of the height; but I was, with Dr. WREN, quite of another judgment, and so we entered it; we plumbed the uprights in several places." Apparently neither WREN nor EVELYN believed in deviations to obtain the effect of verticality.

The matter received so little attention from preceding observers—for even RUSKIN judged of irregularities without any elaborate measuring—we can understand why Professor GOODYEAR was anxious to have his discoveries certified by the engineering architect of St. Mark's. When the proposal was unfolded to him, Signor SACCARDO was "politely sceptical as to constructive widening or spread." On examination with the Professor, "he frankly acknowledged that he had not previously realised the full amounts of the outward leans as these were made known to him through the published measurements of 1897." The difference is not slight. The north walls lean back about 16 inches and the south 15½ inches. No settlement of foundations could produce so large a deviation without a collapse. Signor SACCARDO at once realised that the leaning must have been intended for constructive purposes.

Afterwards he prepared a statement or certificate testifying to the accuracy of the demonstrations. According to him the inclination of gables and pinnacles, which was not unusual in Mediæval architecture, is visible in the principal façade of St. Mark's. It is otherwise on the lateral façades, owing to the architect who restored them thirty years ago, not understanding the artifice, and arranging the pinnacles

in an upright manner. It is also observable in the neighbouring Porta della Carta, which is of Renaissance construction. The principal façade of St. Mark's is besides laid out on an inward curve. The pinnacles are of unequal height and rise towards the centre. Signor SACCARDO gives credit to Professor GOODYEAR for discovering the forward leans of the lower columns of the façade, while those over them are perpendicular, the leaning inward of the interior piers supporting the larger domes, and the convex curvature of the parapets of the galleries connecting the arcades of the transept. Although some distortion may have been caused or, at least, augmented by the pressure of the masonry on the yielding soil, the deviations are too uniform to be regarded as purely accidental.

Signor SACCARDO accorded permission for the closest examination. Professor GOODYEAR undertook a series of plumbing experiments in order to ascertain how far different parts of the building varied from the perpendicular. This was undoubtedly an onerous task, and the full report of the results is to be found in one of the memoirs of the Brooklyn Institute of Arts and Sciences. Drawings and photographs show the very numerous points at which the observations were taken.

Professor GOODYEAR believes that the refinement of widening the vertical lines in the rising direction is nowhere so consistently applied as in St. Mark's. He thinks it originated in the belief of the builders that it was an improvement. We have become so accustomed to "absolutely rectilinear buildings, with mathematically accurate measurements of construction and with absolutely symmetrical correspondence in all architectural members and features, which has even exalted these things as an ideal of perfection in building; that the whole subject of architectural refinements is a matter of difficult apprehension." At St. Mark's there is no doubt that the effect of spaciousness in the upper portion of the church is much enhanced by the arrangement. It is also clear that the graceful bend of the verticals is preferable to the rigidity of the straight line.

It is remarkable that with the Renaissance there came indifference to the old method. It was practised, however, as late as the time of PALLADIO. Professor GOODYEAR has discovered the phenomenon in the façade of St. Ambrogio, Genoa. Signor DE ANDREIS, an engineering architect, says that the lower part of the façade has a vertical inward inclination of about 20 centimetres in a height of 50 metres. The church was erected about 1590 from the design of a Jesuit priest. Probably it is the only Renaissance example of the treatment existing in Italy. The adoption of the practice was different in an earlier time. Thus the architect in charge of Pisa Cathedral has testified to the correctness of Professor GOODYEAR's statements that the façade of the Pisa Cathedral was intentionally inclined in the original construction; that all the curves of this building, both the horizontal and the vertical, were intentionally made in the original construction; that the oblique lines of the interior galleries were built as they now appear; that the main exterior cornice is oblique by construction. In the ancient church of St. Ambrose, Milan, it was found by plumbing that a pier in the nave nearest to the choir receded 6 inches at the capital. Many similar instances are also cited.

It is hardly to be expected that Professor GOODYEAR's discoveries will have any immediate effect on modern architectural designs. But if it can be realised that true lines were not always formerly adopted the peculiarity should be respected. In Mediæval structures some deviations of the plan have been considered symbolical, but it is doubtful whether DURANDUS himself would be able to interpret the widenings and forward inclinations as having any reference to mysticism. The Greeks being mathematicians there is no hesitation in considering their variations as evidence of great skill in construction. Why there should be any hesitation in the case of the Mediævalists is not easily explained.

A Site in Cathedral Avenue, Calcutta, has been recommended for the Victoria Memorial Hall. In order to have the building fully displayed it will be necessary to remove the existing goal. The sum of 50 lacs of rupees having been subscribed, the work is likely to be soon commenced.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER IX.

FENESTRATION AND PORTALAGE.

A TREATISE of this nature, though essentially devoted to the principles of design, would scarcely be fulfilling reasonable expectations in the absence of some notes on fenestration and portalage. The former is, indeed, a matter of great importance since the repeal of the window tax—within the memory of many still living. To say that light comes as well and efficiently through a square hole as through artistic dressings would be an unworthy plea for neglected consideration of fenestral decoration; such a plea being established, *mutatis mutandis*, objection should not seriously be raised to the sack as the staple article of clothing.

Window treatment has been, of course, a matter receiving consideration even from early days, but with its history this treatise is not concerned.

Some remarks on window treatment have already been made in an earlier chapter. In continuation, it will have been gathered from the general trend of these articles, fenestration should be ancillary to the plan, to the extent that the building's requirements call for certain general dispositions. But such requirements being satisfied, the disposition of the windows should be guided by the artistic demands of the elevations, and to this extent the latter will guide the plan.

It is generally allowed as a theory, that the superposition of windows should be in a graduated scale from heavy to light, from the lowest storey upwards. That many disregard this maxim is a matter of common knowledge, and truly it may be carried to excess, whilst containing a principle of fundamental value. One point that it is of importance to remember, is to vary the window head sufficiently to prevent monotony, but not to an extent that will create an appearance of restlessness. In this connection, it may be noted that whilst the Italian palaces possess considerable artistic merits, some of them show unvaried repetition of detail to the very limits of tedium.

It may be also noted with advantage that an excess of square window heading is preferable to an excess of semi-circular treatment; the preference depending merely on the form, as referred to earlier. Sometimes the elevations, as treated, create the impression that their designers pin their faith for obtaining elegance (an abominable quality) on the minimum use of squareness; a certain meretricious pleasingness (the word may pass muster for the occasion) is often obtained, but is as far removed from good design as it can possibly be.

Fussiness is not design, nor is emasculation. Some people think—and of that number is the writer—that the Apollo Belvedere is a greater *chef-d'œuvre* than the Venus de Medici. In other words, the highest beauty results from a well-considered combination of strength and grace. And whilst these are effective in latitudinal combination, they are also, as has been intimated above, to receive attention in graduated treatment in a vertical direction. The Greeks and Romans were pioneers in fine art, more particularly the Greeks, and a study of their methods will well repay for the time so devoted.

As is sufficiently well known, however, the ancients did not develop window treatment to a large extent, but the principles apply as for general decoration.

Everything else being equal, it is advisable to contract the width of the window openings to a slight extent in proportion as they are placed at levels above that of the average spectator; but this contraction in width may well be accompanied by multiplication in number, and by this means due balance will be preserved.

Whether the window openings shall be flush with the wall surface, or whether they shall project or retreat must be decided in each case on its merits, and its possibilities—similarly as to the "style."

A means of obtaining adequate lighting to large rooms without risking a surfeit of small openings is to provide

fewer and larger openings, which can be rendered artistically pleasing by the use of mullions and transoms. And here may be noted a difference of treatment necessary according as the requirements are utilitarian or otherwise. In premises for retail trade the object is to obtain a maximum of window for the twofold object of good lighting

fantastic outlines for window cases; in well-regulated simplicity is to be found the most satisfactory treatment.

The use of pedimented window heads should be much more restricted than it has been for centuries; a pediment is rather meaningless except as the crowning glory of a façade. It is not desired here to labour this theoretically

Various designs for windows.

and extended display. To effect this not only are such details as mullions and transoms forbidden as a rule, but sash bars and ventilating gratings or panels are reduced to the utmost, and the constant endeavour is to increase the area of the plate glass.

There is nothing to be gained by the introduction of

as a principle, but as a matter of practice the restricted use will be found desirable. If, however, pedimented heads are to be used, they should be advisedly limited to the highest of the main storeys. An "attic" which is valuable as tending to give counterpoise, should receive distinctive window treatment; a series of circular lights

will often look effective, though even the greatest purist should not take objection to square-headed "attic" windows, whether or not surmounting circular-headed windows to lower storeys.

The term "window case" has been used a few lines above. There is, of course, a distinction between this and a mere window opening. By the former is to be understood a more or less decorative enclosure of the opening, but to a greater extent than is provided by the Gothic and early English Renaissance treatment. The various contours of arches, the "long-and-short" stone dressings, the toned brick dressings and other modes of treatment for window openings are sufficiently well known. The Italian Renaissance window case may be very effective when well-proportioned. In the accompanying fig. 71, various outlines of window openings and "cases" are given, for it is true that an inch of illustration is often as valuable as a yard of text.

(To be continued.)

ART FORGERIES.

IN a letter to the *Times* from Florence, Mr. B. Berenson says:—Whether the famous tiara of Saitapharnes turns out to be a forgery or not, the discussion will have done much good in bringing before the public the general question of forgeries. That there is nothing impossible in the Louvre authorities falling victims to fraud is proved by at least one of their recent purchases. The body that could buy the obviously cinquecent copy of Desiderio's famous *Putto* at San Lorenzo, believing this statue of forms at once mincing and puffy to be Desiderio's own handiwork, would seem to be the natural prey of the clever forger.

And if a responsible committee, living under the continuous menace of public reproach, is thus liable to error, how much more the irresponsible private buyer. Last spring at Christie's there was exposed for sale, and in fact actually sold for a relatively large price, a picture by a now well-known Sieneze forger, a picture that several of us had seen brand new on the painter's easel, before it underwent the process of staining and cracking and "worm-holing." To draw "un po' di mistero"—a little mystery—over the face of a picture is a process well known in Italy; and even for those who live there and keep their eyes open, the veil of mystery is not always easy to lift. For the Italians, from the Quattrocento on, have always been clever forgers, and the technical skill of the race that produced the greatest European school of painting is by no means dead. Taste is dead, and honesty has not yet come to take its place; but extreme dexterity remains. And this dexterity is now more and more turned to account to satisfy the constantly increasing demand for old masters. Their facility enables these forgers, as soon as the public begins to get on the track of a certain kind of falsification, to change to another style so different that only the eye trained to know a painter's work as the expert knows handwriting, almost by the pulse-beat vibrating in the stroke, can follow the Protean metamorphoses. My Italian friends addicted to this practice are constantly bringing me fresh specimens of their skill hoping to wring from me the confession that this time, at least, I could not, left to myself, have followed their doublings.

It is by no means an unknown case in literature that a writer may possess great talent as a forger, while being incapable of doing even mediocre work on his own account. And so it is with these imitators in paint and bronze and marble. When left to themselves, without a classical model, they can produce nothing but vulgar and flashy specimens of the "Art Nouveau," which, in his heart, the average Italian greatly prefers to anything in his *patrimonio artistico* he is so eloquent about. But as imitators they are admirable, betraying their native bad taste only in the most subtle ways that may well escape even the best educated dilettante. There are, indeed, amateurs who take the ground that, if the work of art is beautiful, it makes no difference whether it is a modern forgery or a genuine production. These people forget that a large part of our enjoyment of art depends upon the good-will which we bring to its contemplation. No considerable work of art but has its defects; but we forgive them, we even do not see them, if we are well disposed to the object as a whole. But the moment the fatal word "forgery" is pronounced these defects start into prominence, and little by little our loss of associative pleasure reacts upon our vision, and we actually see the object as less and less beautiful.

The curious thing is that these Italian forgers, unless they chance to be dealers as well, which is often the case in Italy, make very little money by this work. A few hundred francs will satisfy their happy-go-lucky natures, for the adventurous, dare-devil spirit of the Renaissance is still alive in them. And

for all born forgers (the born forger is scarcely less common than the born artist) forging is its own reward. A volume would scarcely suffice to develop this theme—and what a fascinating volume, by the way, it could be, if one did not confine oneself to art alone, but included literature and even scholarship. But to return to our subject. It is the dealers who make the enormous profits out of the credulous amateurs and ignorant gallery directors. A dealer who is also a forger has an undoubted advantage; and in this connection I feel that the public ought to be especially warned against some of the cleverest dealer-forgers whose centre of operations is Florence. These artists get hold of old ruined panels with just enough patches of the original paint left on them to enable them, if suspicion is aroused, to experiment on these carefully chosen parts with solvents that would destroy modern work, and to point triumphantly to their resistance as a "scientific proof" of the picture's genuineness. The rest of the panel they fill in, with undeniable skill, in the style of Filippino Lippi, Ghirlandajo, Raphael—whom you will, according as they think they can snare their purchaser. Their productions are rarely to be found in such a vulgar place as a shop; they are "discovered" in old palaces and castles, sometimes in the most out-of-the-way villages of Tuscany, and they boast an undisputed pedigree, sworn to by some spendthrift scamp bearing an historic name. What wonder if the unsuspecting American or English buyer is taken in, especially if the dealer has the cleverness to hypnotise them by dangling the picture before their eyes as an unheard-of bargain.

If my remarks have been followed to this point, it may pertinently be asked how the well-meaning collector is to escape the forger? Escape absolutely he never can. Even the expert buys his experience at the cost of his purse and his vanity. He can only hope to avoid being too grossly deceived if, having a definite passion as well as talent for the subject, he devotes himself seriously to training his eye to distinguish quality. Let him not imagine that a practical acquaintance with last year's forgeries will prevent his falling victim to this year's crop. Moreover, let him not pay the slightest attention to supposed pedigree or provenance, nor to the various papers and documents and alleged traditions that purport to guarantee the genuineness of a work of art, for these are much more easily forged than the work of art itself, nor is there anything to prevent a picture being painted or a marble carved to correspond with a description in a perfectly authentic document. Nothing but a fine sense of quality and a practised judgment can avail against the forger's skill. Technical, documentary, stylistic standards may all be satisfied, but the one thing the forger cannot do is to satisfy the standard of a specially trained taste, and to avoid betraying himself by some mannerism of his own which the experienced eye can learn to detect.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE second annual general meeting of this Society took place on Monday, at 13 Harrington Street, Liverpool, under the chairmanship of Mr. John Woolfall, the president for the ensuing year. Other officers elected were:—Messrs. T. E. Eccles and P. C. Thicknesse, vice-presidents; Hastwell Grayson and Gilbert Fraser, hon. secretaries; James Dod, hon. treasurer; Alan G. James, hon. librarian; H. P. Mortes and W. Glen Dobie, auditors. The following were elected Fellows of the Council:—Messrs. J. Dod, H. Hartley, E. P. Hinde, E. A. Ould, S. Pugin, W. E. Willink and Professor F. M. Simpson. Associates elected for the Council were:—Messrs. Alan G. James and A. Thornley. The annual report showed that the past session had been marked by steady progress. The total membership was now 154. The most important event of architectural interest during the year had been the preliminary cathedral competition. The report stated that the City Council had just held an important competition for workmen's dwellings, in the conditions of which it was carefully stated that they reserved the right of rejecting all the plans sent in and entrusting the work to the city surveyor. The City Council had adopted this course. Their action, however, in putting architects all over the country to great trouble and expense and then rejecting the plans, although legal, was very regrettable, and would probably affect future competitions. At the close of the proceedings the President alluded to this matter and remarked that if the Corporation asked architects to send in plans any plans submitted by their own officials should be put side by side with others and the whole should be judged on their merits.

The District Council of Wolstanton have consulted Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Wolverhampton, to advise them as to the sewage disposal of the various townships in their district.

TESSERÆ.

Uniformity in Architecture.

THE development of the organ of order in the human system, by the application of it in every description of physical arrangement, is at once the most conclusive proof of its existence and of its imperative nature. As an acquired rule of life, it is an habitual possession, but it is more primitively of an instinctive origin; because those who are most distant from its acquirement are equally ready to own its supreme value and to envy it in others. In commercial affairs, the want of it is a disgrace; in domestic life, it is the matron's ambition; in dress, it is perfection. It is admirable in business, for its convenience; at home, for its comfort; and personally, for its example. The influence it has upon architecture produces, as one of its results, uniformity. In defining the expression uniformity, it is considered as alluding to the correspondence or similarity of the parts of an object, or too objects collectively, with each other, in the form of a whole. Architecture, which is often mentioned in the same breath with painting and sculpture, must on this topic be separated. The copyist of nature, in the various forms of creation, finds nothing either so far similar in itself, or with other objects, to justify the term uniformity in its representation. Were the human figure to be delineated in a geometrical manner, with each limb corresponding in altitude to its opposite, it certainly might then be uniform, but it would not properly depict life; and, in fact, any attempt to extract such a principle of exactitude from the appearances of natural productions must fail, when their infinite multiplicity of variations seems quite to banish such a thought. Although architecture, in this particular, cannot claim to be an imitative art, it is the more so one of invention, in suiting itself, by constructive uniformity, to the reasonable habits and tastes of mankind. In erections of more than ordinary altitude, as, for instance, towers, steeples, domes and the like, where they are seen from many points of view and at considerable distances, rising above inferior objects, they usually present the same appearance in each prospect. In the case of such a building being on a circular plan, a more complete uniformity can be achieved than in any other form, and hence such a form becomes the most simple and compulsory occasion for its adoption. When the purposes of a structure will admit of, and be best answered by, uniformity in its interior arrangement, it follows, as a matter of course, that the same may be kept up throughout its exterior, provided it is insularly situated; and no architect would neglect such an opportunity, by not adopting so desirable a method. This kind of uniformity may be generally attained in designing sepulchres, baths, fountains and minor architectural erections; but its most frequent and important application is in churches and other buildings, either for congregational or limited assemblies. In many of such instances it happens, as in St. Paul's Cathedral, that the whole building, both plan and elevation, may be bisected by an imaginary line, with the nicest impartiality, leaving to each half the exact reflection of itself in the other; though each, being so separated, is no longer uniform, but derives its merit in this respect from being exactly similar to the other; thus producing, as it were, a united effect by a twofold accordance. This manner of disposal in architecture, while it leaves every room for uniformity of details and general similitude of character, works its ultimate advantage by restricting its great likenesses to the smallest possible number of portions; and which, to judge by the above example, powerfully conduces to grandeur. There is a singular specimen of uniformity, somewhat of this class, in the Banqueting House at Whitehall, where the front and its reverse are precisely similar, though, of course, completely hidden from each other.

Fabric Accounts of Exeter Cathedral.

The records at Exeter contain interesting information. The painting in the lady chapel has existed since 1301. There is a bill for painting in that year forty-nine bosses, and otherwise colouring the vaulting. There are thirty-one in the lady chapel and eighteen in the two side chapels. In the first year of the fourteenth century the lady chapel was completed, for it could not have been painted and coloured until the wall part was finished. The windows present very early specimens of that period, and the bosses are carved in a great variety of foliage, all the leaves being gilded and the branches painted in different colours. According to the accounts, the roofs of the two side chapels were painted in imitation of the sky, with the gold stars and silver moons. For the eight windows, four on each side, which form the presbytery, or eastern part of the choir, the Chapter possess a bill taken from the accounts of 1301, showing that one Master Walter, the glazier of those days, received 4*l.* 10*s.* each for glazing the whole of those eight windows. The quantity of glass in each window was exactly named. The two side ones contained 1,271 feet of glass, according to the bill. Each of them was 25 feet high by 10 feet broad, and contained 275 square feet of glass. Each cost

6*l.* 10*s.* The smaller clerestory windows, 19 feet by 10 feet, cost 4*l.* 10*s.* The whole of them were filled with stained glass. The episcopal throne was placed where it stands in 1317. It used to be referred to the date of 1470, but Sir Gilbert Scott pronounced it on first sight to be of the earlier date, and since then the bill has been found for it, supporting his judgment. It was built by Bishop Stapleton in 1317. It was entirely of wood, was 57 feet high, and contained a number of figures that are now lost. It was of carved oak, and was originally coloured. The oak for it cost 4*l.* 10*s.*, and the carving 6*l.* 10*s.* There is also a bill for the carving of thirty large bosses of the vaulting in Bishop Bytton's time, in 1305. They were carved for 5*s.* apiece, the work being done on the ground, and then the bosses were lifted to their positions. Every fourth boss was the key of an arch, so that if it were removed the whole arch would fall. There are very happy devices used in the carving of the figures, and the style adopted was a favourite mode of ornamentation.

Detail and General Effect.

If we are content to put up with detached and piecemeal beauties we may be satisfied with anything, for that must be a most vile production indeed in which every one of the parts, taken merely as parts, is absolutely bad. Architects so very rarely attempt what they can claim exclusively as their own, that it is chiefly by the general conception and treatment of their subject, by the adjustment and collocation of the various divisions and subdivisions, that they can show any superior taste or originality. Their columns and entablatures are little more than so many formulæ, the property of no one in particular, and to be appropriated only by a felicitous combination with all the rest. What is it but the admixture of his pigments and their collocation on the canvas that distinguishes the able colourist from the dauber? The palette of the one is just as richly furnished as that of the other. What is it except his power of masterly collocation and combination that constitutes a great musical composer? His gamut is just the same as that of others; he has no new elements of sound; his magic lies in the mastery with which he elicits, from those common to all, new and striking combinations peculiarly his own. What, again is it, save the same power that distinguishes a noble poetical diction and style from an ordinary one? Is it not precisely that harmonious and eloquent disposition and structure which any other collocation of the very same words would fail to produce? It is arrant stuff, then, far worse than sheer nonsense, because more pernicious, to talk of the proportions of individual parts if there be no aggregate proportion—no proportion, as regards feeling and taste, in the arrangement of the parts themselves. The best that can be said of works so constituted is that they have shaped out the material of which others may avail themselves with better success. Too minute criticism, which looks exclusively to the separate items of a design without at all attending to their result or gross amount, has been one great bane of the art. It fosters a narrow petty taste, an attention to insulated particulars or circumstances, with very little consideration of, or regard to, the whole. The study of general effect and proportion alone is not to be recommended, quite the contrary, since too much care cannot be bestowed upon detail; but then it must be as detail, as the finishing touches and working up of what is ably conceived. No minutiae should be suffered to escape attention; nothing should be slurred over, as we generally find to be the case; yet, as a first and most important step, it is requisite that the elements of a superior design should be established in the leading ideas. So very far is general propriety or beauty from excusing inattention to individual merits, that unless every single feature and its detail be appropriately finished up the ensemble will become a mere sketch or a crude unsatisfactory production if considered in any other light, and it surely need not here be observed that when we come to execute in such expensive materials as stone or brick something more than a sketch, however clever it may be, ought to be looked for. It is all the more necessary to insist upon this, because, although even the authority of Palladio would not now persuade many to fall into the grosser errors with which his buildings and designs abound, architects of the present day too readily content themselves with merely avoiding radical vices of that kind. They certainly commit fewer solecisms, but it is not quite so certain that they give us a greater number of positive beauties. If their orders are better because copied from the antique, it seldom happens that we find much else to admire, or anything very felicitous that is peculiarly their own.

The Carracci and Eclecticism.

The Carracci, the founders of the Bolognese school, though not absolutely equal to their great predecessor Correggio in chiaroscuro, excelled him in design, and perhaps in some other branches of painting. Lodovico, in particular, is highly and justly extolled for the modest breadth and affecting simplicity of his style, and pointed out by Sir Joshua Reynolds as the best model for that dignified tone, that solemn twilight, so produc-

tive of sentiment, and so properly and exclusively suited to all subjects of a grave, philosophical or religious character. Lodovico, with his two cousins, Annibal and Agostino Carracci, attempted by selecting the beauties, supplying the defects, correcting the errors and avoiding the extremes of their predecessors, to unite all the excellences of the art and form a perfect style; a plan which has been derided by some eminent critics as absurd, visionary and impracticable; but as they have neglected to show wherein the different merits of the different schools are incompatible with each other, so they have failed to convince us that the attempt to reconcile them was ill-judged, and tended directly or indirectly to mediocrity and the extinction of character. What if the Carracci have not completely succeeded? What if they be in some degree inferior to each of those whom they proposed to imitate in his particular way—to Michel Angelo in design, to Raphael in expression, to Titian in colour and to Correggio in force and harmony of chiaroscuro? The combination, as far as it goes, is excellent; and that it is not more so is undoubtedly owing to nothing absurd in the attempt, but to insufficiency of ability to carry it properly into execution. For where is the proof that all the different beauties of art are not in perfect unison with each other? That the whole is more difficult to grasp than a part is not to be denied; but let us beware of making our feebleness the measure of possibility. Had there been more correctness in the drawing, more elevation in the character and more truth in the expressions of the *Notte*, the celebrated picture by Correggio, can it be supposed that its effect would therefore have been less splendid and fascinating? and had the *Transfiguration*, by Raphael, partaken more of Michel Angelo's grand style of design, and of the breadth and splendour of Correggio's chiaroscuro, which the subject seems particularly to demand, can it be supposed that these excellences would have lessened in any degree the truth of expression which it now possesses, and that it would therefore have become insipid? Can it be supposed that *The Hours Leading out the Horses of the Sun*, painted by Giulio Romano, would have been less poetical and celestial had they possessed more harmony, brilliancy and truth of colouring? Celestial objects, according to our conceptions of them, differ from terrestrial ones not in essence but in beauty, not in principle but in power; and our representations of them should possess all the splendour and effect, as well as all the vigour, spirit and elevation of character possible. To a certain portion of spirit and character it was doubtless owing that in spite of, and not by the aid of defects, Giulio Romano's horses became objects of admiration; and had these excellences been joined to the others with which they are always associated in our minds, the effect of the work must have been proportionally greater, and it would have consequently stood still higher in the scale of art.

Stained Glass Preserved by Le Noir.

At the time of the French Revolution Le Noir, the antiquary, had sufficient influence with the governing powers to remove some of the more beautiful pieces in Paris, to collect the fragments and to preserve the whole from further demolition by placing them in a national museum. Others were bought by dealers to be sent to England. In Le Noir's catalogue the following examples are mentioned:—Abbot Sugerius placed stained glass in the church of Notre-Dame about the year 1150, but the subjects were in general small and the artists unknown. At the Cordeliers there were moral subjects taken from domestic life in the thirteenth century. In the church called "La Jussienne" (Egyptienne) was the Legend of St. Mary the Egyptian, 1390, and the family of Charles VI. in the Orleans chapel. Herron, 1430, made a window at St. Paul's on the subject of Paradise. From the Temple, 1471, were taken Life and Death of our Saviour in a large size, by Albert Dürer. As the glass was thick he drilled the eye-balls to give them brilliancy, which method was afterwards adopted with frequency. They once filled twenty windows. From the Célestines, 1490-1560—The works of Bernard van Orley, born at Brussels and patronised by the Emperor Charles V. Having much drapery of blue semée de lis, he coloured the glass only on one side, he then drilled the figure of the fleurs de lis on the surface and stained them yellow, and after that operation shaded the whole and passed it through the fire. From the chapel of Vincennes.—The works of Jean Cousin, a scholar of Raphael, who has painted the most admired windows in France, so beautiful that they imitate the pictures of Giulio Romano on canvas. There are portraits of Francis I. and Henry II. as large as life. From the Minimes de Paissy.—The works of Robert Pinaigrier, who was employed by Francis I. at St. Victoire, chiefly royal portraits. He stained the windows of the cathedral at Chartres, and was much employed at Paris, at St. Jacques la Boucherie and St. Croix, &c, but a beautiful collection of his works from St. Etienne du Mont is still preserved. From the Castle of St. Ecouen.—Story of Psyche, executed from cartoons of Raphael in chiaroscuro by Bernard Palissy, 1545, originally

thirty pieces, twenty-two of which were preserved. They are painted only on the surface and not stained throughout. Le Noir has published a series of etchings from them. Others from the designs of Primaticcio and Parmegiano are scarcely less beautiful. Church of St. Gervais.—Works of Perrin, from the designs of Eustace le Seur, in chiaroscuro. The windows of the choir in 1587 were done by J. Cousin. The sons of Robert Pinaigrier—John, Nicholas and Louis—who were very eminent at the commencement of the seventeenth century, contributed to adorn this church. Church of the Feuillans.—The Life of John de la Barrière, the founder, in twelve compartments, by Benoit Michu, 1706.

Illusions of Intersecting Lines and Planes.

When a straight line is cut by a series of concentric circles or arches of such circles, or when it is cut by small arches of circles slightly curved, or when it is cut by a number of other straight lines at very oblique angles, the straight line thus cut no longer appears a straight line. A slight refraction, as it were, or bending, appears to take place at every intersection. Hence if such intersections were to occur in any combination of forms, such a combination could not be beautiful. Burke might have said that this defect of beauty arose from "sharpness of angles causing a twitching or convulsion of the optic nerve," and his conjecture would not have been a very erroneous one, however incorrect would have been its mode of expression; for the effect is produced by the action upon the retina of sharp luminous spaces contained by dark lines, which, like the action of luminous points and close parallel lines, invariably disturbs vision. In the beautiful forms of Grecian architecture no such intersections of lines are found. The combination of straight lines, which forms so remarkable a feature in Greek temples, takes place at right angles, and it is in the pediment alone where the lines meet obliquely. There, however, the triliteral form was necessary to complete that general harmony which arises from the vision of triangular, quadrangular and curvilinear forms, and the injurious effect which arises from the meeting of lines obliquely is prevented by the discontinuance of the lines at their point of contact. But the most interesting illusions connected with the vision of forms are those which relate to plane surfaces stretching out from the eye or walls standing in front of it. When the celebrated philosopher Bouguer was in Peru he made a number of valuable experiments on this subject. When ascending with his companions the steep flanks of the Cordilleras of the Andes he found that they became inaccessible when the inclination to the horizon was from 35 deg. to 37 deg. The traveller could no longer make his way unless he found stones to serve him for steps or clung to the shrubs and plants in his path. Under these circumstances M. Bouguer and all of his party agreed in estimating the inclination of the slope at 60 deg or 70 deg. In continuing these observations, he found that the difference between the real and the estimated or apparent inclinations of planes stretching from the eye varied from 0 deg. to 25 deg. or 30 deg. at a maximum. When the plane is horizontal the apparent plane rises above the horizon about 4 deg. or 5 deg. The difference between the two increases as the real plane becomes more inclined, and at a particular angle not exactly determined that difference is about 25 deg. or 30 deg. The difference continues even when the real plane is inclined 9 deg., or is vertical like the wall of a house. But what is very curious, the apparent plane is still above the real plane when the latter dips below the horizontal line, or, in other words, the real plane or declivity is more steep than the apparent one. When the inclination of the descent is between 20 deg. and 25 deg. the real plane and the apparent plane coincide, and passing this angle the real plane is less steep than the apparent one. When the plane is a vertical wall rising above the spectator Bouguer has found that it appears to hang over, as if it were falling towards the observer. When the planes are horizontal and extended, such as a flat champagne country, the same eminent observer has found that its form as well as its inclination is changed. Such a plane has the appearance of a curved surface, the curvature of which approaches to that of an hyperbola, having its centre at a certain depth (greater than the height of the observer's eye, but not double of it) below the feet of the observer, with its first axis very short and its second axis very long. The first part of the curve, where it springs from the observer's feet, is sensibly coincident with the asymptote, or inclined 4 deg. or 5 deg. to the horizon. Beyond this the curvature increases, but quickly degenerates into a straight line. When the height of the observer increases the centre of the hyperbola is the more depressed, and the asymptote the more inclined to the horizon. When the spectator is placed at a great height above the plane the simple dimensions of the curve do not at all change in the same proportion. The centre of the hyperbola from which the asymptote sets out is more depressed in proportion, and the angle which the asymptote forms with the axis becomes more acute, but the part of the ground which appeared to coincide with the asymptote acquires always a greater extent.

NOTES AND COMMENTS.

THE late CHARLES HANSOM, of Bristol, designed many buildings, but there was not one among them of which he was more proud than the group known as Clifton College. One proof of this is seen in the introduction of himself and the headmaster in the view of the library we published. So soldierly an architect, if he were still amongst us, would be prouder on learning that no less than three hundred and twenty-eight of the youths who studied in his buildings served in the South African war and the death-roll was forty-four. It was wisely decided that there should be some memorial of the part taken by so young a school on behalf of the country. It was difficult to determine what form it ought to assume. Eventually the projects were narrowed to three, viz. an architectural monument on the terrace overlooking The Close, a gatehouse in College Road, and an ante-chapel. Old Cliftonians throughout the world were asked to state their preference. An architectural monument was found to be the favourite. The competition was confined to Old Cliftonians, and Mr. R. SELDEN WORNUM was appointed assessor. The first prize of 25*l.* was awarded to Messrs. W. S. PAUL & R. C. JAMES, the second to Mr. E. W. MARSHALL, and the third to Mr. P. S. WORTHINGTON. The design selected shows a four-sided pedestal of Bath or Portland stone, with a brass tablet on each face, and surmounted by a bronze figure. What kind of statue is not yet settled, but Mr. G. F. WATTS, R.A., suggested that it should be a soldier with the motto "Faithful unto Death." It is intended to carry out the design of Messrs. PAUL & JAMES, and to ask for further subscriptions. The amount collected or promised is 1,309*l.*, but from 1,700*l.* to 2,000*l.* will be needed to realise the scheme, including the statue.

A COLLECTION of notes on the repair and restoration of buildings has been issued by the Society for the Protection of Ancient Buildings, and is being sold on behalf of the Society by Mr. BATSFORD. It contains a copy of the principles of the body as set forth in a declaration which appeared in 1877, and which still governs the action of the committee. Some of the charges made against the Society are rebutted. The notes will enable those contemplating restoration to realise what is desired by the Society. It is often supposed that the objections raised to the proposals of architects are only whims, and that there is little uniformity in the manner of dealing with buildings or criticising projects. The collection of notes will, to some extent, make it necessary for contradictory decisions to be avoided. The Society would be more successful if there was less assumption of infallibility, and that may be partially checked by the publication of the principles which are intended to guide the committee, at least for the present.

THE announcement that a party of fishermen had dredged from Greek waters in the neighbourhood of Solona the statue of a man in good condition may relate to one of the fabrications now common, but it would not be unreasonable to expect a work of ancient art to be found there. Solona does not immediately adjoin the sea, in fact it is a couple of hours' journey to the coast. But Delphi is still nearer. In both places statuary was once to be seen. Delphi still commands attention from its ancient history, and it has been selected for excavation, but Solona is neglected. It was once a flourishing city, but on that account it suffered. PAUSANIAS speaks of a temple to MINERVA, of which no remains have been discovered. The largest mosaic pavement in Greece has survived in Solona, and it suggests that the origin of the art was likely to be in Greece. Chryso or Chrysa, which lies between Solona and the sea, was at one time a small republic, and its suppression had consequences which eventually led to the conquest of Greece by PHILIP of Macedon.

ILLUSTRATIONS.

LONDON CITY AND MIDLAND BANK, & CO. BROAD COURT, W.C.

THIS building, together with the adjoining block of offices and flats, forms part of the Bedford estate. Messrs. HOWARD & Co. were the builders, the materials employed being Portland stone and Fareham red bricks.

It will be noticed that there is a heavy dentil cornice, and over some of the doorways is a big shell hood that has been much copied in London. The windows are not set back but are flush with the brickwork. The bank is of fireproof construction throughout. The whole block was completed within twelve months. The architect is Mr. R. SELDEN WORNUM.

OFFICES OF NORTH-EASTERN RAILWAY COMPANY, MIDDLESBOROUGH.

THE North-Eastern Railway Company have lately erected a block of offices in Middlesbrough for the housing of the staff engaged in the supervision of the northern division of the railway and in the management of their extensive docks.

A convenient site closely adjoining both the railway and the docks was obtained by clearing a block of cottages forming the acute angle at the corner of Dock Street and Grey Street, upon which the company erected a building four storeys in height, the ground floor being raised about 3 feet above the street level.

The ground floor consists of a large and handsome room used for meetings and interviews, two offices arranged en suite for the docks department—one for estate work, and one for the district superintendent of the railway. The first floor contains five rooms for the district superintendent, and two for the use of the engineer to the docks. The second floor consists of suites of offices which may be used for the future extension of any of the departments, or for letting to independent tenants. The third floor is arranged into rooms for storage or lumber. A room is specially provided on the ground floor for the range of telephones used in the several departments. The main entrance doorway is from Dock Street and is about the centre of the façade; the vestibule is about 9 feet wide, and gives access to the main staircase, and the corridors, which run the whole length of the building on each floor, are about 8 feet in width. The main entrance doors and the vestibule screen are of polished oak. The flooring of the entrance and the corridors is of concrete, faced with cement. The staircase is constructed of stone, with handsome metal balustrade, hard wood polished hand-rails. The rooms and corridors throughout are lofty and well-lighted, the windows being fitted with ventilating sashes. The warming is by "Well" fires of neat design, constructed in glazed brickwork. The walls of the entrance and corridors have dados of glazed brickwork with bases and strings of excellently manufactured faience supplied from the Burmantofts works at Leeds. The upper parts of the walls are finished in washable distemper. Ample and well arranged and ventilated sanitary accommodation is provided on each floor, the fittings being supplied by Messrs. DOULTON, of Lambeth. The building is lighted throughout by electricity supplied from the generating station of the Company, the work having been carried out by Messrs. GRAHAM BROS., of Middlesbrough. The lavatories have Bunsen gas-burners as a provision against frost in severe weather.

The furnishing is by the North of England School Furnishing Co., of Darlington.

The building is of brick and terra-cotta throughout, from the works of the Burmantofts Company, Ltd. The front is of a rich red colour and of handsome and pleasing design, broken by moulded cornices, deeply recessed door, window and other openings, with flanking pilasters having moulded caps and bases, and with an octagonal bay window having a low bell-shaped roof at the acute angle at the junction of the streets. It will be observed that the material has been admirably adapted to suit the design in this case, as in many others which we have already illustrated.

The design of the building was prepared by Mr. WM. BELL, the architect to the North-Eastern Railway Company; and the contractor for the whole of the work was Mr. H. BARRY, of Scarborough.

ADAPTED COPY OF HAMPTON COURT GATE.

WE have already referred to the reproduction of the famous gates by Messrs. HART, SON, PEARD & CO. It will be seen from the illustration that the new work is at least equal to the old, and sustains the reputation of the firm.

CATHEDRAL SERIES.—WORCESTER: THE WEST DOOR. THE NORTH PORCH.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

Mr. BANISTER F. FLETCHER read the following paper, which was illustrated by lantern views.

Andrea Palladio: His Life and Work.

Of the early life and parentage of Andrea Palladio there exists but little information. All his biographers, with the exception of Paolo Gualdo, describe him as having been born in the year 1518. The latter, however, informs us that he was born in 1508, thus making him just ten years older; but, unfortunately, there is no further confirmation of this statement. Palladio's father, was a mason at Vicenza, where he died in 1545. Though we should much like to know some of the circumstances of his boyhood and the various influences and episodes which contributed to his success in after years, all we are privileged to learn is from Palladio himself, for he tells us that he early possessed a great love and natural inclination for architecture, and that as a boy he read Cæsar's "Commentaries," and imagined and designed the bridge over the Rhine from Cæsar's written description, afterwards utilising this over the Bacchiglione, near Vicenza.

Gualdo mentions that Palladio also seriously studied mathematics, which he considered an essential part of an architect's education. His humble birth is corroborated by Leoni, who describes him as of "mean extraction," adding, "that in consideration of his great abilities, and as a reward for the honours he did his native city, he was made free of same, and received into the body of the nobility." But this honour only came to Palladio when his fame was established throughout the whole of Northern Italy. It is evident that his early life was a studious one, and we naturally infer that a most excellent education was conferred upon him by his father, the mason Pietro, who, in all probability, sacrificed much to secure his son's future. The latter appears to have soon deserted sculpture for architecture, meanwhile also studying the works of Vitruvius, Alberti, Michelozzi, Cronaca, Serlio and San Gallo.

In accordance with the custom of the times, Palladio possessed a patron in Gian Giorgio Trissino. It was with this patron that he first visited Rome in 1541, when he was thirty-three years of age. He must have been exceedingly industrious during this visit, as his drawings of the Classic buildings in his treatise testify. He visited at various periods Ancona, Rimini, Naples, Capua, Pola in Istria and Nîmes. In May 1547, we also hear of his visiting Tivoli, Palestrina, Porto and Albano, returning to Vicenza in July, and taking with him nine books entitled "L'Italia liberata dai Goti." In 1551 he is for the third time in Rome, "in the company of Venetian gentlemen."

His time there was spent in earnest researches among the ruins of her temples and edifices; a time of hard labour, of measuring minutely, and theorising, the results of which he has handed down to posterity in his valuable writings on architecture. He says:—"I began, with the utmost accuracy, to measure every minute part by itself, and, indeed, I became so scrupulous an examiner of them, not discovering that anything of this kind is performed without the justest reason and the finest proportion, that I afterwards, not once but very often, took journeys to several parts of Italy, and even out of it, that I might be able from such fragments to comprehend what the whole must needs have been, and to make draughts accordingly. I thought this an undertaking worthy of a man who considers that he was not born for himself only, but likewise for the good of others."

During his stay in the ancient city no doubt he came often in contact with many of the great artists of the day. Here he could gaze upon the great achievements of Bramante, such as the Cancellaria and Giraud palaces, and the little Temple of St. Pietro in Montorio, and upon the works of Raphael, who died in 1520. He could study the progress of the cupola of St. Peter under the masterly direction of Michel Angelo, and see this great master's work on the Palazzi dei Conservatori in the Capitol. The work of Baldassare Peruzzi at the Palazzo Farnese, and of Antonio San Gallo at the Farnese Palace were also completed at the time of his first visit to Rome.

In Palladio's writings we find interesting information re-

garding the architects and painters of his day. Especially does he eulogise Vasari, whom he styles "a painter and architect of great merit." We also find mention made of Sansovino, who died in 1570, accompanied by much praise of the buildings erected by him. Other contemporaries are mentioned, amongst these being San Micheli, the great military architect of the Renaissance, whose special work is evidenced in his fortresses and palaces at Verona.

We have no information regarding Palladio's marriage, neither do we find any mention made of his wife. He had a family of four sons and one daughter. The eldest son, Marc Antonio, became a sculptor, like his father; we find him living at Venice in 1588, and he died in 1600. Leonidas, who assisted his father, died about 1574. We read of his directing the building of the dome at Montagnana in 1566. Orazio, the third son, studied law in Padua in 1564 and died in 1574. Silla, the youngest, was an architect, and assisted by Scamozzi, completed the Teatro Olimpico, upon which his father was engaged at the time of his death, and died about 1627. Zenobia married Della Fede, a goldsmith, whose name appears inscribed in the guild at Vicenza.

Before the year 1564 Palladio was in legal documents called "of Vicenza" and "inhabitant of Vicenza." In those relating to the marriage of his daughter he appears as "civis Vicentine," a distinction worthy of mentioning in the days of the Republic.

None of the honours conferred upon Palladio can exceed the publication of his works, which was undertaken with much courage and diligence by Ottavio Bertotti Scamozzi, who measured, drew and restored his buildings. This book contains most interesting engravings and commentaries, showing much learning and scholarship. It embraces four large volumes, of which many editions have appeared both in Italian and French. Though infirm for a long time, Palladio nevertheless continued to take an active part in the building of his edifices, and when finally the end came it found him at work upon one of his finest efforts, the Teatro Olimpico, finished after his death by his son Silla and Vincenzio Scamozzi.

Palladio's death was a great grief and loss to his loyal native city, which revered him not only for his genius, but for his many other virtues—for he was both amiable and benevolent, and beloved by his workmen.

Principles.—His principles are best exemplified in his buildings, but a striking point about many of them lies in the fact that he was not slavishly bound by his own rules as to the proportions of the Classical columns and their entablatures. Like many another, he was an exemplar of the saying that a genius can be above rules. Although he refers in detail to the various parts of a building and their proportions, he has left no information as to the design and composition of structures as a whole. It has been held that he was specially in favour of obtaining size and dignity in his composition by including two storeys of his façades within one order. This has been said to have influenced English architecture in contrast with the precepts of Vignola which were followed in France; but Palladio employed both methods equally, while he was also fond of marking his ground storey with rusticated blocks of masonry, expressing his first floor (*piano nobile*) by an order, and his upper (or attic) storey by flat pilasters. He also employed the attic storey, seldom used by other masters, in lieu of a great crowning cornice.

His style has been defined as a mean between the severe use of ancient forms and the licentious style of those who reject all rule whatever. Speaking generally, the plans of his buildings were suitable to the requirements of the Venetian nobility for whom they were erected. The fact that they are not well suited to our present requirements cannot detract from their stateliness and convenience when considered in relation to the age in which they were erected and the climate of Italy. The disposition and proportion of his apartments in regard to each other are often exceedingly happy and effective. Some have found fault with the magnificence and display which are observed in some of Palladio's façades, but here, again, we must remember for whom and for what purpose they were built. His clients were Venetian noblemen, eager to display their power and position by the erection of grandiose buildings, which he provided in his spacious columned vestibules, grand staircases, galleries, libraries and colonnades.

His architecture was essentially columnar and not fenestral, and his entablatures were proportioned to the column with which they were associated, whereas his predecessor, Sansovino, occasionally employed an entablature disproportionate to the columns, as at St. Mark's Library, in which windows are placed in a deep frieze.

Columns were sometimes placed on pedestals in order to give additional height, sometimes not so. The pedestals never seem to have been decorated with panels, sunk or raised, although this feature is so treated in Palladio's book. Fluting is generally omitted from the columns, and this was probably due to the fact that they were frequently formed of brick and stucco, materials which were unsuitable for fluting in long lengths.

Palladio's knowledge of the details of ancient Roman architecture was extraordinary, yet his inventive genius was considerable, and we seldom find that he repeated any of his designs. On the contrary, his façades abound with various dispositions of the orders, in addition to which he obtained effect and contrast by the judicious use of plain and rusticated walling and the use of arcades. His rustication is often excellent in design and scale, and gives considerable character to his buildings, not in an excessive way, as at Florence, but as a set-off to his columns and their entablatures. In the design of his arcades he appears to have preferred the larger order embracing two storeys, with small pilasters placed behind them to carry the floor of the upper gallery. In these arcades, semicircular arches usually rest on piers in conjunction with a trabeated arrangement adopted from ancient baths. A favourite arrangement (of the basilica), however, was one in which he divided the interval between two piers in three parts by small piers, or columns, with an arch only covering the central aperture, a combination which seems to have been copied from some colonnades at Diocletian's palace at Spalato.

In the design of his doors, windows and niches, simplicity seems generally to have been sought after. Fewness in number and largeness in size was his aim. The openings were generally crowned by pediments, alternately angular and circular; but these were never broken—a rococo feature in which he did not indulge. On these pedimented openings he occasionally placed reclining sculptured figures, probably copied from Sansovino or Michel Angelo.

The entablatures to his orders are generally unbroken, but happy effects are sometimes obtained, as at the basilica at Vicenza, by projecting the columns beyond the main face of the wall and breaking the entablature around these projections. In the profile of mouldings he was specially careful; the architraves and friezes were generally plain, the latter being sometimes pulvinated, and his cornices have the consoles and other ornaments carefully centred over each other. Interior decoration seems to have been somewhat neglected, owing, no doubt, to want of funds.

Public Buildings.—The arcades surrounding the three sides of the Gothic Consiglio or Town Hall at Vicenza (also known as the Basilica or Palazzo della Ragione) are probably the most important of Palladio's works. Riccio in 1496, Spaventa in 1498, Sansovino in 1538, Serlio in 1539, and Giulio Romano in 1542 were all engaged at various times on the faulty Gothic arcades of the original structure. Finally, fresh designs were prepared by various architects and were submitted to the vote.

Three were chosen, one each by Spaventa, Giulio Romano and Palladio, with the result that the latter's design was finally adopted by ninety-nine votes against seventeen. It was commenced in 1550 and completed in 1614. It was constructed in stone brought from Piovene, and this stone has weathered in a remarkable manner, and gives to the building a beauty which Palladio's stucco designs do not possess and will never attain. It is curious that he says very little about the basilica himself, except that "there is another of them in Vicenza, of which alone I have given the draughts, because the porticoes around it are my own invention, and I make no doubt but that this edifice may be compared to the ancient fabrics, and to be reckoned among the noblest and most beautiful buildings erected since the time of the ancients, as well on account of its largeness and ornament as of its matter, which is all hewn stone, extremely hard, joined and bound together with the utmost care."

The hall around which the arcades are arranged is 171 feet long by 68 feet wide. It has a semicircular roof covered with lead, hipped at each end. The ground storey supports an upper one by means of vaulting, the upper storey to the roof being about 70 feet. By referring to the plan we see at once that the width of the arcade bays is determined by that of the piers of the Gothic hall which they surround, these piers dividing the interior of the ground storey into seven compartments in length and three in width. With these measurements (height and width), which could not be departed from, it is easy to see that Palladio had to decide on a design controlled and influenced by these data. He marked each storey by an order, the Doric to the ground storey and the Ionic to the upper one, these being formed as half columns backing on to a wall of

considerable thickness, and their entablature returned back to this wall at each column, thus giving a vertical expression and preventing the squat proportion which would have resulted had the cornices been continued round the façade without a break.

Furthermore, the height of the ground floor arches on the façade had to be considerably less than the hall, because the entablature of the order occupied some depth, and the arcade had to be beneath this. A statue crowns the balustrade over each pair of columns, and thus an unusual and difficult proportion of bay was cleverly handled. It is in the design of the space between the principal columns that the beauty and originality of this building is found. A space approximating a square is contained between the main columns as vertical lines, and the base of these columns and the underside of their entablatures as horizontal bounding lines. It is particularly in his treatment of these that Palladio has shown his skill, and produced a *motif* which to this day is known by his name. He has filled in this square space with four columns, placed in couples about 3 feet 6 inches from the main piers, and supporting a cornice from which springs a semicircular arch covering an opening twice its width in height. In the spandrels are circular openings.

The treatment of the angles of this building also shows the master hand. Here he was without restrictions as to width, and he has decreased this by placing the coupled secondary columns nearer to the piers, and by doubling the main columns at the angles, or, rather, by placing an extra angular three-quarter column which shows on each face. This diminution of width of bay and the doubling of the columns give an appearance of strength to the angles of the façade which is very pleasing. The basilica is such an important creation that a few words as to its detailed proportion may not be out of place.

The order to the lower storey is Doric, consisting of half-columns about 2 feet 8 inches in diameter, attached to a wall about 4 feet 4 inches thick. The columns are about eight diameters, and the entablature is slightly over a quarter of the column in height. The smaller Doric free-standing columns to this storey have the same proportion as the larger, but they have a circular base, no doubt with the intention of preventing inconvenience to pedestrians. These small columns have a cornice, in height about one-eighth that of the columns, of the type shown, and from this springs the semicircular arch.

The upper storey is ornamented with a large and small Ionic order, both placed on the same continuous pedestal about a quarter of the height of the larger columns, these latter being 2 feet 3 inches in diameter and 8½ diameters in height. Palladio has not here followed his own rules nor those of Vitruvius, who says "that when the columns are placed over each other the upper one should be a quarter less in diameter than the lower," whereas in this case it is only one-sixth. A balustrade one-fifth of the Ionic order in height crowns the façade. The height of the Ionic entablature is about one-fifth of the height of its column. The smaller free-standing columns of this order are 1 foot 2½ inches in diameter and 8 diameters in height. The capitals are of the Grecian type, and have circular plinths and cornice similar to that on the lower storey. This building must rank as Palladio's masterpiece; the peculiar charm it now possesses is also much enhanced by the beautiful weathering of the stone.

The Teatro Olimpico at Vicenza is a good example of Palladio's skill in planning. In this building he was not in any way bound by precedent, as suggested by some who have only studied his work superficially. On the contrary, he well knew how to accommodate the principles of Classic architecture to the special circumstances of his own designs, modifying according to need the proportions, forms and distribution of the parts.

Palladio's studies in Rome among the Classic ruins, and also his excavations of the Berga Theatre at Vicenza must have well equipped him for designing this building. He also had made a special study of Vitruvius and the elaborate directions laid down by that author indicating how the ancients planned these particular buildings. When, therefore, the Academy of Vicenza decided on constructing a building in which plays of the Classic authors might be given, it was to Palladio, whom they regarded as a high authority on the subject, that they naturally turned. The work was begun on May 23, 1580, in Palladio's presence, but he was not destined to see its completion, for he died on August 19 of the same year. In gratitude for his work we are told that the Olympic Academy nominated his son Silla to superintend the work. The theatre was not entirely completed till 1584.

The plan and general distribution leave no doubt that Palladio kept the form of the Roman theatre in view, but that, owing to the peculiar and restricted shape of the site, variations had to be made, the most notable being the semielliptical auditorium, which takes the place of the semicircular plan of the Romans. Scamozzi has been at some pains to inquire into the general principles of proportion adopted, in which, owing

to the novelty of the elliptical plan, he had to depart from the proportions of Vitruvius. His remarks are certainly ingenious and convincing, but cannot receive a detailed notice here. The building proper occupies a site 123 feet long by 75 feet wide. It will thus be seen that the space originally at disposal does not include all that shown in the plan, but only the auditorium and the stage. The extra accommodation, including the three rooms to the left and the portions behind the permanent scene, were acquired afterwards.

The elliptic form, or rather that produced by portions of three circles, was decided upon as being most economical for the seating of an audience desirous of hearing and of seeing perfectly. The length of the scene is about 70 feet. It is constructed in stone and is composed of two orders of Corinthian columns placed one over the other. The upper columns are not isolated like those below, but are semicircular in plan and attached to the wall. Their pedestals project over the lower columns and support statues, forming a very pleasing feature.

Above the upper order of Corinthian half-columns is an attic storey with small pilasters over the axes of the lower columns. In front are placed statues, while between them are square panels filled with sculptures representing the labours of Hercules executed by well-known sculptors. Between the columns of the ground and first storeys are placed niches occupied by statues and framed in with pilasters, entablature and pediments, triangular or segmental. The centre of the scene has a large open archway of semicircular form, springing from the cornice of the lower storey, and there are smaller square-headed doorways on either side, formed under the entablature of the ground storey.

The return walls of the scene, which are at right angles to it, are treated in a somewhat similar manner to the front. On the ground floor is placed a doorway centrally to each return, having on each side a semicircular-headed niche, above which are slightly sunk panels filled with bas-reliefs. The first door has a central opening, protected by a balustrade. Above the podium or enclosing wall of the auditorium are constructed the seats in thirteen tiers. They are about 21 inches in width and 15½ inches in height. Above the top row of seats is placed a Corinthian colonnade, cleverly contrived to hide the irregularities of the site.

The openings of the permanent scene, central and side, form entrances to the interior scene constructed as streets radiating therefrom. These streets are built in perspective, with buildings on either side, the line of sight or horizontal line being half-way between the stage level and the upper tier of seats of the auditorium. This construction in perspective was designed by the architect Scamozzi. The ceiling is flat, and extends without interruption over auditorium and stage, allowing the voice to travel without hindrance.

Town Houses.—Some of Palladio's most important designs were erected in his native town of Vicenza. They were mostly built in brick faced with stucco, which has now fallen away, and in consequence the designs suffer from having been executed in such poor materials. Palladio has been blamed for this by certain critics, who evidently consider that he was responsible for the depth of his client's purse. We should rather rejoice that, in spite of the materials at his command, he should have been able to produce such excellent results.

Palladio introduces the subject of town houses as follows. He says:—"I am sure that they who shall look upon the buildings I am going to give the draughts of in this book, and they who know how hard it is to introduce a new way, particularly in the art of building (in which every one presumes to be knowing) will think me very happy that I have met with persons who were generous, judicious and reasonable enough to hear and approve my reasons." The Palazzo Chiericati has a great gallery or portico, which extends the whole length of the principal front on the ground floor, and is carried up on the two wings to the first floor, the central portion of which is walled in, forming the hall. The front of this building has two orders, the Doric for the ground floor, the Ionic or the first floor, and is an example of treatment which Palladio often favoured. This is to be remarked, because his name is generally associated with the treatment of an order embracing two storeys in height.

In Leoni's edition of Palladio's "Architecture" this building is shown with the Ionic order of the central portion of the first floor as pilasters, instead of half-columns, but most will agree that the substitution of pilasters would have deprived the façade of much of its interest. Another feature is the continuous pedestal, or stylobate, upon which the lower order rests, forming a solid base or support to the whole structure. The Doric columns are of sturdier proportions than usually adopted by Palladio, being 7½ diameters in height. This sturdy proportion was probably used because these free-standing columns supported an upper storey, the central portion of which was solid. These and other deviations from the master's own precepts are interesting as showing how he altered them to suit the circumstances of the case. The upper storey is treated with the Ionic order, resting on pedestals

which have no base. Although a large part of the building appears to have been erected during his lifetime, it was only finished a considerable time after his death, viz. towards 1700.

The Palazzo Tiene, like so many of the designs, was only partly finished. It consisted of a central square courtyard of 84 feet 6 inches, surrounded by a rusticated arcade, beyond which are the various rooms, the size of the whole site being 190 feet by 176 feet. The windows to the first floor have small three-quarter Ionic columns with entablature and pediment. This is an excellent composition, the reserved use of the order for one storey only being very happy. These first-floor windows have rusticated shafts resting on pedestals, between which are placed balusters, a composition probably designed to lead by an intermediate stage from the masculine treatment of the basement. In Leoni's drawing the main entablature is shown at about one-fifth of the height of the column, which is Palladio's usual proportion, whereas in execution it has been increased to one-fourth its height, our architect evidently taking account of the narrowness of the streets and the consequent foreshortening of the upper mouldings. The courtyard is equally fortunate, a similar treatment being adopted, except that the necessary openings are left for the arcading between the piers. The attic has also small windows lighting the rooms of the upper storey. The finished portion was adorned with sculpture by Alessandro Vittoria, Bartolomeo Ridolfi, and with paintings by Anselmo Canera and Bernardino India, both the latter being of Verona.

The Palazzo Valmarana was erected by the Conti Valmarana, as Palladio says, "not only for their own honour and convenience, but also for the ornament and glory of their country," an idea which might be more often followed by rich men in these days. The house is divided into two parts by a central court, and behind is shown a large garden, 120 feet by 68 feet 6 inches wide. Only the front block of this important façade has been executed. The stables are also placed in rear of the site. The ground-floor apartments are vaulted and the upper ones ceiled at a height equal to their breadth. It is curious to observe that in Leoni's edition the site of this building is shown as rectangular on plan, whereas in reality the front wall is not at right angles to the side walls. There were two ways of treating this façade, viz. either to make the front wall at right angles to the side walls, in which case it would have to be set back from the general line of the other buildings in the street, or, as Palladio arranged it, of making it line up with the general building frontage, allowance being made for the difference of shape in the front rooms. In choosing the latter arrangement Palladio showed his good taste and left it as a legacy for architects of all time. Many modern buildings have been spoilt by neglecting to adopt this principle in dealing with awkwardly shaped sites. The method of stepping-back the façade in order to make rooms square is very unsatisfactory, and has only to be seen to be at once condemned. The façade of the Valmarana Palace has been the subject of much criticism. It shows another treatment, having an order of Composite pilasters embracing two storeys in height and an attic storey over them.

The façade above the base is in brick and stucco. The main entablature is one-fifth the height of the column, and the order rests upon projecting rusticated pedestals, one-quarter of the height of the pilasters. The secondary order of the Corinthian type, which marks the ground floor, rests upon the same pedestal as the larger order, an arrangement which many critics have condemned. This order is of half pilasters backed against the main order, and is not a happy arrangement. The entablature to this order is broken at each intercolumniation against the main pilasters. Above the main entablature is an attic the height of which is one-quarter that of the pilasters. The upper windows have balconies of small projection. It will be seen that the main pilasters do not terminate the façade in a manner which might be expected, the secondary order being doubled instead and made to support statues above its cornice. As a principle of design this does not appear correct, the length of the façade being thereby apparently diminished, and the framing of the whole design unpleasantly affected.

The Palazzo Barbarano is interesting in many ways, because Palladio has given his original design and also that which was actually carried out. It has an entrance leading to a large columned hall beyond which is an open court. As to the façade each storey has its own order, whereas in the original design one Corinthian order of semi-columns resting on a podium was taken through two storeys. There is no doubt that the second or executed design is immeasurably superior. On the ground floor the wall space between the Ionic half columns is rusticated, and the windows have flat arches, the abundance of wall space giving the necessary strength which a ground storey should possess. Exception might be taken to the impost moulding upon which these arches rest as being unnecessary. The upper storey is in a most ornate manner. The windows have architraves and consoles supporting pediments, alternately triangular and segmental, upon which are placed reclining figures. The

podium to these windows is pierced with a balustrade, while the Corinthian columns are unfluted and rest upon a continuous block immediately over the cornice of the lower order. An attic plainly treated with square window crowns the whole building. The angle treatment of the Ionic order is peculiar. Although built in brick and stucco, this palace must always remain a triumph of art over matter. The meanness of the material used is completely lost sight of in the superior excellence of a master design. In execution this has been considerably altered. The original design was for a regular façade of seven bays with a central opening leading into a columned vestibule. Additional land appears to have been acquired, which throws the principal entrance out of the centre. The Ionic columns to the front façade have a height of 9 diameters, those of the courtyard at the back $9\frac{1}{2}$ diameters, and those to the entrance $8\frac{1}{2}$ diameters, these latter having to support a solid vault. Palladio herein followed Vitruvius, as the latter mentions in his Book I., chapter 2, "that variations may well be made from the regular proportions in order to suit them to special circumstances." The Corinthian columns to the first floor are also raised upon a plinth in order to prevent their bases being hidden by the projecting cornice of the lower order.

The Palazzo Porti faces two streets, and the front portion only was executed. The entrances from each street led through columned halls to a great central courtyard, open to the sky, and surrounded by a colonnade of Composite columns embracing two storeys in height, and crowned with entablature and balustrade. The passage on the first floor is supported on pilasters attached to the backs of these tall Composite columns.

Palladio mentions Paul Veronese as the artist employed to paint portions of the interior. The exterior is certainly one of the most pleasing, and resembles that already shown in the Palazzo Tiene. A rusticated basement with square-headed windows and circular relieving arches with carved keystones supports a *piano nobile* of attached Ionic columns and entablature. Between the columns are square-headed windows surrounded by an architrave moulding, and provided with consoles carrying pediments alternately segmental and triangular. Over these pediments Palladio designed reclining figures, but only three groups are really executed, a central and two angle ones. This omission helps the façade, which might otherwise appear too complex and crowded. There is also another important difference between Palladio's design and that which was actually carried out. In the statues which decorate the attic storey he shows a range of eight, resting on the top of the attic pilasters, whereas there are only four, and they are placed immediately above the cornice in front of the pilasters. This appears an infinitely better position, for there is something dangerous looking and gymnastic about free-standing sculpture at a great height from the ground.

The Palazzo del Consiglio, also known as the Palazzo del Capitano; the Prefetizzio, Municipio, Loggia Bernarda and Palazzo Comunale, is not mentioned in Palladio's book, and must therefore have been erected after its publication. It is comparatively a small building, a portion only of the original design, and is situated opposite his masterpiece in the Piazza de' Signori. Thus we can see at a glance one of his earliest and latest productions. The Composite half-columns, without pedestals, are carried through two storeys and their entablature breaks round them, and is crowned by a balustrade. The attic storey over is set well back and does not interfere with the general proportions of the façade, which are excellent. The lower portion forms a triple arcade, and the upper storey has windows and projecting balconies supported on triglyph brackets. The windows of this storey cut into the architrave of the main entablature, a defect in the design which is hidden by the outside blinds. The view shows the dilapidated condition of this façade, the brickwork of the columns showing where the plaster has fallen off. The treatment of the side façade differs from the front, the main order not being carried round, and is not successful. The Casa del Diavolo, also known as the "Antica Posta," the "Casa Porto" and other names, is an unfinished design. Two bays only of the façade have been completed, which indicate the immense scale adopted. Half-columns of the Composite order rest on deep pedestals, the cornice of which forms the impost of the principal gateway. These columns are 10 diameters in height, and from their abaci sculptured festoons, bound with oak leaves, stretch from one capital to another. The windows to the first storey are crowned with pediments, alternately segmental and triangular, and have projecting balconies with balustrades supported by consoles. The entablature of the main order has windows in the frieze, in the manner of Peruzzi, to give light to the small rooms of the upper storey.

The House of Palladio was erected in 1556. There appears to be no evidence that Palladio ever resided in it. At the same time, as an instance of one of his smaller works, which he might have designed for himself, it is an exceedingly interesting piece of work. The plan consists of a front and back *corps de logis*,

with an open area between, to the side of which is the staircase. The ground storey has Ionic columns with entablature one-fifth of their height. A large centre semicircular headed opening forms the chief entrance, and has reclining figures in the spandrels. Smaller flat-headed openings are on either side. The first storey has Corinthian pilasters of a rather stumpy proportion, and above is an attic storey crowned with a modillion cornice. The blank space in the centre of the first storey is probably caused by the fact that the light for this room is obtained mostly from the interior court.

(To be concluded.)

CRANNOG OR FISHBOTHY?

IN 1898 a curious wooden structure, with outer layers of piles, was found, writes Mr. R. Munro, B.D., in the *Glasgow Herald*, on the margin of the river Clyde, near Dumbuck. Its discoverers at once called it a crannog; and since then they have not only stuck to the name but they have, by pen and pencil, and in every possible way, sought to magnify its importance and extend its reputation. At first it was assumed to be a crannog of the ordinary kind, directly related to its humbler kin of the Scottish type, whose genealogy does not go beyond the Middle Ages. But gradually as things began to be found in it—odd things of bone and shale, stone and shell—the discoverers claimed for their crannog a pedigree more ancient than any in the land, or, perhaps, in any land. The Dumbuck crannog was no common crannog, but a genuine product of Neolithic, or even, it might be, of Palæolithic times. Then came the experts with their prosaic objections and critical scepticisms. Dr. Munro, the European authority on crannogs, declared that the famous structure was not a crannog at all, but the foundation of a stone building or cairn; and that, whatever it was, its date was post-Roman. He, and others also, raised perplexing questions as to the character of the relics. They were entirely unlike anything hitherto discovered in the Neolithic areas of Europe. Their type was puerile; and, as they were not formed of flint or stone, they could have been neither the weapons nor the implements of veritable Neolithic man. Besides, many of the finds got in the Dumbuck site were of such a kind, both as to form and character, that there could not be any reasonable doubt that they belonged to recent or historic times.

These objections—cold and unsympathetic—made things pretty bad for the Clyde crannog, and ultimately all competent archaeologists came to regard it as a Mediæval structure of some sort. It was a sad disillusionment. A lengthy drop from the far-off Palæolithic and Neolithic times to the Iron Age of yesterday, with its axes and hammers and saws and dry facts. Consequently other last and frantic efforts were made to save the character of the crannog from utter collapse by representing it as a site for the manufacture of totems and curios in shale and shell—which might belong to any age—or in suggesting that it was a Roman centre, and that the relics, the carvings and such like were the work of the Imperial soldiers as they wiled away the *ennui* of an idle hour. This last suggestion was evidently not intended to be taken seriously, for it was not backed by any evidence to show that this was a favourite pastime of the Roman soldier in his spare moments, and that he has left elsewhere behind him remains of an analogous or similar type.

Such shortly, and I trust without undue bias, is the history of the Dumbuck crannog down to date.

Is there any rational explanation of the structure that has created for itself such a name and stir in the archaeological world? That it is not a crannog, and that it is not Neolithic may be taken as proved. What, then, is it?

Some facts that I have incidentally lighted upon will, I am hopeful, help to answer that seemingly insoluble question. In the summer months of 1901, while studying the Paisley Abbey charters for the purpose of finding out the old forms of Dumbartonshire place-names, I came upon many interesting references relating to fisheries and fishing rights and customs. The oldest reference of this kind is a charter granted by Walter, son of Alan, first of the Stewards of Scotland and founder of the Paisley Monastery. About 1165 he gave the monastery, among other rights and possessions, "the whole of the island near his town of Renfrew, along with the fishing between that island and Partick, and the use of one net for catching salmon." In the same charter it is further stated that he assigned to the monks "the entire salt-work—*totam salinam*—in Kalenter (Calder (?), Lochwinnoch) which formerly belonged to Herbert, the chamberlain." "Registrum de Passelet," p. 6. When Alan, son of the said Walter, granted to the Paisley monks, in 1202, the lands of Moniabroc in Stragrif, or ancient barony of Renfrew, it is provided that they be entitled to fish Lochwinnoch, and to make and to have half of the fishing at the mouth of the loch. "Reg. de Pass.," p. 14. About eighty years later the two fishings at the exit of the loch are called

spectively the Yair of Auchindunan, which belonged to the Meschal's family, and the Yair of Lyncleyft, which belonged to the monastery. "Reg. de Pass.," p. 254.

Others who richly endowed the monks of Paisley were the great Earls of Lennox. They gave them not only the church of Kilpatrick, but the lands of Cochinach, Edinbernan, Baccan, Melach, Drumcrene, Losset, Drumthoker, Drumteghlan, Cumdianis, Cultebut, Reinfode, Monachkenran and Dalmonach. Interesting as it might be to dwell on these old times of the lands of Lennox, it is not, however, with them that we are now concerned, but with the fishing rights that were conceded along with them. The first charter of this kind was granted in 1224 in favour of the monks of Paisley by Alexander I., Earl of Lennox. "Carta piscarie ad unum rete in Leven." "Reg. de Pass.," p. 213. This charter gave the monks the right of having a net in the river Leven, and secured them and their servants of the Earl's protection in making it. In the confirmation of this grant by Alexander II., the donation is described as that of making one yair over the river from both sides of the water ("de uno yar super amnem Leven ex utraque parte amnis faciendo"). "Reg. de Pass.," p. 214. Robert Hertford, a Glasgow priest or precentor, further increased these piscatorial privileges by gifting to the monks in 1225 his fishing and yair on the east side of Lynbren Leven water—along with an acre of ground near the river, in the land of Seneglass, between Lochan and Crakan. "Reg. de Pass.," pp. 211-13. In the same year Maldoven confirmed all these rights and privileges, and made additional concessions. He gave them the lands of Dallenlenrath (Dalmonach is the form of the Cartularium Comitatus de Levenax, Carta, 11), "which lies between the said fishing and the highway towards Dunbertan." This charter conferred the right to fish with yairs from both sides of the Leven and across the water as they pleased. It gave them pasturage for eight cows and two horses in his lands of Buchlul (Bonhill), with liberty of taking and using the same and wood for building purposes and firewood from his lands and forests wherever they found it most convenient. It gave them permission "to fish his lake of Leven Lomond in its whole extent, without restriction, with the liberty of drying their nets and of building houses and dwellings for their fishermen, as well in the island of the said lake as in his adjacent lands" "cum libertate siccandi retia sua siccandi domos et scalingas piscatoribus suis tam in insulis quam in lacus quam in terris meis circumjacentibus." "Reg. de Pass.," p. 212. This important charter is witnessed at Paisley by Walter, the second Steward of Scotland; Radulf, chaplain of the king (who at one time held the pasture land of Backan Kilpatrick and Hillington in Renfrew); Malcolm and Robert, brothers of Maldoven; Robert Mundgumry (Eglinton); Alan de Insula (Alan Lyle, baron of Duchal—ancestor of Robert, created Lord Lyle in 1445); Roger, son of Robert; Galfridus Marssell (or Marshall, Justiciar of Renfrew); Humfry of Kilpatrick (founder of the Colquhoun family). The next charters bearing on our subject are those in connection with the church at Rosneath, which was conceded to the monks of the Paisley Monastery. There are charters, of 1230, given by Amlec and Haul, brothers of Maldoven, which the monks were entitled to fish the whole of the Loch with nets for salmon and other kinds of fish, and to use the lands of Rosneath salt works and their pertinents. "Carta Amelec . . . de donacione saline in Rosneath, et Garper totum." "Reg. de Pass.," p. 210; "Carta Haul . . . de saline in Rosneath." "Reg. de Pass.," p. 211. These were constructed both for making and preserving salt for general use and curing purposes (*vide* "Annals of the Clyde," by George Neilson, LL.D., for a most interesting and detailed chapter on ancient "Salt Works and Fisheries," pp. 1-10). Coming down to later times there is, for our purpose, an important charter, of date 1452, called "Carta piscarie Crukytshot." By this charter Robert, Lord Lyle, granted to the abbots of Paisley and their successors the third part of the fishing ground known as Crookedshot—the fishing ground of Clyde adjoining the lands of Auchentorlie and Dunnerbie. He also gave them "that particular piece of land lying upon and in the neighbourhood of the third part of the fishing ground of Crookedshot for the purpose of erecting a house for the preservation of fish and for the use of the servants of the said abbey and convent, when detained in that place"—"particula terre contigua et vicina prefate tertie partis de Crukytshot, ad construendum unam domum pro conservatione piscium et pro servitoribus in ibi trahentibus dictorum Abbatis et Conventus qui pro fuerint." In addition it is stipulated that they may have a suitable place "for preparing, mending and drying their nets near the fishing ground of Crookedshot, where his own men were formerly wont to mend and dry their nets; with the right of taking wood from the forests of the Auchentorlie and Dunnerbie for the purpose of hanging their nets." "Reg. de Pass.," pp. 250-51. Crookedshot was one of the famous fishing reaches on the

Clyde. It is frequently mentioned in the early charters, especially in the "Registrum Magni Sigilli," "The Protocols" of Glasgow, and "The Retours" of Scotland. It and Spittelshot, another notable fishing, belonged to the 10th land, old extent, of Auchentorlie, Dunnerbie and Spittel. In the parish records of Kilpatrick, date 1750, Bowling is called Bowland of Spittel, so that the fishing of Spittelshot must have been situated in its immediate neighbourhood, possibly between Glenarbut and Ferrydyke. Crookedshot was probably lower down, at a bend of the river that at one time existed to the east of Dunglas and between it and the place where the harbour now is. This bend is shown in Pont's map, drawn about 1620, and published at Amsterdam in "Blau's Atlas" in 1662.

Much as yairs and cruives figure in the early charters and Acts of Parliament, nothing of a very definite or practical kind is known about them. None of the yair sites, as far as I am aware, have been excavated. We must depend, then, on such aid as we have. Dr. Jamieson in his dictionary defines a yair (Eng. *weir*, A.S. *waer*, *wer*, Icel. *vörr*) as "an enclosure, commonly of semicircular form, built of stones or constructed of stakes and wattled work, stretching into a tideway for the purpose of detaining the fish when the tide ebbs." The old "Statistical Account of Scotland," which was written when yairs were in general use, tells us that they were so abundant in the Clyde at Cardross that they seemed to be almost peculiar to that parish; that they were 4 feet high, of considerable length and stretched out into the river in the form of a crescent or three sides of a square, and that herrings were caught in them in large quantities, and salmon in smaller quantities as they ascended during spring (vol. xvii 217-18). From the same source we also learn that in the parish of Alloa yairs were a sort of scaffold projecting into the Forth, upon which the fishermen built little huts to protect them from the weather. At certain seasons of the tide they let down their nets from these scaffolds, and were frequently very successful (*vide* "Stat. Acc. Parish Alloa," vol. xiii. p. 597).

In the reign of Robert I. (1318) a law was passed ordaining "that all who have cruives or fishings or stanks or mills in waters where the sea ebbs and flows, and where young salmon or smolts or fry of other kinds of fish of the sea, or of fresh water ascend and descend, such cruives and the machines placed within them shall be at least of the measure of 2 inches in length and 3 inches broad, so that the fry of the fish may not be impeded" ("Acts of Parl. of Scot.," c. 11, vol. i. p. 469). A curious stipulation is made in one of the Acts, "that the mid-stream be as wide as the length of a three-year-old swine, well fed, so that neither the snout nor the tail of the pig may touch the sides." This Act was passed in 1175, and is, perhaps, the oldest Scottish fishery Act ("Ass. Will" c. 10, "Acts Parl. Scot.," vol. i. p. 374). As late as 1632 King Charles I., taking into consideration that many of his subjects on the bounds of the Firth of Clyde "have been at all tymes heretofore and still are, at some seasons of the year, chiefly maintained by the fishings thereof, grants that none fish between the Mull of Galloway and Kintyre, or in any place within the same, except the natives according to the ancient custome" ("Acts Parl. Scot.," vol. v. p. 245, b.). In the earliest Colquhoun charter, granted by Maldoven to Umfridus de Kilpatrick about 1240, there is mention of the pools, mills and fishing in the lands of Colquhoun, between Dunglas and Dumbuck; and in the charter of King James V., 1541, "the lands and barony of Colquhoun, and the manor place of Dunglas, with the fishings and yairs in the water of Clyde," are particularly indicated. The latest charter connected with "the lands of Milton of Colquhoun and Carcaston, now Dumbuck," is that given by Sir Charles Edmonstone of Duntreath to Lieutenant-General Thomas Geills of Ardmure, where it is stated that these possessions "are to be called in future the lands and estates of Dumbuck, with the fishings, yairs in the river Clyde, &c.," date 1815 (*vide* Charters of Colquhoun and Country of Clan Colquhoun by Sir William Fraser).

Dr. David Murray in an article "On Recent Archaeological Discoveries" published in the *Glasgow Herald*, March 22, 1899, says that at the mouth of the Leven, a short distance below Dumbuck, there is a low cairn of boulders known as the Black Layer, and in the Bay of Ardmure, a few miles further to the west, there are two similar structures, the Big and Little Layer, between high and low-water marks, and tailing towards the shore. Layer is evidently a corruption for yair. The sites of wood and stone in the island of Eriska and in the Beaully Firth—which are not crannogs, and concerning which as yet there is no adequate explanation—may possibly be yair sites ("Proc. S. A. Scot.," vol. xix p. 192). It is almost certain that the large cairn mentioned by Miss MacLagan in her book on "Hill Forts," as existing near the mouth of the river Ness, at high-water mark, and called "Cairnaire," which she translates as "Cairn of the Sea," is the ruins of a yair, and that the correct designation is "Cairn of the Yair."

The above facts are, I think, worthy of being duly con-

sidered as helping to throw light on the structures recently found on the margin of the Clyde. The charters prove that as early as the first quarter of the thirteenth century there were yairs on the Clyde and the Leven, and salinæ at Rosneath and elsewhere. They also show us—and this is the point which is of most importance, and upon which I desire to lay special stress—that at a very early period it was customary to construct on or near the Clyde houses which were a kind of bothy for preserving the fish and for affording shelter and accommodation to the fishermen. They were built of stone and wood taken from the neighbouring lands and forests. They existed not only on the Clyde, but on the Leven and in the islands of Loch Lomond—in fishing grounds belonging to the Paisley monks and in fishing grounds over which they had no control. It would be interesting to know if there is any reference in the early charters elsewhere to fishing bothies of this kind constructed on the margin of tidal rivers. In any case they existed in the district of the Clyde valley as early as 1225, or possibly earlier. And it would be well in the interests of Scottish archaeology if those who are pushing the claims of the so-called crannog to such unreasonable and unscientific lengths would look into this new aspect of the subject in the hope that we may come to some definite conclusion regarding the matter. There is no evidence whatever that the foundation of wood at Dumbuck was a crannog or a Neolithic site; there is evidence which to me at least is almost conclusive that it was the foundation of “a house for the preservation of fish and the accommodation of fishermen” when plying their piscatorial craft. Strangely enough it was suggested by Mr. John Bruce during the *Glasgow Herald* controversy on the subject that the curious well in the centre of the Dumbuck structure was “a fish-tank or pit for the preservation for future use of the surplus catch not immediately consumed.” He was nearer the secret of the Dumbuck littoral site than he dreamed. Drs. Munro and Murray told us long ago that it was the foundation of a stone building or cairn. A cairn it can scarcely have been, as later finds clearly indicate that it was used in some way as a human habitation. What kind of habitation? The site is not exactly one that any kind of man—Neolithic or otherwise—would choose for a house; and as a place of defence it would not only be too small—holding at most a dozen people—but would be absolutely worthless as a stronghold. As a fish bothy, with its central cavity and outer ditch for preserving “the surplus catch,” it would be precisely in its proper place, and would explain all the other inexplicable conditions of the strange structure and its stranger situation.

THE RHIND LECTURES.

THE fourth of the present series of Rhind lectures was delivered by Mr. Thomas Ross in Edinburgh on the 30th ult. The lecturer pointed out, says the *Scotsman*, that in the former lecture it was shown that the building of Edwardian castles came to an end about the close of the thirteenth century. Consequent on the long struggle for independence, and the large sums paid for the ransom of David II., the country was impoverished and unequal to the task of erecting great castles; and further there was the suspicion with which they were regarded by Bruce as likely to afford more assistance to his enemies than to himself; and, with the exception of Tarbet Castle, on Loch Fyne, built by him to overawe the Western Highlands and Islands, most of the fourteenth-century castles were more of the nature of private mansion houses than castles of national importance. On account of the unsettled state of society, however, these had to be places of considerable strength. It was at this period that the Scottish lords reverted back to the Norman keep type of castle, with which many of them were familiar from imprisonment in them during the English wars. These Scottish keeps were oblong on plan, varying from 50 to 80 feet in length by 30 to 40 feet in width, and three or four storeys high. They were superior to the Norman keeps in having vaulted floors as a security against fire, but they had nothing of the elaborate Foss building entrance of the former, nor was that to be expected in castles not manned by regular troops. The domestic accommodation in such a tower was primitive with little privacy. Kitchens in the earlier ones were unknown. The development of these was shown from the small doll's-house-like kitchen of Crichton up to the more stately kitchen in the same castle of a later period. Besides building many new and independent keeps on new sites, keeps were added to almost all the castles of the first period. That process forestalled somewhat the castles of the third period. By a later and similar process the towers of the second period, now under review, were in the third period often added to by the addition of buildings surrounding a courtyard. In either case it would be found that in a large castle where there was a keep it was of earlier or later date than the other parts of the castle, this depending on

which of the foregoing processes it had gone through, unless in such extended castles as Doune and Tantallon, where it was obvious at a glance that the whole was of one date. At the end of the fourteenth century the importance of the castles was as fully recognised as in the time of Edward I. That was seen from the expenditure on their repair and upkeep, and the official reports as to the condition of such castles as Berwick, Roxburgh, Edinburgh, Stirling, Caerlaverock, Lochmaben and others, and from the great quantity of stores constantly flowing into them. And there was the same jealous exclusiveness seen in the command of Edward III. to the keeper of Lochmaben, “No one to be received in the pie beyond the garrison,” and it was with a feeling of relief that a truce was arranged in 1385. “That no fortress is to be built of new, or repaired, in the counties of Northumberland or Cumberland, or those of Berwick, Roxburgh or Dumfries—saving those in progress at this date.” That great watchfulness over important castles appeared more or less all through the Middle Ages, but was more prominent at some periods than at others, and extended to private ones also. No one could build a new castle or fortify an existing house without a license which stipulated what was to be done. The building of these unlicensed castles, “castra adulterina,” as they were called, was illustrated by a petition to the king from the Mayor of Carlisle in 1385, in which he set forth the defective condition of the castle, and complained that “The seigneurs of the country around, who used to repair to the city in war time, have raised castles of their own on account of the weakness of the king's castle.” These licenses were very numerous in England, and many were extant for Scotland, where it appeared that even an iron gate or grated window could not be put without authority. In regard to these it showed a pleasing advance towards millennium times when, in 1605, the Privy Council decreed that “iron yetts (within the late borders) within their houses are to be removed and turned into plough irons or the like.”

In the fifth lecture Mr. Ross explained that the third period of the architecture of Scotland began with the reign of James I. and ended with that of James V., comprising the whole fifteenth century and forty years of the sixteenth. What entitled that period to be regarded as a distinct epoch was that great castles and palaces again began to be built, rivalling in size those of the first period. Linlithgow, Stirling, Edinburgh, Falkland, Doune, Tantallon, Dunfermline, Spynie, Balveny, Rosslyn, Edzell, St. Andrews and many others were all castles or palaces of great size, and were, some of them, built as on undertakings. Others, of which Hermitage and Crichton were examples, were greatly enlarged. These great buildings were more domestic in their arrangements than the first period castles were. Although they were all strong houses, they were not planned on such entirely strategic lines. They were not, like them, divided into parts, each of which besiegers had to win successively, at always increasing risk to themselves, as the garrison got concentrated into narrower spaces. There was an increased appreciation of the refinements of life and manners, when it became impossible on both sides for the lord, the lady and their retainers to live in common in the great hall. That led to an increase of apartments and division of the house, suitable to different degrees. Gunpowder, invented about that time, was first sent to Scotland in 1388, obviously for the munition of Roxburgh Castle, and henceforth they read of the new invention and its belongings, guns and stone balls and barrels of powder being sent for the provision of important castles along with the older arms, such as crossbows and wynders, barrels of bow-strings, with sheaves of arrows. That invention, which ultimately changed the whole art of war and fortification, had an undoubted effect on castle building, leading the nobles to see that it was now useless to attempt building castles to resist long sieges against the new artillery. Also about that time a remarkable group of Churchmen appeared in Scotland—founders of colleges and encouragers of the new learning which was beginning to make itself felt, and as they were all great builders their influence must have been considerable in widening the scope of the conceptions of the amenities of life. But perhaps what gave the greatest impulse to the revival of domestic and castellated architecture was the magnificent patronage given by the Stuart kings at the palace of Linlithgow, Dunfermline, Stirling, Edinburgh Castle at Holyrood, Falkland and other places. Perhaps it was at Linlithgow Palace where the architecture of the period reached its highest level. As it then stood, and it was practically entire, it was begun, carried on and ended by the six Jameses and by them only, so that it might be regarded as the grand memorial which they possessed of the Stuart kings. A castle existed there in the time of Edward I., and evidently a strong one, but of it nothing whatever remained. One of the striking features of the great courtyard castles of that period was that the entrance was below the principal part of the building into the courtyard, from which one reached the various stairs leading to the different parts. That would be observed at Tantallon, Doune, Balveny, St. Andrews, t

stored centre of Dirleton, Linlithgow and other places. That passage was always well secured with drawbridge, stout doors and portcullis, worked from a room above, and was further secured against fire in being arched in stone. From the security of the courtyard the rooms could be safely lighted with large windows, and thus it often happened that these castles had a more cheerful air within than the outward appearance would lead one to expect. Along with these large courtyards, castles and palaces, the old Norman keep plan still retained its place, and in that period the largest of the kind was built at Borthwick. It was worthy of being compared with Norman keeps in size and grandeur. Numerous examples of lesser size were built throughout the whole country. A series of them along the Firth of Clyde appeared to have been built, after a model plan, of about the same size and four storeys high. The arrangement of the hall and kitchen was varied out in each on the same lines. The kitchens consisted of one end of the hall partitioned off. They were perhaps 15 feet or 15 feet long by 4 feet or 5 feet wide, with an arched place of the same size, round which the servants sat. These castles showed a considerable advance in domestic convenience over the earlier keeps, where most of the cooking had to take place in the hall or in sheds outside. Confined and narrow as these keeps appeared now, there was often obtainable a considerable amount of domestic happiness with a sense of security experienced within their walls.

In the sixth and concluding lecture of the course, the fourth and last period of the castellated and secular architecture which prevailed in Scotland before the appearance of the Renaissance at the end of the seventeenth century was considered. After the sudden and unexpected death of James V., the country was destined to suffer the woes predicted for the land whose sovereign was of immature age, there was a distinct cessation of building throughout the minority and short reign of Queen Mary. In the throes of the Reformation expenditure on palaces and castles was a matter of secondary consequence, and comparatively few buildings were erected for many years after James V.'s death. The accomplishment of the Reformation, when the Church lands and other properties passed into the hands of the nobility, there was a great revival of building activity, and under new conditions. The practice of dating buildings now became common, and before this period it was extremely rare in Scotland. It had now become evident that it was useless to build private castles capable of resisting the improved artillery which had superseded the old methods of warfare. The old like aspect of the earlier castles was left aside; the portcullis and the drawbridge were mostly discarded, the bretasche boarding was seldom provided, and even the sites selected were generally more accessible. The early keeps were dismantled from the top. Now they were often covered with steep roofs stretching from wall to wall, in many cases with no room left from which to conduct a defence. Sometimes, as at Borthwick, a small protected space was contrived at each side of the tower, from which defensive operations might be conducted. At other places a single tower was carried up a little higher, with a narrow walk round for this purpose. At some of the border towers there were what might be called small stone sentry-boxes, at opposite ends, for watchers entering from the walk which went round the top of the wall. Sometimes the walk was discarded, these sentry-boxes were entered from the inside of the tower. As gradually as time went on the roof prevailed from eave to eave throughout the whole building, and turrets of a purely ornamental nature took the place of the roof defences. Before the stage was reached an attempt was made in some castles to fit them for the use of big guns with strong platforms and gun-pieces pierced with embrasures, but except in the great royal castles this was not common. Inside the entrance there was a sliding bar for securing the same, and often on a yett. Windows were also heavily grated where accessible by ladders. These, with thick walls, were the kind of defences now generally relied on. But with the common use of firearms in the latter half of the sixteenth century, the Z plan came into use. This consisted of a tower projecting at two of the opposite diagonal angles of the keep, so as to command the two faces each. These towers had always gun-holes, and were characteristic of the latter part of the sixteenth century, consequent on the common use of firearms. This Z plan was very characteristic of the castles of this period, and it admitted of an immense variety of modes of treatment. Sometimes the angle towers were square and sometimes round, and by the device of bringing the latter forms into square forms at the roof an opportunity was given for a display of that wondrous genius for corbelling characteristic of Scottish buildings. Mr. Billings had pointed out that this plan was peculiar to Scotland, and only nowhere else had such a series of Z plans been produced. And the whole architecture of Scotland was a genuine and unchallengeable record of the gradual development of the mind and a true reflex of her history, and from no other

source could such genuine conceptions be obtained of the social and domestic condition of the inhabitants, and the buildings of every period had something about them which marked them as distinct and peculiar to the area of Scotland.

Sir Arthur Mitchell, in moving a vote of thanks to Mr. Ross for his most interesting and instructive course of lectures, said he was sure the audience would join him in expressing to Mr. Ross a hope that they should see both that course and his former course of lectures in book form. Mr. Ross was already the author, in conjunction with his partner, of two great works on Scottish architecture, but they were too large for every man to have in his library, and the desideratum was a book in convenient form, such as might embrace those two courses of lectures, which would be accessible to anyone, and would form a delightful book in any library.

The motion was cordially passed and Mr. Ross briefly acknowledged.

NEW SCHOOL BOARD OFFICES AT CHESTERFIELD.

THE new offices erected by the Chesterfield School Board for administration purposes have just been completed. Designed by Mr. W. C. Jackson, M.S.A., of Chesterfield, and erected by Mr. W. Rhodes, of Brampton, they occupy a site abutting on Foljambe Road, and adjacent to the Central schools in Ashgate Road, and their style of architecture harmonises with that of the school. In the basement of the buildings is a large store-room 30 feet 3 inches by 36 feet, where the stationery and other books for the whole of the schools in the town will be stored. The boiler-room, for heating purposes, is also in the basement. On the ground floor is situated a porch and entrance-hall, waiting-room, 24 feet 6 inches by 12 feet; the general office, 24 feet 6 inches by 22 feet 3 inches; the secretary's private office, 20 feet 9 inches by 12 feet; lavatory and back entrance porch. These rooms form an inner square of the building proper, and a corridor runs round two sides of this square, giving private access to each of the three rooms. They also open into each other. On the upper floor, where the inner square is continued, the main portion of the space is devoted to the committee-room, 24 feet 6 inches by 22 feet 3 inches. The present Board numbers nine members, but the room which, but for the new Education Act, the Board would have occupied in the new offices, has accommodation for twenty members. The education committee which will shortly take possession of the new offices will require all the accommodation that this commodious board-room will afford. This room is too small to be used as the council chamber for the Corporation meetings, but it has been suggested that an adjoining room 24 feet 6 inches by 13 feet, which is designed as a waiting-room for the parents appearing before the Board with regard to school attendance, should be added. There is on this floor a second waiting-room 20 feet 9 inches by 12 feet, together with a lavatory and conveniences. Sufficient provision has been made for the Press. The offices are lighted throughout by electricity. The total cost of the new offices and adjoining caretakers' houses, exclusive of land and furniture, was 2,211*l.*, and including these 2,800*l.*

INSTITUTE OF BRITISH DECORATORS.

THE annual dinner of the Incorporated Institute of British Decorators was held on Monday night at the Trocadero Restaurant. The president (Mr. J. D. Crace) was in the chair, and amongst those present were Mr. Mawer Cowtan, Mr. J. R. Riley (president of the National Association of Master Painters of England and Wales), Colonel Bennett (of the Association of Master Painters in Scotland), Mr. Alderman John Smith, Mr. J. C. M. Vaughan, Mr. J. Preston, Mr. W. H. Pitman and Mr. F. W. Englefield (secretary).

Mr. W. G. Sutherland, in proposing "The Incorporated Institute of British Decorators," said the Institute was the apex of a movement which began some ten years ago. The first idea of the Institute came from Scotland, but the scheme was taken up with great enthusiasm by Englishmen and Irishmen. He thought that no little part of this was due to the fact that they were associated with the Painters Stainers' Company, and it was also largely owing to their being so fortunate with their first and only President, who he hoped would hold that position for many years to come, and whose name was known throughout the entire kingdom as the representative of a long line of artists and decorative artists. Their membership was nearly 400.

The President, whose name was coupled with the toast, said they must look to the gradual growth and consolidation of the Institution rather than to present results. Although the National Association appealed more immediately to the material advantage of the decorator, they must look to the Institute to assist in establishing higher intellectual relations.

between decorators. He thought they might look back on the work of the Institute during the past year with some satisfaction. He appealed to those present to encourage their friends in London to join it in greater numbers.

The toast "The National Association of Master Painters of England, Scotland and Wales" was also drunk.

Engineering Standards.

SIR,—I beg to enclose copy of correspondence which has passed between the Board of Trade and this committee, and in view of the importance of the subject to the trade of the country, I should be glad if you could publish the two letters in your next issue.—I am, sir, yours faithfully,

LESLIE S. ROBERTSON, Secretary.

The Engineering Standards Committee: April 3.

Board of Trade (Railway Department), 7 Whitehall Gardens, London, S.W.: March 24, 1903.

Sir,—Referring to your letter of November 25 last on the subject of the grant desired in aid of the funds of the Engineering Standards Committee, I am directed by the Board of Trade to state that they laid the request of the committee before the Lords Commissioners of His Majesty's Treasury, and urged in support thereof that the work being carried out by the committee is of the greatest importance, and one that might well be encouraged by the State.

In response, the Treasury have expressed their willingness to include in the Board of Trade Vote for 1903-4 a sum of 3,000*l.* as a contribution to the funds of the committee for that year only, on the understanding that they are not thereby pledged to continue the grant in later years.

After the sum has been voted by Parliament for the purposes of the committee, the actual expenditure under the vote will have to be authorised by this department on the recommendation of a committee, which should be specially appointed for the purpose by the Institution of Civil Engineers, and should contain one *ex-officio* representative of the Board of Trade.

In conveying to the Engineering Standards Committee the decision come to by the Treasury as to the grant to be made, the Board of Trade desire me to state that they regard the work undertaken by the committee, including as it does the preparation of standard specifications for engineering works, and of standard sections of rolled iron and steel, together with the standardisation of parts of locomotives and electrical appliances, as tending to reduce both the cost of production and the time occupied in completion, and as being of the highest value to the country at large.—I am, Sir, your obedient servant,

FRANCIS J. S. HOPWOOD.

Leslie S. Robertson, Esq., Engineering Standards Committee, 28 Victoria Street, S.W.

April 3

Sir,—I have the honour to acknowledge the receipt of your letter of the 24th ult., informing me that the Lords Commissioners of His Majesty's Treasury have included in the Board of Trade Vote for 1903-4 the sum of 3,000*l.* as a contribution towards the funds of the Engineering Standards Committee for that year, and stating that the actual expenditure under the vote would have to be authorised by the department on the recommendation of a committee which should be specially appointed for the purpose by the Institution of Civil Engineers, and which should contain one *ex-officio* representative of the Board of Trade.

The main committee have had this letter under consideration, and desire me to say that nothing would be more agreeable to them than the appointment of representatives of the Institution of Civil Engineers and of the Government to advise as to the actual expenditure under the vote.

The committee have communicated your letter to the Council of the Institution of Civil Engineers, with the result that that body is prepared on behalf of the Institution to deal with the question of making recommendations as to the expenditure under the vote in accordance with the terms of your letter. I am informed that the committee in question will consist of the following:—

The President and the senior Vice-president of the Institution of Civil Engineers; Mr. James Mansergh, F.R.S., Sir John Wolfe Barry, K.C.B., Sir William Preece, K.C.B., Sir Benjamin Baker, K.C.B., and Sir Douglas Fox, past presidents of the Institution; Mr. Archibald Denny, M.Inst.C.E., with a representative of the Board of Trade.

The secretary of the Institution will no doubt communicate with you in regard to the matter, and I shall be glad if you will

kindly inform me whom the Board of Trade propose to appoint as their representative.

The committee desire to take this opportunity of putting on record their appreciation of the Government's desire to assist the trade of the country by placing at their disposal not only financial support, but also the valuable services of representatives of the various Government departments.

The committee venture to hope that when the present vote is exhausted the Government will favourably consider the desirability of further assistance, as they attach very high importance to the necessity of organising a permanent body which shall keep in touch with the scientific and practical development of the trades concerned, and be prepared to revise the standards by addition or deletion, and to modify the methods of testing as necessity may arise.—I have the honour to be, Sir, your obedient servant,

LESLIE S. ROBERTSON, Secretary.

The Assistant Secretary (Railway Department),
Board of Trade, Whitehall, S.W.

GENERAL.

Princess Henry of Battenberg presided last Friday at a special meeting of the Governors called to consider the reports and plans of Mr. T. W. Cutler, for remodelling the Royal Isle of Wight County Hospital at an approximate cost of 18,292*l.* The scheme was divided into three sections, and it was resolved to proceed with the carrying out of the first two, including the building of a sanitary tower, the revision of the sanitary arrangements, and the erection of new isolation wards and a fireproof staircase. The estimate for this work, exclusive of architect's charges and contingencies, was 6,000*l.*

The Society of Berlin Architects have decided to co-operate in the preparation of an architectural section in connection with the international exhibition at St. Louis, United States. Efforts will be made to trace the characteristics of German architecture from early ages, as it is believed Americans are not sufficiently acquainted with the subject.

The Royal Society of Painter-Etchers and Engravers have elected as Fellows Mr. G. W. Eve and Mr. W. L. Wyllie, A.R.A.

Mr. Joseph Mordecai is painting a full-length portrait of the King, for which His Majesty gave a sitting last week.

The Exhibition of Saxon Art in Dresden is expected to be opened with much ceremony by the king in May.

The Plans for the new libraries and academy buildings which are to be erected in Unter den Linden, Berlin, are in course of preparation by Herr Ihne. The construction will be directed by Herr Adams, and it is expected the works will be completed in five years.

Sir Ernest A. Waterlow, B.A., was elected last week by the committee of the Athenæum Club as one of the three gentlemen under the provisions of Rule II. of the Club, which empowers the annual election by the committee of nine persons "of distinguished eminence in science, literature, the arts, or for public services."

A Contract has been entered into for the erection of the first portion of the buildings which will comprise the Sanatorium for Consumptives at Winsley, near Bath, which is to be used by patients of Gloucestershire, Somersetshire and Wiltshire. The total amount already subscribed and promised is 9,351*l.* Of this sum nearly 4,000*l.* has been spent, mainly upon the acquisition and levelling of the site. The contract now to be entered into is for the erection of the administrative block for sixty patients, with beds for twenty patients, the bedroom accommodation to be afterwards extended as funds permit. The amount of the contract is 6,877*l.*

The British Government have purchased 9 acres of land for about 900,000 dollars to erect a building for the British Embassy at Washington. The owners of the land once refused the sum of 1,000,000 dollars offered for the site by the United States Government for the erection of a new White House.

Varnishing Day at the French Salon will be Wednesday next. M. Loubet will be unable, on account of his departure to Algiers, to inaugurate the exhibition, but he has promised an official visit on his return.

Mr. A. J. Cooke, architect, Montreal, died in that city on February 23 last. He was a native of London, but went to Canada in 1883.

Dr. James Stevenson, of Glasgow, has bequeathed his Lipari antiquities as well as a painting, the *English Homestead* by Morland, to the Glasgow Corporation.

Mr. William Botterill, who for half a century practised in Hull as an architect, died on the 2nd inst. in his eighty-third year.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding £5,000. Premiums of 60l., 25l. and 15l. will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BLACKPOOL.—June 30.—The Corporation of Blackpool offer premiums of £100, £50, £30 and £20 respectively for designs for new picture poster. Mr. C. Noden, Corporation advertising manager, Town Hall, Blackpool.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60l. and 30l. are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000l. Premiums of 75l., 50l. and 25l. respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper baths to be erected in Windsor Road, New Brompton. Three premiums are offered, one of £20 to the author of the design which is considered to be the first in order of merit, one of £10 and one of £5 respectively for the second and third. Mr. F. C. Boucher, clerk, New Brompton, Kent.

STOCKTON-ON-TEES.—May 13.—Designs are invited for a girls' high school, to be erected as a memorial of Her late Majesty Queen Victoria, at a cost not exceeding 5,000l. Premiums of 25l., 15l. and 10l. respectively will be awarded. Mr. C. J. Archer, 77 High Street, Stockton-on-Tees.

TRADE NOTES.

MESSRS. ANDREW HANDYSIDE & CO., LTD., of Derby and London, makers of steel bridges, roofs, buildings and structures, have recently completed a large steel framed joiners' shop for the Palmer's Shipbuilding Co., Ltd., Jarrow-on-Tyne. The building consists of three floors, and covers an area of 14,000 feet. The weight of the structural work was 200 tons.

MESSRS. POTTS, clock manufacturers, Leeds, are erecting a new chime clock and bells at the Wesleyan College, Apperley Bridge, Bradford. The same firm have also a new illuminated striking clock for Reeth Congregational church, North Yorks, given by the Yorkshire Congregationalists to celebrate the Coronation, and the clock and bell for the Macgregor Memorial Church, Govan, N.B.

THE large clock of Heanor Church, Derbyshire, has just been renovated and Cambridge chimes added by Messrs. John Smith & Sons, Midland Clock Works, Derby, who made the clock thirty-two years ago; and the same firm are also making a large chiming clock for Swanwick Church, near Alfreton, for Mr. Fitzherbert Wright.

MESSRS. MELLOWES & CO., of Sheffield, and 28 Victoria Street, London, have received the order for covering with their patent "Eclipse" glazing the roofs over Lostock Hall station for the Lancashire and Yorkshire Railway; the Royal Naval College, East Cowes; the electric station for the Leek Urban District Council; extensions to shops for Messrs. J. H. Andrew & Co., Sheffield; extensions to shops for Messrs. Leys, Derby, and for the whole of the plumbingwork at the new shops at Derby for Messrs. Leys.

AN innovation is about to be carried out in two blocks of residential flats now in the course of completion and known as Hurlingham Court Mansions, Hurlingham, S.W., in the form of a roof garden, which will give the tenants an uninterrupted view over the Hurlingham Polo Club and surrounding scenery, which is very picturesque. The contractor for the new buildings is Mr. William Watson, of Ascot. Messrs. Palgrave & Co., of Westminster, are the architects.

A NEW reservoir, constructed on the river Avon, near Brownsover Mill, has been opened. The work, which has been carried out by Mr. J. Young, of Rugby, cost 8,000*l.*, and was commenced about fifteen months ago.

WAPICTI

A SANITARY WASHABLE DISTEMPER OF BRITISH MANUFACTURE.

PRODUCES A MUCH MORE PLEASING EFFECT THAN FLATTED OIL PAINT, AT ONE THIRD THE COST.

"WAPICTI" can be made in any Tint, and is adapted for application to Plaster, Stucco, Brick, Stone, Cement, Wood, &c.

FOR INSIDE OR OUTSIDE WORK.

"WAPICTI" may be used over Oil Paint, or Oil Paint may be applied over it.

THE NORTH PORCH.**BUILDING AND BUILDERS.**

THE parishioners of Eccleston purpose erecting a parish room in connection with the Christ Church mission schools, and the Earl of Derby has offered them a site for it at a nominal charge.

OWING to the damage to the sea defence works at Lowestoft by the recent storms it is calculated that if the cliffs are to be saved it will be necessary to incur an outlay of 80,000£. in new defence works.

THE town clerk of St. Helens, Lancs, reported to a meeting of the gas and lighting committee that the Local Government Board had sanctioned the borrowing of the sums of 5,901£. and 99£. for the purchase of land and buildings for the new gas-works at Pocket Nook.

A LOCAL GOVERNMENT BOARD inquiry has been held by Colonel Hepper into the application of the Wolverhampton Town Council for sanction to borrow 13,580£. for the erection of a refuse destructor. Mr. R. E. W. Berrington, chairman of the health committee, and Mr. George Green, A.M.I.C.E., borough engineer, gave evidence in support of the application.

A LOCAL GOVERNMENT BOARD inquiry has been held by Mr. A. A. G. Malet into the application of the Heath Town Urban District Council for sanction to borrow 3,000£. for sewerage and sewage disposal works, and 300£. for the purchase of certain land for the purposes of a refuse tip. Mr. R. E. W. Berrington, of Westminster and Wolverhampton, gave evidence on behalf of the Council.

A DETERMINED effort is being made to restore the ancient ruined church of St. Mary, Burgh Parva, for the convenience of the inhabitants of that parish and Melton

Constable. Some such provision has been rendered necessary by the rapid growth of the parishes owing to the railway works at Melton Constable. It is proposed to retain the tower and as much as possible of the old walls, at the same time enlarging the building to accommodate 300 worshippers. Lord Hastings has promised to give whatever additional land is required. Suitable plans have been prepared by Mr. George Fox, A.R.I.B.A., who estimates the cost at 3,000£. Meanwhile, to meet the urgency of the case, a temporary iron church has been erected on the south side and adjacent to the ruins.

AN imposing building, to be called Queen's Court, is about to be erected in the Moscow Road, Bayswater, under the direction of Messrs. Palgrave & Co., architects, Westminster. The building will consist of thirty self-contained residential flats, ranging from six to eight rooms. The building will be approached by an ornamental garden court laid out with carriage-drive, fountain, &c. The elevations will be carried out in red bricks with gauged brick aprons, arches, &c., and the roofs covered with green slates. There will also be electric passenger lifts to all floors. Mr. C. Gray, of West Hampstead, is the contractor; Mr. George Stephenson, of Queen Victoria Street, E.C., the quantity surveyor. The estimated cost is 30,000£.

ELECTRIC NOTES.

A LOCAL GOVERNMENT BOARD inquiry has been held at Warrington into an application by the Corporation for power to borrow 20,000£. for extensions at the electric-lighting station, Howley. The money is to be spent entirely on additional plant in order to meet the increasing demands for electricity for lighting and power purposes.

AFTER consideration of twenty-five tenders submitted by ten firms for 100 double-decked bogie-truck tramcars for the New Cross to Greenwich section of the London County Council electrical tramways, the highways committee have decided to recommend the Council to accept that of the British Westinghouse Electrical and Manufacturing Company for 65,968£., the first fifty cars to be delivered in twenty-two weeks, and the remainder in twenty-eight weeks. This firm will sublet portions of the work—to the European McGuire Manufacturing Company, the manufacture of the car-trucks; the Brush Electrical Engineering Company or the British Electric Car Company, the manufacture of the car-bodies; Messrs. A.

Reyrolle & Co., the manufacture of the car-ploughs; and to the British Thomson-Houston Company the manufacture of the watt-meters. The same firm's tender of 52,912*l.* for 100 single-truck cars was also accepted. Messrs J. G. Brill & Co., Philadelphia, U.S.A., will supply the car-trucks, the Brush Electric Engineering Company or the British Electrical Car Company the car-bodies, Messrs. A. Reyrolle & Co. the car-ploughs, and the British Thomson-Houston Company the watt-meters.

VARIETIES.

WE understand that Mr Edward Barlow, a director of and for many years connected with Messrs. Hampton & Sons, will continue to occupy the same position in the firm under the new arrangement.

NEW Board schools were opened at Pontnewynydd last week. They were erected by Messrs. Bailey Bros., Pontnewynydd, at a cost of 12,000*l.* The mixed school can accommodate 480 and the infants' school 295 children. The buildings occupy an elevated position overlooking the valley, and are modernly equipped.

THE new fire station in Blackstock Road, Finsbury Park, was opened on the 2nd inst. The building, designed by the Council's architect, Mr. W. E. Riley, and constructed by the works department, has cost 11,620*l.* It is furnished with a steam fire-engine, a horsed escape, and besides accommodation for these and other appliances and stabling, has living rooms for the staff of a station officer, nine firemen and two coachmen. The building has taken almost exactly a year to complete.

AN exhibition will be held in Dresden from May 20 to September 30, 1903, which has for its object the study of improvements in municipal government and welfare. This will include streets, street paving and cleaning, sewers and drainage, gas and electric lighting, bridges, harbours, parks, schools, hospitals, police, cabs, automobiles and kindred subjects. Invitations are sent to the prominent cities abroad. For details of the exhibition interested parties should address the Oberbürgermeister, Gch. Finanzrath a. D. D. Beutler, Dresden, Saxony.

A LOCAL GOVERNMENT BOARD inquiry has been held by Colonel Slacke, R.E., into the application of the Town Council of Bewdley for sanction to borrow 2,000*l.* for waterworks pur-

poses. The scheme has cost, including house connections, a total of 14,000*l.* The water is obtained from a borehole in the new red sandstone, and a supply far in excess of the demands of the town has been procured. Evidence in support of the application was given by the engineer to the scheme, Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Wolverhampton.

SOME 600 ratepayers of Lambeth assembled at Brixton Hall and passed a resolution protesting against the proposed purchase of a site at the corner of Acre Lane and Brixton Hill for a new town hall, at a cost of 25,000*l.* Mr. J. S. Price, who presided, said that the ratepayers of Lambeth did not want a new town hall, which would, together with the proposed site and the building of the hall and offices, cost nearly 150,000*l.* This would come out of the pockets of the ratepayers, who at the present time pay something like 7*s.* 10*d.* in the pound. The hall at Kennington Green had suited 120 vestrymen, why could it not suit sixty councillors? A petition had been forwarded to the President of the Local Government Board signed by several thousand ratepayers objecting to the scheme.

THE annual exhibition of scholars' work from the Board schools of London will be held at the Examination Hall, Victoria Embankment, W.C. (adjoining Waterloo Bridge), on Saturday, May 9, and on the following Monday, Tuesday and Wednesday (May 11, 12 and 13). The exhibition will be opened by Lord Reay, G.C.S.I., G.C.I.E. (chairman of the Board), at 12 o'clock noon, and will include specimens of drawings, colourwork, modelling, science apparatus, wood-carving, metalwork, needlework, infants' work, cookery, laundry-work and housewifery from the day and evening schools, and also work from the schools for the blind, deaf, special instruction, truant and industrial schools. Arrangements will also be made for various classes at work in practical cookery, laundry-work, &c., during the daytime, and gymnastics, dramatic literature, &c., in the evenings.

THE foundation-stone of Bury Park Congregational church, Luton, Beds, was laid on Tuesday, March 31. The accommodation provided is as follows:—468 adults on ground floor and 65 in end gallery; total, 533, or a mixed congregation of about 610 persons, with possible future galleries in transepts and over vestries for 160 more sittings, or a final total of over 800 sittings in a mixed congregation. A large church parlour, vestries and other conveniences are provided. The buildings to be faced with red brick, with Costessey brick

ings; joinery internally stained transparent green and polished; red granite columns supporting four crossing arches; lead lights richly coloured; green slates; heating by pressure pipe apparatus and best ventilating appliances. The contract is let to Messrs. T. & E. Neville, of Luton, and amounts to 4,420*l*. The architects are Messrs. George & R. P. Jones, 5 Clement's Inn, Strand, London, W.C.

A MEETING of the East of Scotland Engineering Association was held in 20 George Street, Edinburgh, Mr. James D. Thomson presiding, when papers on dock working and construction were read by Mr A. C. Cormack and Mr. A. W. Cockburn, C.E. Mr. Cormack described the various methods of loading and discharging vessels at various ports, including the use of coal, the unloading of grain, jute, &c., and the appliances used in connection therewith, illustrating his remarks with a series of limelight views. Mr. Cockburn took up the question of dock construction, giving examples of the general arrangement of various docks, dock and quay walls, &c., and concluded with a short description of the construction of No. 3 Floating Dock, Glasgow. His address was also illustrated by limelight views. The authors were accorded a vote of thanks for their papers.

A MEETING of the Berks Archaeological Society was held at Abbey Gate, Reading, on the 2nd inst., an interesting lecture being given on "English Village Life, Ancient and Modern," by the Rev. P. H. Ditchfield. The chair was taken by the Rev. Canon Saye and Sele, and there were also present the Rev. Canon Newhouse, Rev. and Mrs. Morris Williams, Rev. J. C. Ditchfield, Rev. Alan Cheales, Rev. J. H. Firminger, Rev. Canon Ward, Mrs. Williams, Mrs. Climensohn, Miss Monck Smith, Miss Ditchfield, the Misses Hissey, Mr. F. A. Sarjeant, Mr. J. White, Mr. L. L. Treacher and Miss Treacher, and Miss Ditchfield. The attendance was larger than usual, and the Rev. Canon Ditchfield's lecture, illustrated by lantern slides, was very enjoyable. After the meeting the company partook of tea.

ON the 4th inst. the North-western District Centre of the National Union of Sanitary Inspectors held their eighth meeting of the session in Ashton Hall, Ashton Street, Liverpool. Mr. Vacher, the Cheshire county medical officer of health, presided. There was a good attendance. A lecture was given by Mr. T. W. Waddington, sub-inspector, Ribblesdale Joint Sanitary Committee, Preston, on "Methods of Sewage Treatment in the Ribblesdale Watershed." Mr. Waddington dwelt upon every detail of sewage purification under authorities in the neigh-

bourhood of the watershed mentioned. The subject was illustrated with a splendid series of lantern slides, which made the lecture all the more interesting and instructive. Great interest was shown in the descriptions of the lecturer, and he was fervently thanked for his invaluable remarks and illustrations. Other business was transacted during the evening.

MUNICIPAL TRADING.

THE following memorial has been addressed by the Council of the Society of Arts to the Prime Minister:—

Society for the Encouragement of Arts,
Manufactures and Commerce,
John Street, Adelphi, London, W.C. :
March 9, 1903.

To the Right Honourable Arthur James Balfour, M.P., Prime Minister and First Lord of the Treasury.

Sir,—In the year 1899 the Society of Arts addressed a memorial to Sir Matthew White Ridley, as Secretary of State for the Home Department, asking for the appointment of a Royal Commission to consider the question of municipal trading. The Society then ventured to point out that there was an increasing tendency on the part of municipal and local authorities to embark in trading enterprises which might be in competition with, or to the exclusion of, private enterprise; and they drew attention to the fact that no limitations had been defined by Parliament as to the enterprises which should in the general interests of the nation be undertaken by municipalities and local authorities, and those which should be left to private effort.

During the time which has elapsed since the presentation of this memorial public attention has been much directed to the subject. The great and rapid increase in capital outlay by municipalities, and the consequential increasing burden upon the rates, has given rise to the feeling that certain definite principles might be laid down as to the class of undertaking upon which municipalities should enter. Further, it has been contended that the action of municipal authorities has interfered detrimentally with private enterprise in many important industries.

The Society of Arts does not desire to prejudge the subject, but it feels that the question is one for an independent, impartial and authoritative inquiry, such as could be conducted by a Royal Commission alone, and they therefore venture to

Secretary to the Society.

REGISTRATION OF PLUMBERS.

THE Mayor of Sunderland presided at the annual meeting of the North of England District Council for the National Registration of Plumbers, at the town hall on the 2nd inst.

In the course of his remarks the Mayor said the importance of efficient sanitary plumbing in every house and building could not be over-estimated. Every member of a family was brought into contact with plumbingwork, be it good or bad, and too often the traps became traps in another sense in which they were intended, with the consequence that sickness and death followed imperfect workmanship. He quite agreed that all plumbers should be registered, and apprentices should be technically trained and examined before starting business.

On the proposition of Councillor Kirtley it was resolved:—"That this meeting is of opinion that it would be of great public advantage for the Plumbers' Registration Bill now before Parliament to be passed into law. The Bill has for its object the protection of the public from the results of incompetent workmanship, and of securing the efficiency and responsibility of plumbers by means of a system of registration. This meeting is further of opinion that it is the duty of the Government, acting in the public interest, to carry through the measure on the conditions already approved by the Local Government Board. Also, that copies of this resolution be forwarded to the President of the Local Government Board and to local members of Parliament."

A very interesting address on "Technical Education" was given by Professor Branford, M.A., principal of the Sunderland Technical College.

NEW PUBLIC SCHOOL, BIRKENHEAD.

THE foundation-stone has been laid of a new public school which is in course of erection at Birkenhead, and is intended to form a link between the elementary schools and the secondary institution, and eventually the universities. The new schools are being erected in the centre of the town on a site covering 2,870 square yards, fronting Conway Street, and adjacent to the general post office. The buildings provide accommodation for 350 boys and 350 girls, each school being planned in a separate block, connected by means of general rooms common to both departments. The boys' school fronts Conway Street, and the girls' school faces Burlington Street, each school having two entrances from main streets and two from playgrounds. The boys' school consists of ten general classrooms, all grouped around a lofty central hall, and, in addition, rooms for manual instruction, drawing, chemical and physical laboratories, and the usual cloakroom and teachers' accommodation. The girls' school consists of similar general accommodation, and also rooms for cookery, laundry, drawing, chemical and physical laboratories, &c., a lecture-room and dining-room being common to both schools. The general classrooms in both schools are kept away from main streets to insure quiet and good light. Large open and covered playgrounds are provided at the rear. A caretaker's house is arranged on the top floor. The buildings are three storeys in height, the design being Renaissance in character, freely treated. The elevations to main streets will be faced with red Ruabon bricks and buff terra-cotta, the roofs being covered with green Westmoreland slates. The floors and staircases will be of fireproof construction. The general contract is being carried out by Mr. James Merritt, of Birkenhead, for the sum of about 22,000*l.*, from the designs and under the superintendence of Mr. T. W. Cubbon, architect, of Birkenhead, Mr. Henry Helms acting as clerk of works.

THE HORTON ASYLUM.

THE cost of erecting the superstructure of the Horton Asylum has exceeded by 39,500*l.* the architect's final estimate, and the works committee have prepared a report explaining how the excess has occurred. The work—which occupied four years instead of two, as originally intended—was practically completed before the present committee was appointed, and before the present manager entered on his duties. The late manager

a free hand in the acceptance and execution of undertakings, subject to the financial control of the finance committee. He submitted an estimate of 284,445*l.*, being 9,969*l.* more than the sum fixed by the quantity surveyor. It was then decided to advertise for tenders, but eventually, on the advice of the asylums committee, it was agreed that the works manager should erect the building at his price, which was 130*l.* below the lowest tender. The finance committee decided that this recommendation should be reconsidered, but the Council confirmed the order to the works manager to begin negotiations. The actual cost has been 330,500*l.*, and this greatly increased outlay the works committee attribute to:—

Error of judgment on the part of the late manager of works in undertaking the work, and insufficiency of accepted estimate.

Refusal of local authority to allow temporary railway for carriage of materials, &c.

Rise in prices of materials and wages.

Scarcity of labour.

Coming to details, the committee go into the history of the work, and as a result find reasons to account for an additional expense of 40,730*l.*, being a sum greater than the total excess reported. This sum is made up as follows:—

Insufficiency of accepted estimate (difference between that estimate and the lowest tender)	£12,130
Carriage	11,450
Rise in price of materials and in wages	16,150
Scarcity of labour	1,000

£40,730

The committee point out that payments on account during progress of the work not being necessary in the case of works executed by the works department, regular monthly payments were not made. They think that a better result might probably have appeared had some arrangement been in operation whereby the estimated value of the work done could have been regularly determined from time to time, and they are considering as to the steps to be taken with a view to carrying this object in future. They add:—

In conclusion we would point out that it is possible that, if the job had been let out to contract, the quality of the work might have suffered when it was found that the contract prices were insufficient, but from careful inspection of the buildings and knowledge of the materials and workmanship employed

we are satisfied that the Council has received full value for the outlay incurred.

RATING A ROMAN CANAL.

A RATING appeal of some importance came before the Recorder at the Lincoln City Quarter Sessions on Saturday. The appellants were the Great Eastern and Great Northern Joint Railway Committee and the respondents the assessment committee of the Lincoln Poor Law Union, and the appeal was against a poor-rate levied in respect of the Fossdyke Canal. Mr. Bonsey, in opening for the respondents, said that the Fossdyke ran through seven parishes in the Lincoln Union, and was mentioned in the "Encyclopædia Britannica" as the oldest artificial canal in Great Britain. It was made during the time of the Roman occupation of Great Britain, and until 1670 history was somewhat obscure as to what rights, if any, the public had over it, or what was the nature of the use made of it. In 1670 an Act was passed for the improvement of the navigation between Boston and the river Trent, by which the Corporation had power to make navigable the river Witham and the Fossdyke, and to take reasonable rates and tolls. After that the Corporation undertook the maintenance and repair of the Fossdyke, but not of the Witham, and in 1740 the Fossdyke was leased to Richard Ellison for 999 years. In 1845 an Act was obtained which might roughly be called the Ellison Estate Act, enabling Richard Ellison, the trustee, to grant a lease of the Fossdyke navigation, and in 1846 there was a lease to the Great Northern Railway Company, which was transferred to the joint committee (the appellants) in 1879. They had paid rates for a great many years, and now they took up the position that they were not liable to be rated in any sum whatever. Mr. Lush having replied, the learned Recorder said that both sides must take their stand under the Act of Charles II. That Act showed that what the Corporation entered into was more than an easement. He held further that the railway company had a beneficial occupation. He could not understand how the railway companies, admitting that for many years they had paid rates without demur, could yet claim that they were not liable. Still he did not decide the case on that ground at all, but on the ground that the contention that they had no more than an easement was not made out. Judgment for the respondents, with costs. The learned Recorder agreed that a case should be stated.

IRISH INLAYING.

At the present time there is a general desire in this country to assist Irishmen in their efforts to create or revive industries. For all classes of work, especially those in which artistic capability

that of marble inlaying. Work of the kind has a long history behind it. According to Pliny, the Romans were admirers of inlaid work, which some suppose they derived from the East. It was among the arts which were adapted to display the skill of the Renaissance craftsmen in Italy. We can understand

how much admiration would be given to work of the kind by travellers from this country, how commissions for examples followed, and eventually Italian artists would journey to Great Britain in the hope of patronage. Ireland was fortunate in attracting some of the marble-workers, and the refined treatment of one of them, named Bossi, was well adapted to the Classic architecture which was admired in the eighteenth century. The inlaying was mainly applied to chimneypieces, and more examples of the decoration appear to have existed in Ireland than in England or Scotland. The craft has been revived in Dublin through the enterprise of Messrs. Sharp & Emery. We give an illustration of one example which they have lately produced. The delicacy and good taste of the ornament will be manifest at a glance, and the execution is in keeping with the design. That so much excellence is to be obtained in a country where the gentry are indifferent to art is remarkable. Messrs. Sharp & Emery deserve orders from England for their efforts to attain a high standard. There is no better judge of the experiment than Sir Thomas Drew, and we append his remarks, which will convince the most sceptical about the interest of an important industry:—

The wealth of beautiful work of the school of the Italian Renaissance produced in Dublin in Domestic decoration in the eighteenth century is known to some survivors of an older generation who witnessed its waste and destruction in the evil days for art in the early Victorian era. It is appreciated in a present generation by the now rare survivals of beautiful work in ceilings and wall decoration, in stucco, in metalwork, and especially in mantelpieces

INLAID CHIMNEYPIECE.

is required, there is a belief about the fitness of large numbers of the people. One of the most interesting of the revivals is

of exquisite sculpture, in marble and woodwork, and in inlaid marbles in white Carrara.

54 to 58 Castle Street, Long Acre, W.C.

Manufactory: White Lion Street, Long Acre, W.

All this work came to Dublin with foreign emigrants, fugitives after the revocation of the Edict of Nantes, afterwards with Italian settlers brought to Ireland in the eighteenth century by an Earl of Portarlington, and by the famous Earl of Charlemont and other patrons of art among the nobility and gentry of Ireland before the

On the fine mantels and fireplaces which were a fashion among these old patrons of art, a singularly refined school of workmen lavished real genius. Forty years ago such mantels were still abounding in old Dublin houses.

Bad taste and neglect destroyed many, and the modern craze for bric-a-brac hunter and dealer has pretty well swept old Dublin what has survived. What examples remain are known, treasured and treasured. When one comes into the market it takes hands at a large price, which is continually rising.

Among the rarest now are the works of one Italian, Bossi, whose tradition of workmen preserves in memory as having advanced from mere inlay in pattern of one or two diversified motives to inlaying in exquisite colours and in a cement body given only to himself floral and riband devices in entablatures and pilasters. It was, in fact, that same Italian traditional style which an Indian mogul had brought from Italy to Agra long before for the decoration of the world-famed Taj Mahal Mausoleum. Bossi's drawing of Italian Renaissance ornament is admirable, and his reticence and harmonious colour scheme is art. Imitations of him by less-refined followers were variable failures and lapsed into vulgarity. It was, in fact, somewhat irreverent saying of his fellows, preserved traditionally, that there was "but one Creator and one Bossi."
